Yet it was a hasty and false conclusion that, because painters had misused their memories, that faculty must be suspended. Indeed, the most candid impressionists would admit that such abeyance of associations was psychologically impossible. The associations of any human experience may always rise out of latency, must do so, surely, when any habitual act is accomplished. The best we can do is to practise such concentration upon the impression of the moment that relatively the allied cerebral associations are mute. The kind of hypnosis really implied in the impressionistic attitude is impossible, or, if attainable, incompatible with the accomplishment of any conscious act whatsoever. Still, roughly speaking, a high degree of impressionistic abstraction is possible, and without it one cannot become an artist worthy of the name. At bottom, waiving mere studio recipes and themes which are more or less imposed by the spirit of the time, impressionism means, and, except in periods of decadence, always has meant no more than simple loyalty to natural appearances. The arduous endeavor to make mere pigment cope with the complexity of the thing seen, the desire to make the necessary formulas correspond with reality, the renunciation of dull recipes, the purging of the eye as regards indolent, non-visual accumulations of the mind—this has been the straight and narrow way followed by every painter worthy of his salt. The luminists of to-day happen to bulk large and usurp the name and honors because they are innovators in the new themes of sunlight and atmosphere. They well deserve the credit that falls to all archaic craftsmanship, but so far as their temper and methods are not traditional, they are mostly bad.

Since impression is merely realism taken in its true and not in its sordid sense, it represents a stage through which every artist, not wholly fantastical, must pass. To stay in the impressionistic stage is wilfully to dwarf one's self; the only worse thing would be to leave it never to return. Through grappling with nature and life the personality is constantly enriched, and its spoils from experience are unconsciously transformed into patterns akin to the man. Memory is sifting and fining the mass, rejecting here, confirming there. After a time immediate visual experience becomes less valuable for its own sake, being in a manner repetition, than as a stimulus which concentrates this garnered experience upon a given occasion. Necessarily, the pouring of the visual wisdom of a lifetime into a pictorial composition is a rather delicate process, and cannot be hurried. Here dispositions and abilities differ greatly, but, in general, one may say that we hardly know of any great work that has not been incubated deliberately. Misapprehensions have obscured this obvious truth. We talk as if Velasquez painted a masterpiece in a matter of a few hours. We forget that all his great compositions show numerous corrections, that the incredibly delicate texture of his flesh simply cannot be achieved in a single painting, and we forget also to reckon in his thinking before he set brush to canvas. Unquestionably, Monet's Haystacks and Cathedrals and Water Lilies are delightful things, and were painted as the impressionistic law demands, each picture in a few hours' time. But Monet had the steadying effect of a fixed scientific formula, and those enchanting pictures of the Thames which represent his apogee give every indication of being done slowly, thoughtfully, and largely in the studio. In short, the wise artist learns to bring the whole man—and the most and better part of man is memory—to bear. Any other policy is as false economy as to paint with tied hands or wearing colored goggles. If the artist who has not grown out of impressionism into self-reliance falls short of the stature of a complete æsthetic personality, he who has or thinks he has outgrown the need of direct and tonic contact with nature is in peril of fatty degeneration. The ability to command at will the innocence of the eye is to success in art what the capacity to be as a little child is to perfection in Christian character. It is because Señor Sorolla has complacently remained at the stage of trilling scales and astounding arpeggios while the symphonies are waiting to be composed that I must regard him as a virtuoso rather odd and diverting than really worth while.

"Why don't you out with it and say you don't like his painting?" I hear the indignant enthusiast cry. Because I do like his painting. I get from it the keen thrill that a brass band or a deep baritone declaiming the "Holy City" never fails to produce in my eminently sympathetic sensorium. Such impressions have their value, but I do not need to seek them: they frequently come my way. That I have rarely heard quite so fine a polychromatic brass band as that of Señor Sorolla I gladly admit; but I still prefer the orchestra, or even a more tenuous music, that may hint at heights and depths within a life.

"At least he is a consummate technician." For twenty years I have been familiar with his work, and I cannot see in his bravura the signs of the finest execution. It is wonderfully telling which is quite a different matter. Its emphasis is adjusted not to the fine, but to the ordinary eye. The structure of many of these pictures is as vague as their arrangement. A superficial and certainly skilful application of accents takes the place of real draughtsmanship. Everything is a shimmer and an arabesque which have rather slight relations either with the character of the objects or with their atmospheric values. Here we must take issue with most of the writers in this volume. Sorolla has invented a brilliant short-hand which almost attains illusion, but his is emphatically not the vision nor the patience to seize those subtle variations of luminosity by which objects appear nearer or farther. To replace such study he has a whole bagful of vivacious expedients. What does it mean to a painter that many of the pictures and nearly all the sketches simply are disintegrated when transcribed in half-tone cuts of fair execution? Why merely that the values are all false. A little clever handling of the edges of the planes, here and there a dash of inorganic red, or yellow, or blue—such arbitrary oppositions will to a careless eye give a sense of structure where it really is not.

It may seem that I have left rather little of what criticism has regarded as a first rate talent, and that such isolated scepticism requires a fuller substantiation. Well, I have given my reasons, and some of the pictures are at the Metropolitan Museum and the Hispanic Society to prove me right or wrong. Furthermore, a good deal is left even with the proposed reservations, quite enough to account both for the critical and popular vogue of Sorolla. For the motion of things, the dynamic of water, earth, and the figure he has an extraordinary sense. His relish in the energy of appearances is his most winning quality, and were his vision finer and his hand more restrained, this quality might readily lift him to real greatness. As it is, he attains merely the *ad captandum* facility of certain orators

and poets who manage to be uncommonly well adjusted to the common likings.

The joy of life and of the open is strong in the man. To him we owe rare glimpses of sun-soaked strands, we should never otherwise see, of lithe wet figures glistening in the dazzling radiance, of proudly swelling sails saturated with sunshine. These are pleasant things, and for bringing them to our doors we are grateful to the Hispanic Society, and to Señor Sorolla. But subjects and facility and bravura and naïve joy of life all pass, while art remains; and the artists who come to meet us we naturally love more nearly than those that require us to come, perhaps through difficulties, to them. The future historian of the psychology of the throng will marvel that a New York before whom Besnard and Zorn had been brought, which boasted, itself, an Alden Weir and a Childe Hassam, which knew the work of the consummate technician Tarbell, put itself to sheer physical discomfort to get a passing glimpse of the paintings of Sorolla. Since the handsome volumes published by the Hispanic Society will explain the phenomenon only in part, I have been at the possibly unwarranted pains of writing these ungracious paragraphs for a future history of taste.

Frank Jewett Mather, Jr.

THE TWILIGHT OF CHRISTIE'S.

That useful manual, "Art Prices Current," brings the record of all prices attained last winter at Christie's historic auction room. A slight perusal of the lists shows either that there is something wrong with the prices which collectors pay in this country, or something odd about the pictures that are auctioned in London. Both theories, perhaps, have something to commend them, as a few statistics will show.

Last season English landscape robbed the early portrait school of its long supremacy. A dozen Turners were sold. The Burning of the Parliament Buildings, 1834, brought the highest price of the year, £13,125, while Cowes Castle fetched £6,825. The second honors fell to Constable's last picture, Arundel Mills and Castle, at £8,820. In contrast with these figures are the paltry sums attained by the precursors, Crome, twenty sales, and Richard Wilson, twenty-three. Probably only poor and dubious examples were forthcoming.

By virtue of the sale of a Descent from the Cross by Rembrandt at £8,190, the old masters lead the eighteenth-century portrait manufacturers. But with this brilliant exception the old masters are pitifully in abeyance at Christie's. No other of the sixteen Rembrandts sold reached a notable figure. In fact, the only other prices worthy of mention in this field are £5,040 for an Immaculate Conception by Murillo, £2,940 for a Nattier portrait, and £2,415 for Velasquez's familiar presentment of Queen Mariana.

Though far below the records, the English school of portraiture still is the staple of this mart. Of the thirty-seven examples of the great Sir Joshua, two handsomely passed the £5,000 mark. At the Quilter sale, Venus with Piping Boys was knocked down at £6,720, a high price for a canvas not a portrait. One is glad to find Raeburn next, and not only that, but actually for a male portrait, Sir John Sinclair, at £6,570. Eighteen Raeburns were sold, mostly at low prices. Romney and Hoppner, master and pupil, were represented by about a score of pictures each, and stand even at the top figure of £5,460. Gainsborough, certainly the most desirable of the school, appears thirty-one times in the list, but reached only £2,940. The elegant and superficial Lawrence falls far behind at £1,942. Thirty-nine pictures by him were sold. It is surprising to find the greatest of English figure painters, Hogarth, failing to bring £100. But the fifteen examples may have been poor or worse, and in any case the English are hardly up to their greatest painter.

The Barbizon school was steady and without sensational features. Millet's tiny but admirable Goose Girl, a very famous picture, fetched £5,250. A Rousseau landscape went to £4,830—a moderate price for it as things go here. Corot and Daubigny were the favorites, with twenty-five sales each, but at no prices that would look large on Fifth Avenue. The sterling landscapist Troyon sold eleven times, with a top figure of £2,677. The Pre-Raphaelite list is short but impressive. Holman Hunt's Scapegoat reached £2,940. The Bella Mano, by Rossetti, a thing in his most luscious vein, seemed worth £2,400. Frederick Walker's Bathers rose to the truly astounding figure of £3,045, but this engaging painter is the object of a cult. Burne-Jones and Watts appeared only in minor examples, and no high prices were paid.

The plight of the old masters was truly pitiful. With the exception of the few prices already noted, only a River View by Cuyp at £1,764 need be mentioned. You could have had six Correggios without going to ten pounds sterling for any of them, or four Giorgiones by straining that limit a few shillings. Of three Titians none need have cost twenty pounds. Five Holbeins would have come as cheap, or twenty Van Dycks. Below the high price of £30 five Tintorettos were sold. Goya, in five sales, did not surpass £220, though his name is shibboleth in the artistic circles of London. Even the adorable Fragonard no more than crossed the £100 mark.

The absence of the high figures paid in recent years at Christie's is perhaps more significant than the beggarly sums given for resounding names. London is the greatest picture mart of the world, and naturally, as a penalty, attracts the most trash. If one has the slightest acquaintance with the figures at private sales for the year past, it will be evident that the figures at Christie's no longer have barometrical value. Many causes have led to this change. The old masters have been either exhausted or are disposed of through other channels. England once possessed pretty nearly all the Hobbemas there were. A single example was sold at Christie's last winter, and at a base price. The fact speaks for itself. The great sales in England are no longer made in the auction-room. The dealers have so laid their lines that most works of importance must come quietly to them. Whole collections are bought, and gradually the stream that trickles through the auction room is being skimmed of its valuable flotsam. How far the occupation of Christie's by the dealers and the virtual exclusion of the private buyer have discredited that venerable institution we cannot pretend to say. Even more, perhaps, the toleration of bidding in and of factitious records has hurt the London auction business.

It is matter for congratulation that in the best New York art auction-room there is no such admixture of sheer trash as one finds in London. Our market is narrower, but the average is higher. Collectors, too, may well congratulate themselves that here they may enjoy the excitement of bidding in their proper person. The certainty, also, that an auction price really implies a sale and not simply an appraisal for future use is not to be underestimated. If Christie's is, on the plain showing of "Art Prices Current," somewhat in obscuration, it is due not merely to a turn in the business tide, but also to the winking at methods that are not permitted in our first-class auction rooms.

"The Sculpture of the Parthenon," which has been in preparation for several years, is soon to be issued by the trustees of the British Museum. The illustrations include 85 photogravure and 10 collotype plates, measuring 22 inches by 15 inches, and will portray all the known sculptures of the Parthenon. Eighteen plates are given to the principal pediment sculptures, and 234 minor fragments which are photographed on a scale of one-eighth, while the accessible metopes and 156 fragments, on a scale of one-sixth, fill fourteen plates. Sixty-three plates give thirty-four unplaced fragments, on a scale of one-fifth. The text is by A. H. Smith, the keeper of the Greek and Roman antiquities of the Museum.

Worthington Whittredge, well known as a landscape painter and for many years active in art circles in this city, died on February 25 at his home in Summit, N. J. He was born in Ohio in 1820, and studied landscape and portrait painting in Cincinnati after leaving school. In 1849 he went abroad and continued his art studies in London, Paris, Antwerp, Düsseldorf, and Rome, until 1859.

He was at one time a pupil of Andreas Achenbach. After his return to New York he opened a studio in Tenth Street, and became an associate member of the National Academy of Design. He was made a member in 1862, and was president of the Academy for the year 1875-6.

Winckworth Allan Gay, who had done some creditable work in landscape painting, died at his home in West Hingham, Mass., on February 23, at the age of eighty-eight years. He studied under Troyon, in Paris, and in 1850 opened a studio in Boston. He had lived in Japan, China, and India.

Finance.

AFTER-PANIC SPECULATIONS.

The violent speculation which broke out last year, not only on the American stock market but on numerous American commodity markets, was described by many experienced observers as in reality an "after-panic" symptom. By this it was meant that, a year or two after a serious collapse in credit, trade, and industry, the time comes when the psychological effects of panic have worn off; when the consumer discovers that he has been economizing more than was necessary, the merchant that he has allowed his stock of goods to run very low, and the banker that he has restricted his money market operations more than he need have done. This series of discoveries is made when money rates are low because of the trade inertia, and when, as a rule, prices of merchandise are relatively cheap. The consumer, of a sudden, begins to buy. The merchant, feeling this new demand, hurriedly replenishes his exhausted stocks. The banker lays in fresh supplies of borrowed money and of investment securities.

All this means business revival and rising prices, and prices rise all the more rapidly because the speculator, seeing the trend of events, throws his own buying orders into the scale—which he can do the more easily because money is so cheap. The end of such a process, however, is that prices will go too high, business activity relax, and money itself become dear instead of cheap.

It is not in trade alone that this "after-panic boom" is invariably witnessed. Investors and speculators in securities, who have distrustfully kept their money idle since the panic, suddenly realize that their capital has grown. They look about for something to invest in. Some of them will choose high-grade bonds; but many others, as confidence increases, will insist on something with a speculative profit. It is then that the shrewd promoter, or the experienced professional speculator, appears upon the scene, and an era of public speculation is likely to follow.

We saw all this, last summer, in our American markets, and the German Stock Exchanges simultaneously reported excited public speculation in the "industrial shares." London apparently did not follow suit; but within the past two weeks, it has become the focus of interest for the speculative world. The London "outside public" is in one respect peculiar. Its speculative manias are wont to converge on novelties in the field of corporate enterprises, and on a single group of such novelties. Shares of bicycle manufacturing companies held the stage in one notable speculation of the past fifteen years; shares of hotels, in another; of breweries, in another; of African gold mines, in yet another. This time, speculation has suddenly blazed up in London in the shares of rubber-producing companies. The *Evening Post's* London correspondent thus described the episode, last Saturday:

> The movement really began three years ago, in a quiet way, on Mincing Lane, where merchants, who knew what had been done in the tea industry, devoted their attention to the expansion of rubber production, with a view to supplying increasing demands of trade. The actual speculative boom, however, did not begin until last December.
>
> There are now hardly less than two hundred companies whose shares are on the market, with an aggregate nominal capital of say twelve millions sterling. But even this capitalization does not tell the whole story, because many of the rubber shares are standing at premiums of several hundred per cent. Shares of one concern, for instance, with a par value of one pound sterling, started last year at £4½ and rose to £14½. Another concern, whose shares stood last year at 18 shillings, is now quoted at £9¾.
>
> The public is undoubtedly plunging heavily, but it is also taking up and paying for the shares. Indeed, subscription lists of new concerns rarely remain open longer than an hour.

Both the occasion and the argument which are required to start an excited public speculation appear to have been present, this season, in the shares of the rubber companies. The occasion was a plethora of idle capital in London, after two years of slackened trade activity. The argument was the old appeal to the appetite for sudden and fabulous profits, in an industrial market concerning which the public was wholly ignorant. A sort of hand-book of the rubber trade has lately gained enormous vogue in London. Its main contention is that capital devoted to planting rubber trees, on the other side of the world, will in five years be earning 33 per cent. on the investment, and in eight years 100 per cent. and upward. It is not improbable that the figures are reasonably close to the facts, in the case of a genuine investment of capital by people familiar with the business and able to give it their attention. But to dispassionate observers, it is clear enough, first, that buyers of the shares are dealing in

6% Reclamation Bonds

Secured by a Thousand Farms

The trend of investment among our thousands of customers is toward Reclamation bonds. With us, these bonds are now outselling all other bonds combined.

They are secured by first liens on good farm land—sometimes a thousand farms. And this land reclaimed by drainage or irrigation is the most fertile farm land in America.

The bonded indebtedness is conservative, rarely exceeding one-fourth the land's value. And, the bonds being serial, this indebtedness is rapidly reduced.

As additional security, we have a first mortgage on all the property of a corporation in which the investment is sometimes twice the bond issue. Thus we combine corporate responsibility with farm lien security.

Some of these bonds are "Carey Act" bonds, where the State supervises the project. Some are municipal securities, issued by organized districts. Such bonds form a tax lien on the district.

The interest rate is six per cent.—a liberal rate for high grade farm lien securities. The bonds are for $100, $500 and $1,000, so they appeal to small investors and large. And the differing maturities enable one to make short-time or long-time investments.

For all of these reasons, rightly selected Reclamation bonds have come into great popularity.

16 Years' Experience

During the past 16 years we have sold 78 separate issues of Reclamation bonds, all based on farm liens. Not a dollar of loss has resulted to any investor.

Our position in this field gives us the pick of these projects. To investigate and supervise them, we employ the most competent engineers and attorneys. And an officer of our Company constantly resides in the irrigated sections, watching the projects we finance.

Every investor, small and large, should read our book on Irrigation bonds. Cut out this coupon as a reminder to send for it. (18)

things which they do not understand; secondly, that the real pioneers in the industry are using the present boom to "unload" their own shares at immensely inflated prices, and, thirdly, that a host of more or less suspicious new rubber enterprises are being hastily capitalized and dangled before the excited outside investor.

Such a situation is not new, and its outcome is not doubtful. The only point which invites either conjecture or dispute is what the occurrence of the mania at exactly this moment means, in a larger way. Probably it is merely London's duplicate to the phenomena which the conditions of the day created in Wall Street during 1909. The American speculator has not London's taste for a limited group of shares at such a time; yet, after all, it was "Steel," rather than the stock market as a whole, which engaged attention during the twelvemonth past. If London has to-day its literature regarding "rubber," and its extravagant ideas of net returns, Wall Street last summer had the same paraphernalia for steel. By way of precedent, it is not to be forgotten that it was in a parallel season, two years after a year of world-wide panic, reaction, and liquidation, that the English public of 1895 rushed with unprecedented fury into the newly promoted "Kaffir shares."

Scribner's Notable Spring Publications

Privilege and Democracy in America **By Frederic C. Howe**

Author of "The City: The Hope of Democracy;" "The British City: The Beginning of Democracy," Etc.

In this work, Mr. Howe takes up the problems which now chiefly oppress this nation—those of monopoly, conservation, etc. He shows how this country, like Rome and other empires of the past, has spread over all available lands; how these lands and resources once annexed are swiftly accumulating in the hands of a few and how, there being no more territory for the overflow, the classes that have and have not are coming into critical opposition.

His exposition of conditions will shock many; the remedies he suggests and his lucid cogency will convince many; the spirited manner of his writing will interest all. *12mo, $1.50 net; postage extra.*

Modern Belief in Immortality **By Newman Smyth, D.D.**

AN ADMIRABLE EASTER PRESENT

A stimulating discussion of the grounds of belief in the immortality of the soul, clear, impartial, convincing. New arguments drawn from the scientific research and discovery of to-day are emphasized. Indeed, the familiar arguments, now worn threadbare, are abandoned entirely, and recent revelations of science are the basis for reasonings impressive with sincere earnestness, yet bright with the easy concise manner of the writer, and with the aptness of his similes. *75 cents net; postpaid, 80 cents.*

The Epochs of Philosophy **Edited by John Grier Hibben, Ph.D.**

A remarkable series of thirteen volumes, written by the most distinguished authorities of the United States and Great Britain, which aims to present the significant, permanent features of philosophic thought in the chief period of its development. A work of great magnitude and scholarship.

THESE FIRST TWO VOLUMES JUST PUBLISHED.

STOIC AND EPICUREAN. By R. D. Hicks, Fellow of Trinity College, Cambridge. An illuminating comparative study of the two great schools. *12mo, postpaid, $1.65.*

THE PHILOSOPHY OF ENLIGHTENMENT. Professor John Grier Hibben, Ph.D., LL.D., of Princeton. A book that deals with various aspects of Locke, Berkeley, Hume, Leibnitz, etc. *12mo, $1.50 net; postpaid, $1.65.*

Encyclopedia of Religion and Ethics **Edited by James Hastings, D.D.**

VOLUMES I and II NOW READY

The purpose of this work is to give a complete account of Religion and Ethics throughout the world. It will contain separate articles on every separate religious belief and practice and on every ethical or philosophical idea and custom. Persons and places that have contributed to the history of religion and morals will also be described. It will furnish the materials for a history of human progress or decline throughout the ages of the world and among all the races of mankind. *Vol. II, Cloth, $7.00 net.*

A payment of only $1.00 a month will secure the complete set. Specimen pages and full descriptive circular will be sent free on request.

Revelation and Inspiration **By James Orr, D.D.**

The author of "The Problems of the Old Testament." A scholarly work of interest, as well to laymen as to ministers, remarkable for its breadth of view and clearness of style.

It is one of a series of hand-books for ministers, students, and Bible readers to which belong "A Critical Introduction to the New Testament," by Arthur Samuel Peake, D.D.; "Faith and Its Psychology," by the Rev. William R. Inge, D.D.; "Philosophy and Religion," by the Rev. Hastings Rashdall, D.Litt.

Each volume, 75 cents net.

GRAY'S NEW MANUAL OF BOTANY
Regular 8vo Edition, 926 pp., $2.50
Special Flexible Leather Tourist's Edition, 12mo, $3.00
Revised by Professors ROBINSON and FERNALD of Harvard University
This, the seventh edition of this standard work, has been largely rewritten and rearranged, and its scope considerably widened. The nomenclature follows the code of international rules recently adopted in Europe. As now published, it presents in clear and well-ordered form the scattered results of diffuse publication, and treats its subject with due consideration for the results of the latest investigation. Special care has been devoted to the copious and effective illustration of the work.

Letters and Memorials
OF
Wendell Phillips Garrison
Editor of The Nation 1865–1906

In one volume, crown 8vo, 300 pages, with photogravure portrait.

During the forty-one years in which he edited the *Nation*, with a thoroughness, ability, and conscientious devotion unsurpassed in the records of American journalism, Mr. Garrison was an indefatigable correspondent, never employing an amanuensis, but writing tens of thousands of letters with his own hand to his contributors, who embraced practically all the leading American scholars and critics of the period. From a dozen groups of these, which have been kindly loaned by the recipients, a sufficient number of selections has been made to illustrate the relations between Mr. Garrison and his great corps of contributors, the frankness and tact which he exercised towards them, and the wide range of his interests, tastes, and sympathies. The volume also contains a brief sketch of his life, a dozen of his best poems, and several of his characteristic editorials, reviews, and essays, besides a fine photogravure portrait. It likewise preserves the notable letter of appreciation addressed to Mr. Garrison by more than two hundred contributors to the *Nation* on the completion of his fortieth year of service, and his acknowledgment thereof.

Ready March 11

AN ADMIRAL'S LOG

By Rear-Admiral ROBLEY D. EVANS, U.S.N. (retired)

The account of Admiral Evans's sojourn in the Philippines; of his visit to China at the time when the allied armies were encamped before Pekin; of the visit of Prince Henry of Prussia to this country, during which Admiral Evans acted as his personal escort at the special request of the German Emperor; and, at the end, the detailed story of the famous cruise of the Atlantic Fleet from Hampton Roads, with the description of the festivities and welcome accorded to it.

Illustrated. 8vo, decorated cloth cover. $2.00 net.

A special limited edition in fine binding. Each copy signed by Admiral Evans. $5.00 net.

Volume VII. Ready March 18

A HISTORY OF THE PEOPLE OF THE UNITED STATES

By JOHN BACH McMASTER, Ph.D.

Professor of American History, University of Pennsylvania

This volume brings the history down to 1852, telling of one of the most vital periods in the history of the country. It includes the extraordinary growth of civilization throughout the land, which began just prior to the outbreak of the Civil War, as well as the Ante-Bellum controversies, the beginnings of the West, and the great commercial and shipping development led by New England.

Adequately illustrated. 8vo, cloth, gilt top. Per volume, $2.50 net.

To be Published April 1

THE AMERICAN PUBLIC LIBRARY

By ARTHUR E. BOSTWICK, Ph.D.

Librarian St. Louis Public Library, Late Librarian New York Free Circulating Library and Brooklyn Public Library, etc.; President American Library Association, 1907-08.

For the general reader, for the librarian, who will find in it a grouping of facts and a mode of treatment that may be suggestive and interesting; for the young library assistant, and for the student in library school or training class, who will find in it, not an exhaustive treatise on library economy, but rather a bird's-eye view of the subject.

Illustrated. 12mo, cloth. $1.50 net.

The New North

By AGNES DEANS CAMERON. The travels of two women down the Mackenzie River from Athabasca Landing in Alberta, Canada, to the Arctic Ocean and back by the Peace River. 100 illustrations from photographs. 8vo, cloth, $3.00 net.

The Junior Republic: Its History and Ideals

By WILLIAM R. GEORGE. The founder of the Junior Republic tells of the inception of the idea, the development of the Republic, and its successful fulfilment. Illustrated. 12mo, cloth. $1.50 net.

The History of French Literature

By ANNIE LEMP KONTA. Mrs. Konta takes up the discussion of French literature chronologically from the oath of Strasburg to the publication of Rostand's "Chantecler."

8vo, cloth, gilt top, uncut edges. $2.50 net.

Women in Industry

By EDITH ABBOTT, Ph.D., University of Chicago. The author traces the growth and development of the employment of women from the earliest periods of American history to the present day.

Large 12mo, cloth, gilt top. $2.00 net.

Francis Joseph and His Times

By the Right Hon. Sir HORACE RUMBOLD, for many years British Ambassador to the Emperor of Austria. A very important contribution to the political history of Western Europe. Sumptuously bound and illustrated. Demy 8vo. $4.00 net.

Army Letters From an Officer's Wife

By FRANCES M. A. ROE. An excellent record of the daily and eventful life of the wife of an army officer in the far West thirty years ago.

Many illustrations. 12mo, cloth. $2.00 net.

Romanticism and the Romantic School in Germany

By ROBERT M. WERNAER, Ph.D., formerly Instructor in Harvard University. An historical exposition and a comprehensive study of the writings of the Romantic School in Germany.

8vo, cloth, gilt top, uncut edges. $2.00 net.

Girl and Woman

By CAROLINE LATIMER, M.D., M.A., formerly Instructor in Biology, Woman's College, Baltimore, Md. A sane, wholesome, optimistic text book for the guidance of mothers and daughters.

12mo, cloth. $2.00 net.

The New Macmillan Books

Gertrude Atherton's *new novel*

"Ordham and Margarethe Styr are persons conceived and presented with extraordinary clearness and power. One does not doubt that the bond which unites them . . . is the supreme bond which has linked the great lovers of all time."—*The Nation.*

Tower of Ivory

"Brilliantly written especially are the pages of description of life on the Isar, the music world, the musical idiosyncrasies of the mad king of Bavaria, above all, the sound dramatic criticism of Wagner . . . a masterpiece."—*Record-Herald,* Chicago.

Dr. Henry van Dyke's *new book* The Spirit of America

A notable interpretation of the national character, a keen analysis of the sources of weakness as well as of strength; a presentation of the results of a lifetime's observation as remarkable for its substance as for its fine charm of manner. *The Chicago Tribune's* critic says that to take up the book is "like stepping into another and better world."

Cloth, $1.50 *net; postpaid,* $1.61

APPROPRIATE BOOKS FOR EASTER GIFTS

Bishop William Croswell Doane's The Book of Easter

With an accompaniment of decorative drawings by George Wharton Edwards. A collection of many things which have been written of the great spring-festival—a book as redolent of lilies and daffodils as its companion volume, of Mr. Mabie's "The Book of Christmas," was of holly and pine.

Cloth, illustrated, $1.25 *net; postpaid,* $1.35

Dr. Andrew M. Fairbairn's Studies in Religion and Theology

The most notable work on the church in idea and history in years. As an Easter gift any clergyman should welcome it. *Cloth,* $3.50 *net; postpaid,* $3.68

Pres. Henry C. King's The Ethics of Jesus

By the author of "Rational Living," "The Seeming Unreality of Spiritual Life," "The Laws of Friendship," etc. *Cloth,* $1.50 *net; postpaid,* $1.60

Dr. Samuel G. Smith's *studies of* Religion in the Making

Interpret the Bible by the methods of sociological investigation; the results are illuminating.

Cloth, $1.25 *net; postpaid,* $1.36

Dr. Horace G. Underwood's *account of* The Religions of Eastern Asia

Explains the theistic conceptions of Taoism in China, Shintoism in Japan, and the Shamanism of Korea and of the widespread cults of Buddha and Confucius.

Cloth, $1.50 *net; postpaid,* $1.61

Charles G. D. Roberts' *new stories of* Kings in Exile

Cloth, $1.50

Unusual stories of animal life—thoroughly fascinating.

Jack London's *short stories* Lost Face

By the Author of "The Call of the Wild."

Cloth, $1.50

Mrs. Voynich's *new novel* An Interrupted Friendship

By the Author of "The Gadfly," etc. *Cloth,* $1.50

William Vaughn Moody's The Faith Healer. A Play

By the Author of "The Great Divide."

Cloth, $1.25 *net; postpaid,* $1.35

George Edward Woodberry's The Inspiration of Poetry

By the author of "The North Shore Watch," etc.

$1.25 *net; postpaid,* $1.34

Manual of Gardening

By L. H. BAILEY, of Cornell University.

Ready very soon

How to Keep Hens for Profit

By C. S. VALENTINE, a well-known authority.

Ready in April

How to Keep Bees for Profit

By Dr. D. E. LYON, the bee expert and enthusiast.

Ready in April

Practical Farming

By Dr. JOHN McLENNAN. *Ready shortly*

The farmer will no longer drift on in old ways. The man with even the smallest "back-yard" is waking up to its possible relation to "the cost of living." And these books aim to put at their service the wisdom of men who make a business of securing the highest results with the least effort and expense.

Analytical Chemistry

An authorized translation of Chesneau's *Theoretical Principles of the Methods of Analytical Chemistry,* by M. O. T. LINCOLN and D. H. CARNAHAN.

Published by THE MACMILLAN COMPANY 64-66 Fifth Ave. N. Y.

The Nation.

NEW YORK, THURSDAY, MARCH 10, 1910.

The Week.

The Aldrich bill for a commission composed of Congressmen to investigate Government business methods was passed in the Senate after the rejection of a substitute bill, offered by Senator Newlands, providing for experts on the commission. This exemplifies the jealousy which leads the legislative branch of the Federal Government to undervalue skilled assistance. Misconception as to the function and usefulness of expert commissions led to the crippling of the Committee on Department Methods, better known as the Keep Committee. The Keep Committee gathered a host of facts which the Aldrich bill would apparently undertake to gather anew. True, its scope was confined to Government work in Washington, but it made eighteen reports covering the most important phases of department business. Though the members of the committee were trained departmental administrators, they called in business experts. Comparative studies of private business methods were made, and the recommendations submitted to the President would, if carried fully into effect, have greatly increased efficiency and economy in Government business. We favor any competent investigation which shall better the conduct of Government business, whether it saves $100,000,000 or a less sum. Yet we believe that so vast and complex a business problem as this would be solved best by experts who are not already overburdened with public affairs.

By a vote of 50 to 22, and, except for one Democratic Senator, on a strict party vote, the amended Postal Savings Bank bill passed the Senate on Saturday. It now goes to the House of Representatives. Of the criticisms passed upon it in the Senate, the two most weighty touched the use or non-use of government bonds as a field for investment of the postal savings, and the provisions for withdrawal. Regarding the first of these, Senator Root argued strongly that the law would be unconstitutional unless the receipt of savings, through the post offices, were made an incidental function of the Government's borrowing powers. His argument was combated by Senator Dolliver, who answered that the scope even of the present post-office system, comprising as it necessarily does functions and powers which could not have been foreseen from the primitive post office of 1789, shows the futility of attempting to limit the proposed extension of those functions by the supposed conceptions of the Constitution-makers. The result was a curious compromise. Senator Smoot's amendment provided that "when, in the judgment of the President, war or any other exigency involving the credit of the Government so requires, the board of trustees may withdraw all or any part of said funds and invest the same in bonds or other securities of the United States." This was adopted, after an amendment of Senator Cummins limiting such discretionary use of the funds to time of war had been rejected, and after Senator Borah's amendment, forbidding their investment in bonds bearing less than 2¼ per cent. annual interest, had been accepted.

This compromise seems to us to be open to serious criticism. We find it difficult to approve a plan which deliberately creates so great uncertainty regarding the disposition of what may hereafter be an enormous sum of money. "Any other exigency involving the credit of the government" is pretty comprehensive language. Decline of outstanding government bonds below par might easily be construed as such an exigency; and it is to be observed that what the Administration is empowered to prescribe, in the undefined exigency, is not the investment of future postal savings in an old or new bond issue, but peremptory withdrawal for that purpose of postal savings accounts already deposited in banks throughout the country. We can at least conceive of seriously disturbing consequences of such action, and the placing of it purely in the discretion of the President seems to us a questionable recourse.

Illinois claims the proud record of having had more primary laws declared unconstitutional by the courts than any other State in the Union. For the fourth time within five years a primary law was passed at an extraordinary session of the Legislature which adjourned last week, and now that act rests under a cloud. The Attorney-General is virtually convinced that the law is unconstitutional. It is an amazing reflection on the standard of legislative ability in Illinois that, after three failures, it should be found impossible to frame a primary bill that will meet the specific objections laid down by the courts. Either it is arrant stupidity on the part of the Springfield lawmakers or else arrant dishonesty. Driven by public sentiment into taking up the question of direct nominations, the Legislature has succeeded in foisting on the people of the State one measure after another that will not bear the test of constitutionality. No other explanation suggests itself; against the principle of direct nominations the courts have not pronounced, so that there can be no question of a preliminary amendment of the State Constitution.

The situation in Philadelphia has nowhere been summed up with more force and insight than in the columns of the Cleveland *Leader*, a dyed-in-the-wool Republican organ. The *Leader* refuses to regard the struggle in Philadelphia as a great war between capital and labor:

> For the last quarter-century and longer Philadelphia has endured the tyranny of a monstrously corrupt and shameless municipal machine. Its aim has not been Republicanism, but graft and misrule. It has buttressed its position by fraud, and made lawlessness its weapon. And the great city which has an immortal history and many noble traits has endured all this pollution, inert, unwilling to make the effort needed to cleanse its municipal government. Under such circumstances, it has been inevitable that corruption should befoul the public service corporations and poison their relations with the city government.

The *Leader* might have gone on to show that in the long run the traction companies are as much the victims of their alliances with the political gang as the public at large and the employees. In the end politics reduces a public-service corporation to the level to which the Third Avenue Railroad in New York has been brought. In the end, the transit companies cannot even depend upon their political allies for that amount of

protection for life and property which is their honest due. It is bad politics to club rioters who have a vote. The gang sells capital and labor indiscriminately, works for its own pocket all the time, and carries pollution to everything it touches.

"There are two little inconveniences," wrote Madame de Sévigné of a certain dignitary of Paris, "which make it difficult for any one to undertake his funeral oration—his life and his death." In the case of the late Thomas C. Platt, however, there is now no occasion for touching upon the personal side of the man. That long since passed into the shadow. His rise was coincident with the rise of political corruption by great corporations. He was shrewd enough and callous enough to create himself the paymaster of the forces through the subsidies which the managers of insurance companies and other large business concerns placed in his hands, and then put into operation the rule: "He who pays the bills controls the votes." Thus he made himself the fit instrument of a subterranean and slimy method of debauching Legislatures, and piled humiliation upon the State by forcing the Legislature which he owned to choose him United States Senator. It was as purely a mercenary transaction as was ever consummated. His public example, all these years, has been fearfully demoralizing. What a spectacle it has been to young men entering political life—this domination for so long of the Empire State by a man whom decent citizens abhorred, yet of whom they could not get rid! But the wholesome change came while he was still alive. He died politically long before he died physically, and of his political death it can be said that it was like a dirty lamp going out with a foul smell. With the coming in of better practices, we are entitled to look back upon the political life and activity of Thomas C. Platt as something still to shudder at, but with a sense of relief at having forever escaped from it.

There is some reason to fear that Congress may make a most discreditable exhibition of itself in respect to the honors due to Peary. The Committee on Naval Affairs desires to have the record of Peary's journey submitted to them before acting. This is a reasonable demand, in spite of the fact that the genuineness of his discovery has at no time been questioned in any respectable quarter, and of the fact that the great geographical societies of Europe have been unanimous in bestowing upon him their highest honors for the achievement; but to insist further that the records should be made public would be senseless Peary has no objection to handing the records over to the committee, and doubtless would be equally satisfied to permit their examination by any competent experts the committee might name; but he does object to an anticipation of the publication of his own book. The threat made by Macon of Arkansas that unless the records are made public he will "expose the whole business on the floor of the House or in a statement to the press" should have no influence with the committee. It will be less disgraceful for Congress to have one Arkansas Representative exhibit himself as a blatherskite than for Congress itself to display a combination of ungraciousness and stupidity of which the whole country would have reason to be ashamed.

It is not necessary to subscribe to the Constitutional doctrines set forth in Mr. John Bigelow's letter to the New York *Times* on the Rockefeller Foundation in order to find in it reason for stopping to think about some aspects of the great gift. The main thing is the danger, to which the letter calls attention, in the habit of overlooking the remote and indirect consequences of any new element injected into the social or political organization, its immediate and obvious results being the only thing that we are willing to take the trouble to think about. Any amount of discussion might end with leaving public sentiment just about where it was found. And yet a new development of such magnitude as this, and with such incalculable possibilities for its future, should be canvassed from more points of view than the single one that it is intended for the good of mankind, and that, wisely used, it will yield vast beneficent results.

Instead of speaking in generalities, the kind of thing we have in mind may be indicated by an example. The Carnegie Foundation for the Advancement of Teaching, though formed for the single purpose of making such provision for pensions to professors as might seem wise and desirable, already exerts a marked influence on the policy of many of our colleges and universities, and may in the future exert more. That influence has, we believe, been almost wholly beneficial; but there are many thoughtful persons who regard with real misgiving the possible effect in the future of the kind of domination which the existence of such a revisory institution, with its power of the purse, may exercise over the country's educational methods and ideals. Now, the Rockefeller Foundation is to have unlimited scope, besides probably commanding money resources many times greater than those of the Carnegie Foundation; it is also quite unlike the Carnegie Institution, which is devoted solely to the promotion of research. We do not deny that this very elasticity may be its greatest recommendation. But are there not dangers also?

The latest Johns Hopkins University circular contains, under the head "Recent Publications in Physics," a list of papers and books in that department of science published in the past four years by present and former members of the university. The list of titles covers twenty-two closely printed pages, the number of the authors of these contributions to science being about 110. We should be the last to recommend that an institution be judged by the amount of printed matter it turns out, whether in science or in any other field; but such a list as this might well serve as a timely reminder of the unique part that has been played by the Johns Hopkins University. A timely reminder, we say, because the university is about to undertake the collection of a million dollars—one-fourth having been promised by the General Education Board, conditionally on the other three-fourths being raised—a large part of which it hopes to obtain outside of Baltimore and Maryland. There ought to be a generous response throughout the country. The impulse to the prosecution of higher university work which was given at Baltimore has affected every university in the land; and Johns Hopkins, with comparatively small resources, has continued to represent, more distinctly than any other university, the objects for which it stood at the beginning. Baltimore people have helped the uni-

versity liberally, more than making up the great and unexpected losses on the original endowment; and it would be becoming in broad-minded men in other States to come gladly to the support of such an institution.

In order to hold the office of Ambassador it is well-nigh essential nowadays that a man should have a private fortune, and a large fortune at that. The post has become one for rich men only, and it is often made an opportunity for display which is neither American nor dignified. We are glad to note, therefore, the activity of the American Embassy Association, whose object is to urge the acquisition by the Government of suitable houses for its Ambassadors in foreign capitals. The Association believes that if each Ambassador is required to live in the same house as his predecessor, the vast difference in their mode of life will, in great measure, disappear. At present, a palace houses one Ambassador—as, for instance, Dorchester House in London—while his successor may be forced to occupy a modest residence and be exposed to disagreeable comment on his failure to maintain the pace set him. The Embassy Association points out that we spend annually five hundred million dollars for past, present, and future wars, and it asks the suggestive question, why should we not spend five hundred thousand dollars, as is proposed by a bill pending in Congress, to foster peace by adding to the dignity and influence of our foreign Ambassadors? Why not, indeed!

The results of last Saturday's elections to the London County Council will come as an unpleasant surprise to those politicians who have lately fallen into the habit of picturing the Liberal party as on the verge of ruin and dissolution. Three years ago the Municipal Reformers in London, whose national affiliations are with the Unionist party, succeeded in capturing the County Council from the Progressives who had been entrenched in power for nearly twenty years. It was a clean sweep for the Conservatives, and the election was interpreted as indicating the city's and the country's disgust with the somewhat socialistic policies of the Progressives. Last Saturday the Progressives succeeded in wresting twenty seats from their opponents and just missing thus a majority in the Council. The extent to which the local contest may be taken as giving a line on the present party situation the country over will be disputed, of course. But one thing is plain, that the Liberal party, in case of another general election, is by no means so certain of going down to defeat as its torn-up condition in Parliament would seem to indicate. And still more plain is the lesson that the great cities of England, taken as a whole, are emphatically against tariff reform. This was brought out in the general election, in which London sorely disappointed the fond hopes of the Unionists. Had London experienced a change of heart since last January, here was its opportunity to speak out. Instead, it made it quite plain that its views of two months ago are its views to-day, and a little more so, as one of Mr. Redmond's followers might say.

The fight for suffrage-reform in Prussia goes on by means of argument as well as public demonstrations, and the antagonists of the plans of the present Chancellor are drawing many a weapon from the arsenal of his great predecessor, Bismarck. It is not contended that the latter held any very high or abstract views of the right to the ballot. He denounced, indeed, the Prussian system of voting as the most senseless (*widersinnig*) in the whole world, but this was because it worked badly. In a similar spirit he assented to universal suffrage in the election of the Reichstag on purely practical grounds. It was, to him, only a necessary step in bringing about German unity. And the point made against Bethmann-Hollweg is that if Bismarck were in his place to-day he would surely yield to the common-sense need of making the electoral system more acceptable to the masses of the Prussian people than is contemplated in the very limited reforms proposed by the Government. The contrast is, as the *Berliner Tageblatt* puts it, between Bismarck as the pioneer of German unity and Bethmann-Hollweg as the champion of Prussian narrowness.

Leopold II is dead, but the unsavory history of the Congo, and of the fortune which the late King acquired in that unhappy country, lives after him. In the Belgian Chamber the Socialist leader, Vandervelde, has forced the Ministers to admit that between twenty-five and thirty million francs in Congo bonds which should have accrued to the nation with the cession of that colony remained in the possession of the late King. The overhauling of the Leopoldian régime is bound to occupy the attention of the Belgian Parliament for a long time to come. It will probably be years before all remnants of the iniquitous system have been swept away and a civilized administration is established in the Congo. In the long campaign for the saving of that colony, no party in Belgium has done so much as the Socialist party. The Liberals have been too often divided in council or too timorous. The party led by M. Vandervelde has waged a ceaseless warfare against the policy of extortion and ruin in the Congo. Whatever may be the errors or the dangers of European Socialism, such service as the Socialists of Belgium have rendered to the cause of liberty and humanity calls for the heartiest commendation.

The Nicaraguan revolution has collapsed in the most thoroughly dramatic fashion. President Madriz has played to perfection the difficult game of luring an enemy on to his undoing, and after a long series of insurgent victories it took but one smashing blow to settle the war in favor of the government at Managua. Bluefields is still in the hands of the Estrada faction, and the same campaigning difficulties which made their advance on the capital so difficult and fatal an enterprise will probably keep the government forces from Bluefields for some time to come. But of the ultimate outcome of the struggle there can now be very little doubt. What Señor Zelaya's feelings are at this precise moment, and what Secretary Knox's feelings are, can readily be guessed. The pity of the whole affair is that the lives of thousands of men should have been sacrificed in a gamble initiated by interested politicians, backed by interested foreign capital, and having its only real chance of success in the intervention and coöperation of the American Government. That our State Department did not play into the hands of the revolutionists is less due to our own wisdom than to the gross blunder committed by the insurgents in forcing out Zelaya and putting in his place a man less open to attack.

THE USE OF "INSURGENTS."

In nearly all the reviews of Mr. Taft's first year in the Presidency, mention is made of the rise in Congress of a group of Republican "insurgents." This is spoken of as an embarrassment for the President, and by some as a blow at government by party and even as a misfortune for the country. So long is it since free and independent criticism within the party has been seen, to say nothing of men who follow their consciences in actually voting against party measures, that the notion has crept in that such political manifestations are well-nigh a national calamity. On the contrary, we contend, they are a hopeful sign of the times. They may be temporarily disturbing to the Administration—though even it may profit by them in the long run—but for our general public life they mean a revival of freedom in debate and in voting which may be of the highest usefulness. The point was well put by Senator Dolliver in a public address when he said that the "insurgents" had at least accomplished this, that no tariff bill with glaring iniquities in it could be passed by unanimous vote of the Republican party.

That demonstration was given last August, but since then the importance of having men in Congress who think for themselves and will not surrender their convictions at the crack of the party whip has been shown again and again. Various bills now pending enactment will benefit from the scrutiny and sifting applied to them by men of unfettered judgment. One good example is the bill to amend the Interstate-Commerce Act, on which last week Senator Cummins of Iowa and Senator Clapp of Minnesota submitted a minority report. These men are numbered among the insurgents, yet the views which they submit are of great weight and pertinence. We cannot here go into the mattter at length, but will merely say that these dissenting Republican Senators single out several objectionable features in the proposed amendments. They argue, for instance, that there is grave danger in departing from the existing method of defending suits brought by common carriers to enjoin or set aside the orders of the Interstate Commerce Commission; and that there are serious defects and hidden perils in the provisions respecting "pooling" of railway rates as also in those designed to correct the abuses of over-capitalization. We do not say that all these points are well taken, but we do affirm that it is of great value to have them presented and argued by independent Republicans. If the objections were raised merely by Democrats, the cry would be that they were only partisan. But when Republicans who are both answerable to their constituents and supported by them come forward to criticise Administration measures, their act cannot be lightly dismissed. They are bound to get a hearing, and it is well for all concerned that they should.

The fact is that the Senate to-day is in a position to do better debating and really to make more improvements in legislation as it is hammered out on the anvil, than at any time for thirty years or more. We have to go back to the time when Sumner and Fessenden and Trumbull were ready to take an independent and critical stand to find anything like a parallel to present conditions. The tyranny of party has for years rested heavily upon Congress. Senators or Representatives might have strong convictions about the folly of legislation bearing the party seal, they might warn against it in committee or caucus, but, once the majority had decided, it was not permitted them to speak out their true belief on the floor, much less to vote in accordance with it when the roll-call came. That deadening grip of party has been broken during the past year, and the promise is that it will remain so for some time to come. The Senators and Representatives who have bought their liberty at so great a price are not likely to give it up on the first demand. President Taft and the party managers will have to make up their minds to get on as best they may with a body of Republicans who do not propose to surrender the right of private judgment.

Government by party always goes in danger of its life unless it remains reasonable. When it becomes an unendurable despotism, it is subject to revolution like any other. And the fact is undeniable that, as things have gone in this country for some years past, party control has become too rigid. Independent-minded men have been too much oversloughed or else eliminated. The system of government by party has tended to become what Lord Rosebery calls one of "alternating tyranny"—first by one party, then the other. Party has come to be thought of as a place where men pooled their consciences; but under such circumstances consciences have a way of disappearing altogether. And as a reaction and revolt against any such crushing out of independent opinion and solemn conviction, the appearance of Republican "insurgents" at Washington is not at all a thing at which to be dismayed.

PRICES AND ECONOMIC PRINCIPLES.

Not long ago we had occasion to comment on an article in the series that the *Independent* is publishing upon "The Cost of Living," which discussed the rise of prices in a manner calculated only to increase the confusion. Of the article in last week's issue precisely the opposite can be said. Professor Giddings strikes the note which, at the present moment, much needs to be sounded. The difficulty with most of the talkers and writers on the subject is that they look out, some with wide-eyed wonder, some with a naïve indiscriminateness which they mistake for scientific impartiality, upon a wilderness of facts, the command of which they do not attempt to secure by reference to any central or dominating principles. Professor Giddings calls his article "An Old-Fashioned Theory of Prices." This he puts in the form of a challenge of the central doctrines of political economy by "an up-to-date American philosopher," with the answers to that challenge which he imagines to be given by the three great builders of the "classical" political economy, Malthus, Ricardo, and John Stuart Mill. To condense Professor Giddings's article would be to spoil a fine piece of humor and satire; suffice it to say that it is as spirited a vindication as we have seen in a long time of the importance, too often forgotten by over-cultivated economists in our time, of those cardinal forces which, in our day as a hundred years ago, are the chief causes of economic phenomena. The recognition of the paramount influence of these causes was the great achievement of the masters of the English "classical" school; nowadays we are too prone to forget the distinction between what is fundamental, pervasive, and controlling and what is accidental, sporadic, and subordinate.

In this question of the increased prices of to-day, there are a few central matters of fact, as well as a few central ideas concerning causation, which must be assigned to their right place if we are to have any chance of thinking straight about the problem. Of the matters of fact, the first relates to the degree in which the increase has taken place. This is, of itself, a difficult problem; but there are some points about it which must be constantly kept in mind. One is that the rise of prices has been world-wide, another is that not all classes of commodities have been affected alike, and a third that the point from which prices have risen—if we start with 1896 or thereabouts, as is usually done—was not a normal price-level, but an abnormally low price-level. The rise in the index-number of *Bradstreet's*, which assumes the startling magnitude of 62 per cent. if comparison is made with the bottom figure of 1896, shrinks to the moderate amount of 13½ per cent. if 1892 is made the starting point. To determine what is a fair measure of the present advance of general prices—not to speak of the prices of particular articles—over what may in any sense be called a normal level is an extremely complicated problem; but it is something to remember that before the great rise there had been an equally remarkable fall. Any thought on the subject that overlooks this is worthless; and it is strange enough that anybody should overlook it, when it is only a dozen years since the air was as full of bewailings over low prices as it now is of complaints of high prices.

A second thing that should be constantly borne in mind is that price is a relation between other things and money, and fundamentally (since the demonetization of silver) a relation between other things and gold. Without entering into any discussion of the quantity theory of money, it is evident that prices—*i. e.*, the amount of gold it is necessary to pay for things—cannot be independent of the amount of gold available in the world; there is no more reason that an ounce of gold should always have the same purchasing power, no matter how much gold there may be in the market, than that a bale of cotton should always have the same general purchasing power, no matter how much cotton there may be in the market. And the amount of gold in the world has, as a matter of fact, been increasing at a tremendous and utterly unprecedented rate for about twelve years. That this is the central fact in the situation, virtually all economists are agreed; and, owing to the freedom with which gold flows from one country to another, this circumstance affects prices throughout the civilized world. When the progressive demonetization of silver in the leading countries of the world had been contracting the metallic basis of the circulating medium, and was not offset by a great gold production, this cause was almost universally recognized as being at the bottom of the low-price situation; and in like manner, the world-wide rise of prices we are witnessing now is ascribed by economists primarily to the great augmentation of the world's stock of gold.

The fact that the rise of prices has not been uniform, that it has affected some classes of commodities much more than others, does not at all militate against the foregoing. Whether the general level of prices rises or falls or remains stationary, it will be equally true that the prices of some things will vary in comparison with the prices of others. But if there is any grand department in which prices have risen decidedly more than in other departments, it should be the task of the economist to discover, if possible, some broad and general explanation of this phenomenon. That such a special rise has taken place in the case of food products seems certain. In all probability the explanation is to be found chiefly in the increased demand on the resources of the earth which has come with the increase both of population and of general well-being; and we must add to this general cause, the particular fact of the drift of the population from the country into the cities. This state of things, if carried far enough, must mean that in order to keep people on the soil, it is necessary to give them larger returns than in the past. The operation of this factor may be quite as important just now as that of the law of diminishing returns; the two together are probably sufficient to account for the main facts of agricultural prices.

All this is not meant to show that no intricate investigation of the question of prices is necessary; on the contrary, we have always urged the importance of an investigation looking into the influence of tariffs, trusts, retail combinations, etc., and that by the most highly-trained experts obtainable. But in the meantime, it is worth while to clear our minds of misty notions, and to see as distinctly as possible the leading features of the case. Thus we may both avoid exaggerated notions of the phenomenon itself and reject attempts to explain it by foolish or fantastic reasons.

THE ROCKEFELLER FOUNDATION.

America's reputation for dazzling the imagination of the world by great achievements in philanthropy will be heightened by the plans of Mr. Rockefeller, as announced last week. The bill which was introduced in Congress to incorporate the Rockefeller Foundation looks to the most far-reaching and broadly conceived charitable and educational trust yet established in the United States. The Peabody Fund was a wonderful thing in its day, and its beneficent fruits have been reaped all these years. So, too, the Carnegie Institution, the Carnegie Foundation, and the Sage Foundation have made a deep impress, by the generosity of their endowment and the scope of their aims; and Mr. Rockefeller's own rich endowment of the General Education Board overtopped any other. But, if the large project which Mr. Rockefeller has in mind is rightly understood, it will surpass everything of the kind that has gone before. No figures of the endowment proposed are as yet given, but when we are told that this is to be Mr. Rockefeller's greatest and crowning benefaction, and when we remember that he has already given $150,000,000 to education and charities and medical research, we may expect him to set aside a sum for his Foundation which will be without a parallel in the annals of philanthropy.

The terms, too, in which the objects of the Foundation are set forth speak of sagacity and large-mindedness. There is no tying down of the trustees to narrow limitations. The purpose of the endowment being to run on for many years and perhaps generations, the founder has seen to it that no restricting "dead hand" shall be laid upon those who will have the administering of the unexampled trust. The trustees will have large discretion. Their duties are broadly defined, and the objects of the incorporation are described in such general

words that the working out of the endowment can be made as flexible and helpful as future needs may demand. The great gift is to be for the "acquisition and dissemination of knowledge, the prevention and relief of suffering, and the promotion of any and all of the elements of human progress." That is as broad as humanity itself.

It is explained by those in Mr. Rockefeller's confidence that he means to make of this new Foundation a sort of clearing-house for all his future philanthropies. It will be an investigating and coördinating central agency. Any given end being urged, the means to compass it will be carefully studied. If an existing establishment can best do the work desired, funds will be put at its disposal to enable it to do so. Where either an individual or an institution needs help in some fruitful labor of research, the Rockefeller Foundation will stand ready to inquire and aid. It will publish books of useful knowledge, provide technical apparatus, employ or assist teachers and lecturers. In a word, it is to be a scientifically organized charity on a colossal scale. All of that talent for making large combinations and for creating an instrument of centralized control which went to the accumulating of Mr. Rockefeller's vast fortune, seems now to have been applied to devising this magnificent scheme for giving away a large part of it. The result will inevitably be to carry Mr. Rockefeller's name around the world and down the future as the greatest organizer and most princely endower of charity that had lived up to his time.

There is, however, a pathetic, almost a tragic, side to the Rockefeller Foundation. It is the human, the personal aspect. Mr. Rockefeller bestows hundreds of millions upon a people who do not love him. The great outburst of acclaim which would ordinarily follow such a public beneficence will not be his. He is an unpopular man, and, so far as can be seen, nothing that he can now do will ever lead his fellow-countrymen to shower upon him praise and approval. Into the causes of this it is not necessary to enter. So far as public reasons go, Mr. Rockefeller's identification for so many years with a company which came to touch the life of nearly everybody in the country, and which was believed to have long practised oppression and extortion, is enough to account for the associations that have been fastened upon his name. But there are personal reasons as well. To see what we mean, one has only to compare Mr. Rockefeller with Mr. Carnegie. Each set about giving away a tremendous fortune in his life-time, but with what different results! The difficult art of being very popular while very rich seems to have been perfectly mastered by Mr. Carnegie, but missed almost completely by Mr. Rockefeller. The former is easy and jolly in his manners, with an air of good-fellowship about him, taking a kind of boyish and even boisterous delight in his philanthropies, and making himself with his smile and his *bonhomie* a welcome figure everywhere. But all of that is quite beyond Mr. Rockefeller's range. By contrast, he appears awkward and hermit-like and melancholy. The very care which he gives to his charitable work, scrutinizing all applications closely, and elaborating plans like a conscientious business man instead of a jovial flinger-about of his money, while in itself a most praiseworthy thing, has undoubtedly the effect of detracting from an appearance of abandon and exuberance in his philanthropies. All this is in a true sense pitiful, yet it is inevitable. To the end of his days, so far as men can see, Mr. Rockefeller will continue to be thought of personally by the mass of his countrymen very much as he has been for thirty years. This is surely the tragic stuff of which human life is made. Possibly a hundred years from now some historical scholar under the Rockefeller Foundation will be set to studying the political and social conditions in the United States from 1875 to 1910, and will find to his amazement that the name of his benevolent founder had in his life-time been held in execration by millions!

PROFESSIONAL READERS.

In resigning his position as literary adviser of the New Theatre, Mr. John Corbin has spoken the thought of many an overburdened professional reader. He is tired of the job. During his incumbency he has read, inwardly digested, and at times thoroughly criticised something like two thousand plays—about five a day, by our reckoning. Out of these the New Theatre has put one or two on the boards. Mr. Corbin is too considerate to say that under these conditions the game of literary adviser-ship is hardly worth the candle, but he evidently is eager to turn his energies to almost any other occupation.

His plight merely brings into picturesque relief that of a class. Hundreds of skilled readers pass upon the mass of manuscript submitted to publishers and magazine editors, and the fate of such matters is usually settled long before they reach the august person whom the hopeful author thinks to impress. Year in year out, these tasters of literature appraise the motley flux, skimming off for publication the smallest portion, diverting the rest toward other readers and final oblivion. An extraordinary alertness is required of them. The early pages of a manuscript by an unknown and evidently uncultured writer may bristle with solecisms. Its illiteracy must be provisionally disregarded, for it may be an egregious best-seller—some "When Knighthood Was in Flower." A still finer discrimination perceives the promise in some half-achieved thing—the sketch for a "David Harum." Or, again, some book charged with innuendo is submitted. Will the public stand it, run after it? Can the reputation of the house bear its publication? The professional reader is supposed to know by some magic what will sell. The manufacturers of Yankee notions and the travelling agents of the antiquaries often have this instinct fully developed. It seems not a rational ascertainment, but a purely temperamental sense of what people will like.

Such is the first and foremost duty of a professional reader. If it seem a simple one, it should be recalled that a report is also required on literary quality. Self-respecting publishers are expected to make certain concessions to that unpopular commodity which among themselves they style admiringly "real literature." Here, too, the reader's task is complicated. If real literature is to be published at a loss, evidently that which involves the greatest gain in prestige and the smallest deficit in dollars is to be preferred. The head of the mere author or layman swims at such a problem; the professional reader must solve it regularly or lose his or her place. It is with the reading corps, even more than with the principals, that resides that intangible yet very real entity, the tradition of a publishing house. As one star differeth from another in glory, so

there are degrees of dignity in readerdom. Professors and detached experts are called in to pass upon manuscripts within their field. But these are like prosperous citizens who incidentally enjoy the honors and collect the fees of the magistracy. With them may be ranked those rare readers whose commission is a roving one. We know of one enterprising publisher who pays a well-known man of letters a substantial honorarium for reading the magazines and reporting on new writers of promise. These are the refinements of the profession. The notion, however, of commuting for a cash consideration the duty of reading the magazines personally is worth the consideration of all well-to-do persons of limited leisure.

There have been, we believe, confessions of publishers' readers, but we recall nothing that goes to the heart of the matter and explains what sustains sensitive persons for years in so dire a task. For them surely the glamour of the written and printed work is soon dulled. A certain curiosity about literary processes must generally be found in them. Their work is, after all, barring a stricter revision of results, not unlike that of the critic or book reviewer. Much of the critical faculty, with its underlying inquisitiveness, they must possess to succeed. But we imagine that the actual sustaining principle is a kind of sporting interest in a venture that abounds in uncertainties. About most of the matter submitted there must be a hideous monotony, but there is always the off-chance of a "Mr. Barnes of New York" turning up in the mail.

Men of letters have taken a malicious pleasure in slating the professional reader for his or her manifold stupidities. "John Halifax, Gentleman" was well buffeted about; so, for better reason, was inchoate "David Harum." But, on the whole, the mistakes have been singularly few. Undoubtedly much pretty talent has failed to receive a publisher's subsidy, but there is no reason to suppose that any considerable number of important works of literature have been shown the door. If seasoned writers, including the unappreciated talents, would ask themselves what has been the best and shrewdest criticism they have received, the answer would often be: "That of the publishers' readers." In fact, the common skepticism as to the authority of criticism might perhaps best be met by showing in how orderly and successful a manner a working consensus is arrived at on a standard implying now intrinsic merit, now commercial expediency.

SERIOUS HUMOR.

Artemus Ward said that a comic paper was no worse for having a joke in it now and then, and his words have ever since been quoted as embodying the gospel of wit and humor. The great form of American mirth is the joke. "It is to laugh"—that's our creed in a sentence. Misplaced capitals, awkward spelling, impossible grammar, infinite incongruity of situation, endless word-play, grotesquery of action and character, heightened by pictures equally funny, these are the things that make us laugh. We are quick to catch the point of a cartoon, to enjoy the exaggeration of a caricature. But to smile at the mock-serious, to be amused by satire, is a refinement as yet beyond us.

But our condition in this respect is not hopeless. When political freebooters solemnly plead with misguided reformers, newspapers, ministers, and college professors not to injure the fair fame of their common dwelling-place by pointing to its shames; when experience-hardened experts in statecraft with uncontrollable moral indignation denounce attacks upon one of their number, in the thrilling period, "It isn't right!"—when such things as these can be, it is impossible to deny the existence of American humor, however unconscious. He would be a rash reasoner, nevertheless, who concluded that self-revelation was the key to the storehouse of humor. While there would undoubtedly be those whose unconsciousness of humor was merely apparent, the great mass of the really unconscious would only be rendered fatally shy. Self-revelation would but kill the precious goose. The clue, however, does lie in this lack of perception. What is needed is the awakening of those who are not humorous, even unconsciously, to the presence of this quality all about them.

The obstacle in the way of the creation of a national sense of humor is the stubborn fact that humor is fundamentally serious. We have an ingrained notion that some things, as business, society, and sport, are serious, while others, as books, Sunday supplements, and theatres, have no excuse for existence except as they furnish fun. To suggest to your casual neighbor in the train that there is such a thing as serious humor would be to invite an incredulous stare; to insist that there is no other kind would be to incur the risk of unpleasant suspicion of your mental equilibrium. You might get your companion to admit that in Greece or in some group of dryasdust intellectualists your queer idea could possibly find assent, but never with him. And he would be only too nearly correct. A serious argument for the recognition of humor as a not unimportant element of civilization, even of morality, would be regarded as only a heavy way of trying to be amusing, far less entertaining than a real joke. But this is only part of the difficulty. Convince your supposititious acquaintance of the validity of your contention that humor is serious. You would merely have brought yourself to face the conclusive inquiry, why be serious? Isn't life serious enough? In that question lie the threads to a thousand ways of thought and character in American life. Making a living is serious business. All else—literature, drama, music—is recreation. If art cannot entertain, it is stupid.

Never was there a richer field for a great humorist than this. Our solemn devotion to the primal necessities, our patronage of the past, our contented unconsciousness of shallowness, our toying with the fringe of culture, our desperate efforts to persuade our public servants to do some part of what we elected them to do, our joyful surprise when they do it, our method of punishing them when they don't do it, our inconsistent but no less eager manifestations of satisfaction when a generally chosen Executive endeavors to force his will upon our specifically chosen representatives, our strange mingling of ideality and practicality, with its suspicion of professions of unselfishness, its worship of success, and it glorification of moral courage—but why extend the list? The great American novelist may be an absurd conception, but a great American humorist is a positive need. Nor should we fear lest his revelations might convert us to seriousness or to consistency. There would be no danger of our doing anything that would threaten the sources of our exhilaration.

THE FRENCH REVOLUTION

PARIS, February 24.

Augustin Cochin, *archiviste paléographe*, in a book of little above 100 octavo pages ("La Crise de l'Histoire révolutionnaire, Taine et M. Aulard"; Paris, H. Champion, 2.50 francs), marks the present "crisis of the history of the French Revolution." The new Rector of the University of Berlin also took the occasion of his recent inaugural discourse to express confidence, in spite of all attacks, in Taine's historical methods and results. It is nearly forty years since the materialist philosopher began publishing his searching examination, which ended in a formal arraignment of the Revolution in its origins, factors, and events. The burning question is no longer whether Taine, the philosopher historian, approximated to the truth of things; but whether there are two truths in history, one of which is official and to be promulgated in the name of collective humanity, while the other is individual, to be passed over as incidental and even dissembled lest the official truth suffer doubt?

In 1888 the Municipal Council of Paris instituted at the Sorbonne a lecture course on the history of the French Revolution, with a suspected aim in regard to Taine like that of Queen Elizabeth's Oxford College for the perpetual refutation of Bellarmine. Professor Aulard has been the lecturer from the beginning, and his succession of published works has not belied the aim. They came to a head with the publication, two years since, of his arraignment of Taine as an historian. Taine exposes the facts of the Revolution; Aulard explains the Revolution, and at the same time denies Taine's accuracy and explains away his facts.

M. Cochin takes up the case, partly as a documentary expert. In a single chapter out of ten he draws up a sample list of "errors" in Aulard's array of Taine's "inexactitudes." A not too favorable critic (*La Grande Revue*, November 10, 1909) remarks: "M. Aulard's discoveries rendered Taine odious; M. Cochin's discoveries make M. Aulard rather ridiculous." M. Cochin concludes this chapter: "Thus, taken as a whole, the facts and testimonies gathered by Taine remain untouched. What he recounts is true." Gabriel Monod, *clarum et venerabile nomen* in French teaching of history, pronounced fifteen years ago ("Les Maîtres de l'histoire"): "What he has said is true."

M. Aulard and his school have begun none too soon if they are to veer civilized sentiment from reprobation of the Revolution's deeds, which they belittle and excuse and justify, toward acceptance of the Revolution's leaders and dogmas. For M. Cochin, then and in our own time, the essential question goes deeper: "What is this official reign of public opinion, of the free and sovereign people?" He begins from the "historic phenomenon, ill understood and never studied directly and in itself until Tocqueville and Taine." It is always the same: In July, 1789, Camille Desmoulins—and the people: in October, Maillard with his sabre bared—and the people; in the September massacres, 1792, Billaud and Danton—and the people. Of the former we know the least details—of the latter nothing. Yet "the people" do everything, storm the Bastille, lead King and Assembly, massacre prisoners:

> The "patriot" people of 1793 is the same as that of 1789. . . . Taine was first—and it is his glory—to dare look it in the face and demand its right to its title. He was first to try to define and comprehend the Revolutionary phenomenon, to make acquaintance with the "sovereign people," with "patriotic opinion," from 1789 to 1794, during the five years of philosophic liberty. . . . How far has he succeeded?

The summary verdict of Seignobos is known: "Taine's 'Revolution' is the painting of a duel in which one of the adversaries has been effaced, giving the other the look of a madman." Even if true, adds Professor Aulard, it is no matter; for Taine's method in his social statistics of 1789 is like collecting all the horrible cases in our Paris newspapers of to-day, "to give an idea of France in the year 1907." In two lively pages M. Cochin transfers a few of Taine's cases to a *Petit Journal* of our day: 120 fires, murders, robberies; Rouen, Lyons, Strasburg, Marseilles, in the hands of rioters and brigands; the *maire* of Troyes, an aged magistrate, with hay thrust in his mouth, his eyes picked out, tortured for hours and killed; generals at Rennes, Dijon, Bordeaux, Caen, in flight or prisoners or capitulating; the heart of the commander at Belzunce cut out and paraded on a pike; in Paris, the guard in revolt, the unions publishing their lists of proscription, Minister and Chief of Police and civil governors killed and heart and head paraded amid flowers; the Parliament forced daily in open session by a few hundred outsiders calling themselves "the People":

> These are some of the "little facts." . . . Taine thought they deserved a first page. M. Aulard has more principle; he says not a word of them in his "Political History." . . . This is not so much a sentimental taking of sides on his part as a method and a subject, which certainly merited having their historian; it is the interest of history to establish the official version of Jacobinism.

Elsewhere M. Cochin names Professor Aulard "the historian of Republican defence." His method supposes that even the worst incidents of the Terror may be passed over as "circumstances of war." This method is more than ever followed for uncomfortable events of our own time: the Paris Commune is now only an "insurrectional movement," and its massacre of hostages a mere incident provoked by the advance of Thiers's troops; and last summer's Barcelona riots are explained away and justified in like manner. As M. Cochin remarks, "it is never the Revolution which begins." He thereupon inquires: "Is it true, as M. Aulard believes, that circumstances justify all the laws, all the acts of the Revolution?"

From this *thèse des circonstances* our author proceeds to the *thèse du complot:* "For there is a fact as certain as the principle is clear—the distinction, however far back one may go, then the divergence, then the conflict, between the Sovereign People of the Societies and the people, between M. Aulard's Revolutionary France and France simply." Just as Taine's facts upset the defence of the Revolution from outside circumstances, so here they stand in the way of the Royalist explanation of it by plots and intrigues within:

> There appears in 1789 a people which oppresses the majority, a liberty of principle which destroys liberties of action, a "philosophy" which puts to death for opinions, justice which puts to death without judgment. We see this miracle come to pass—the despotism of liberty, the fanaticism of reason. Such is the Revolutionary antinomy. Has Taine solved it, disentangled the origin of such strange ideas? I do not think so. . . . [But] Taine's critical examination permits us, if not to solve, at least to put very clearly the Revolutionary problem. The humanity which slays is sister of the liberty which imprisons, of the fraternity which spies, of the reason which excommunicates—and all together form that strange social phenomenon called Jacobinism.

In successive chapters M. Cochin suggests the application of M. Durkheim's sociological methods to this disputed period of history; he examines the Republican defence; the social opinion of the time and how it was worked up; and the people's mysticism (a much abused word in French theory). M. Aulard's defence is "a passive orthodoxy bringing into history the new political god of the social régime—the People. Do you measure now the full enormity of Taine's crime? He has overthrown the idol, broken in pieces the grand fetish of the Revolution—the People."

M. Cochin's little exercitation in logic applied to history can in no event be rejected without reason. It concludes with a dilemma and a warning:

> Thus the question is still open and the problem unsolved: on one side, an explanation upheld only by dint of omitting and attenuating; on the other, facts all the less explainable the better they are known. . . . Shall we see the end of this crisis? I believe so, but on two conditions: first, that we guard ourselves against the scourge of all curiosity, indignation; . . . secondly, that critical examination shall finally rid us of the Revolutionary fetish, the People.

Thus both Taine and Aulard are old-time historians; our own generation for ten years has seen how the real people is led in France by the "Petit Peuple," and can study this object lesson at first hand by new scientific methods, and it now has to apply the lesson to history as it will be written to-morrow—"the social history of the Revolution." For this will be useful both Taine's sincerity in collecting facts as an example and Aulard's "patriot" version as a document.

An excellent praxis and, in some ways, a corrective of M. Cochin's logic may be found in the studies and documents of Léon Dubreuil, relating to the Revolution in a single department, a part of Lower Brittany ("La Révolution dans le Département des Côtes-du-Nord"; H. Champion, 3.50 francs). It is written without theory and shows how the peasants, when their land-hunger had been satisfied, lost interest in further Revolution; how agitating *bourgeois*, after they had levelled the nobles and had their own elevation to defend, came in their turn to a standstill; and how the few "patriots" fared in trying still to keep pace with Paris. Attention might have been given to facts which show that much of the Breton opposition to the Revolution had a religious motive—a civil clergy not accepted by their church had been foisted on them. In any case, "when, in 1804, it pleased Napoleon to change his title of consul for life to that of Emperor, he found the Republicans of 1793 Imperialists without knowing it."

Edme Champion's "J.-J. Rousseau et la Révolution française" (Paris, A. Colin, 3.50 francs) will, for some minds, be a work of little less importance than that of M. Cochin. It is a direct answer to those who accuse Rousseau of being the forerunner of the Terrorists. In particular, it controverts the brilliant literary work of Jules Lemaître, who serves ostentatiously the counter-Revolution, which Taine did not. "Perhaps the best way to defend Rousseau would be to write at last the history of the counter-Revolution. Guizot, in his youth, expressed in memorable terms a truth which he forgot all too soon: 'By the counter-Revolution the Revolution was poisoned.'" In twenty-two chapters, with much documentary comparison, M. Champion arrives at his interesting conclusion:

With more study than has yet been given to what was said and written on the eve and the morrow of the fall of the monarchy, perhaps Rousseau would cease to pass for a "direct author" of the French Revolution. . . . Instead of striving to establish a bond between certain passages of the "Contrat social" and the events of the Revolution, so as to conclude with M. Faguet that Rousseau would have recognized in Robespierre his minister, his "chancellor," let us question the actors of the drama; let us ask them how they understood Rousseau; let us examine how far they took account of his teachings; without taking sides, let us seek the motives of their acts.

M. Champion defends Rousseau against the accusation of inspiring the deeds of the Revolution; he admits the deeds which Taine recounts, but his work should not be altogether displeasing to M. Aulard, who defends the Revolution itself. Perhaps the deepest question, after all, is that propounded by Tocqueville's English friend, Henry Reeve, in the *Edinburgh Review* for July, 1871: "Why is it, then, that the very name of the Commune of Paris is a name of terror and turbulence, whilst that of the City of London is synonymous with good order and ancient unambitious civic administration?"

Correspondence.

THE CARNEGIE FOUNDATION.

To the Editor of The Nation:

Sir: Some four years ago the generosity of Mr. Andrew Carnegie led to the establishment of the Carnegie Foundation for the Advancement of Teaching. A magnificent endowment, $10,000,000, provided large retiring allowances for professors in our colleges and universities. Later, $5,000,000 was added to extend the privileges of the Foundation to tax-supported institutions. The educational world rightly greeted this announcement with joy and satisfaction; here at last was a man who recognized the work of our college professors and made suitable provision for the old guard. Trustees were named; the machinery of the Foundation was started, and institutions of higher learning made haste to become enrolled in the accepted list.

It seems strange that the development of plans for the carrying out of this generous donation has led the trustees into paths far remote from the starting point. They have adhered to the original purposes of the gift; yet the machinery they have elaborated in some cases does not appear to be working in harmony with Mr. Carnegie's original intention and the best interests of education in this country. We have had other funds given to advance education, notably the Slater Fund, the Peabody Fund, the Southern Educational Fund, and the General Education Fund, and their trustees have done great and noble service, and that, too, without disturbing our general educational conditions or attempting to dominate the institutions they served. Much less have they attempted to control the educational policies of the country.

The Carnegie Foundation was confronted with an array of colleges and universities, large and small, strong and weak, and in the attempt to sift from this lot the "accepted" institutions, a definition was evidently sought for the words "college" and "university." What institutions should be qualified to share in the Foundation? The three principal tests imposed by the Foundation were: (1) the financial test: an institution must possess a certain amount of invested funds; (2) the religious test: the institution must be free from denominational control; (3) the scholastic test: it must have a certain fixed standard in scholarship. Under these conditions a number of colleges and universities became participators in the pension system of the Foundation. According to this plan, many professors have been retired upon allowances, and in many cases the widows of professors have become beneficiaries of this organization. This feature of the work of the Foundation has met with general praise.

But in this attempt to standardize our higher educational establishments, the conditions imposed upon the participating institutions have brought about a singular state of affairs. A great many colleges could not measure up to the educational standard set for them. They were obliged by the Foundation to rest upon a high school course that offered fourteen yearly five-hour-a-week courses in four years; this gave the "fourteen points" for entrance to college. This standard of fourteen points, an arbitrary standard, was not uniform among institutions of the foremost grade, some had higher standards, others lower. In the South and West many colleges are at present debarred from enjoying the privileges of the Foundation. From the correspondence printed in the third report, one may see how the presidents of Southern colleges are affected. Some hope to meet the test, and beg for time; others show small hope of doing this and pray for a modification of the standard. The South, which needs the help more than the North does, is almost shut out. According to the fourth annual report, of a total of sixty-seven participating institutions, there are three approved institutions in the South; in New York, New Jersey, Pennsylvania, and New England, there are thirty-seven. The other Northern States, running as far west as through Nebraska, have twenty-two with two in the Far West, and three in Canada.

In meeting the religious test a number of our well-known institutions appear to have met with difficulties. Most of our colleges, as is well known, were established and have been maintained by denominational connections. To-day many of them retain something of their old character. To compel these institutions to meet the non-denominational control clause appears very much like asking them to ignore their traditions and to forget their history. Yet some of them stood the test, probably with the belief that time had wrought such changes that the modernization of these institutions would appeal favorably to the alumni and the greater public. Others had more difficulty. Bowdoin College (so it runs in the annual report) carried on a correspondence with the Foundation for more than a year and a half; and, in order to purge herself of denominational connections, was at last obliged to have recourse to the courts on one point, to exact a waiver from a sole heir on another, and to hand over to Andover Theological Seminary $56,118.16 on a third, this last being a fund left to establish a professorship of $50,000, on condition that the president and a majority of both college boards should "always be in doctrinal and religious sympathy with the Orthodox Congregational Churches of New England." It is rather a pathetic spectacle—this long correspondence. The Bow-

doin trustee said: "I think I may take it for granted that your Foundation does not wish the college to throw away money. It cannot afford to do this." And yet this is what it actually did. On another page and altogether apart from this matter, President Pritchett of the Carnegie Foundation writes: "A large proportion of those who sit on boards of trustees in colleges have no conception of college work, and have shown little readiness or ability in the handling of even its financial responsibilities."

Other colleges which have had more or less difficulty on this score are Drury College, the Central University of Kentucky, and Drake University. This last-named university was obliged to amend its charter so that not even a minority of its trustees might be elected by a denomination—the Iowa Christian Missionary Convention. The Central University of Kentucky was obliged to compel two Synods of the Presbyterian Church to resign their powers of electing the board of trustees. And Drury College secured in the Circuit Court of Greene County, Missouri, an amendment to its articles of incorporation so as to eliminate from them all reference to any denominational restriction upon the board of trustees. Coe College and Swarthmore College have recently had similar experiences.

It would seem to the observer that there was a fine ethical principle here involved. We have in this country many colleges under denominational leadership. The Presbyterian College Board reports 51; the Congregational Educational Society, 23, and the Methodists and others have large lists. These institutions, and colleges and universities somewhat like them, are playing an honorable part in our history. They have received our prayers and benefactions; and to them we send our sons to receive the elements of manhood. What will these boys say (and they are a pretty keen lot), as they discuss the ethical principle involved in a college renouncing its allegiance? Will they not sometimes recall the story of the young man who sold his birthright? Is the cause of teaching advanced when colleges, our strongholds of higher education, are tempted to forsake the faith that has made them what they are?

Enforcing these regulations, together with a financial test which was not very difficult to meet, the Carnegie Foundation has during the past four years been creating educational history very rapidly. It has established, or threatened to establish, a system of inspection throughout the colleges on the approved list to see that there be no lapse from moral rectitude. It has offered opportunities for unfavorable comparison by stating that certain institutions have been "accepted," while others are "not accepted." It has offered for adoption a uniform system of college and university accounting. It has established an exchange of teachers between this country and Germany. It has become actively allied with the College Entrance Examination Board—an organization that sets examination papers for college entrance. It has publicly criticised two universities, not members of the Foundation, for allowing politics to play an undue part in the choice of professors and other officials. And it has openly driven from its membership and held up for public censure one university which, it asserted, did not live up to the tests of the Foundation.

It may safely be assumed that educational conditions in this country are not what they ought to be. Educational unity may be lacking. College requirements may not be fair or uniform. Politics may enter too largely into some of our educational transactions. Men of leadership may at times feel the need of moral supervision. The question that may be raised here is not concerning the necessity of certain definite reformatory action; it concerns the competency of such a board as the Carnegie Foundation, a close corporation, to render decisions which may be accepted as final and official. Power and authority are good things in their places; but one ought to seek the origin of this power, the basis of this authority. Leaving out of consideration any question of wrongdoing on the part of universities, the question may fairly be put: What authority has the Foundation for uttering a decree that may bless or damn? The United States commissioner of education or any State superintendent of education might issue an order, and it would be official, backed by authority; not so the Carnegie Foundation. But the effect of the Foundation's decree is far-reaching.

There has been much written of late concerning the domination of our high schools by the colleges and universities, and much intelligent effort has been spent to make the high schools more what they ought to be. This question may be raised: What help will come to our system of public education by the superposition of the Carnegie Foundation upon the colleges, and by its insistence upon certain demands which the colleges are to make of our high schools? Put it a little more bluntly: What right has the Carnegie Foundation, a non-political close corporation, to impose restrictions and regulations upon the public schools of the country? And in those States where State universities control educational policies, put this question: What right has a State Legislature to allow its State university, an institution supported for the public by public taxation, to be controlled as to standards or policies by an outside body? This question of the attempted indirect domination of the public schools by the Foundation is one which should receive the most careful attention. The source of power in this country lies in the people, and authority is granted to their chosen agents. Such expert agents of our public educational interests are scattered all over our land; and it is competent for them, and for them alone, to dictate policies which eventually affect our national life.

All this is a far cry from the pensioning system which Mr. Andrew Carnegie, in great generosity, desired to establish; yet this discussion has followed the development of the machinery of the system. The future usefulness of the Foundation apparently lies in carrying out the wishes of the donor, and in avoiding the difficulties which some of the trustees of the Foundation did not at first fully appreciate.

CHANGING STANDARDS.

To the Editor of The Nation:

Sir: Rather interesting to Southerners was your recent editorial on "Losing Our Standards," in reference to what was right or wrong in the civil war.

There are changes going on in this side of the struggle, too. Intelligent self-supporting negroes may be found who heartily agree with Mr. Calhoun that slavery was better than freedom for the race; while, on the other hand, there are some Southern whites who disparage Southern traditions and polity.

It is possible that we ought to lose some of our standards, inasmuch as our judgments were warped by the stirring events of that period. We are still too near the event to make a final verdict in matters of right and wrong; or even in reference to some points of expediency. For instance, when the war closed, the picture of Mr. Lincoln's life was entirely finished, and the monument of Mr. Lincoln in the act of striking the manacles off a slave seemed to sum up the whole story of his career; but subsequent events which grew out of Mr. Lincoln's precedents and presidency have given to that statue an air of incompleteness. The extravagance in pensions and in government, the corruption and irresponsibility engendered in official places, the tariff for revenue and for protection which has built up a more universal form of slavery, the bondage of the many to a capitalism which manipulates the government in its own interest—these and other developments make one lose his "standards" with kaleidoscopic rapidity. Mr. Lincoln, in order to attack an evil, had to go outside of his Constitutional powers, and several generations will yet have to pass before an impartial historian can speak the final verdict on Mr. Lincoln's remedy for slavery, whether or not it was more costly and corrupting to the body politic than the evil itself. Tiberius Gracchus, with the best of motives, began in an unconstitutional way to attack an evil entrenched in power, and his place in the history of Rome could be decided only after a century of conflict had borne its full results

Gen. Sherman passed through our State just before peace was declared. The Confederate soldiers returned to their homes and saw the track and débris of the cyclone. That was the end of it. They set to work to rebuild their homes and their lost fortunes. But by and by, Gen. Weyler in Cuba, later Lord Roberts in South Africa, and our own generals in the Philippines began to study Gen. Sherman's exquisite methods of making "both high and low, rich and poor, feel the hard hand of war, as well as their organized armies."

Then it began to dawn on us that our disasters were not unique, but that from the days of Sargon to the civil war the desire of dominion and empire ran uninterrupted and made the will of the stronger the law for the weaker. With this broader view of the situation it followed naturally that the imprecations upon our Northern invaders were transferred in a measure to fate and the nature of things. And so on and on with the passing years and fast coming events one Southerner at least has been losing his

point of view, and changing his standards in reference to the civil war.

Greenville, S. C., March 1.

THE HERALD IN "HENRY V."

To the Editor of The Nation:

Sir: In his recent article in *Harper's Magazine* for March, entitled "New Shakespeare Discoveries," which has already excited such widespread interest, Prof. C. W. Wallace remarks that Shakespeare "also honors his host [Christopher Mountjoy] by raising him in the play [*i. e.*, "Henry V"] to the dignity of a French herald, under his own name of Montjoy." This statement is substantially repeated in the account of the article in question which you published in your issue of March 3. Whatever influence Shakespeare's residence with his French host may have had on "Henry V"—and I think that Professor Wallace is right in most that he says on the subject—none can be claimed in this particular matter, for "Montjoy" or "Montioie"—we have both spellings—was already the name of the herald in Shakespeare's source for this play, viz.: Holinshed's "Chronicle." This one can easily verify by referring to the corresponding passages of the original text as they have been reprinted on pp. 182 and 194 of "Shakespeare's Holinshed: The Chronicle and the Historical Plays Compared," by W. G. Boswell-Stone (The Shakespeare Library, 1907).

"RARE" OR "OVERDONE."

To the Editor of The Nation:

Sir: Picturesque phrase-making is not new, but never has it been more novel. Not even in the days of Elizabeth was the language so tortured to yield up a new phrase, or, what is often quite as startling, the ghost of an old one. Especially our descriptive writers seem put to it to give us an accurate notion of anything—the old phrases are so dim or so discolored. "Blue" no longer does much for the sky, which must now be an "aching, vivid turquoise" before we can identify it. True, this is a special bit of sky above Mukden, a city in the *Atlantic Monthly*, and no doubt in Manchuria as well, where towers are "colored fiercely vermilion," and streets present "a sudden terrific splashing of gold, and splatter of red, fresh and clean and beautiful as blood," till the beholder is "smitten mute by a crushing sense of color." Nor do the ordinary terms longer mean much to the art critic, if a writer in the Boston *Transcript*, describing the loan collection of Whistler etchings now at the new museum, can be trusted. The Coast Survey plate is "simply reeking with significance," and certain plates are "quite in the tadpole stage." Of course, for the sake of passing humor and the jangling jargon of journalism, these things are adequate. It would be fatuous to carp seriously at such phrases or to quote in righteous contrast a line by Joseph Conrad, who has seen the skies of the East, or a line by Whistler, who has made significant phrases as well as "plates in the tadpole stage." But surely it is evident that language, like many another creature on the rack, shrieks when tortured too far—and later may be expected to die from exhaustion.

Richard Rice.

Bloomington, Ind., February 25.

MEDICINE IN THE MIDDLE AGES.

To the Editor of The Nation:

Sir: In the science department of your issue of February 10 appears a statement which cannot pass unchallenged, namely, that "the mediæval mind knew no science of medicine, and, even if it had known, the dissection of the body would have been held sacrilegious," etc. What is gratuitously asserted is gratuitously denied, therefore I deny the truth of this statement *in toto*.

Is it possible that your critic is ignorant of the history of mediæval medicine? Permit me to refer him to the address of Prof. Clifford Allbutt of Cambridge University, "On the Historical Relations of Medicine and Surgery down to the Sixteenth Century." This was delivered before the Congress of Arts and Sciences held at the St. Louis Exposition in 1904. A reading of this will convince him that his statements are erroneous. Has your writer never heard of William of Saliçet, Lanfranc, or Guy de Chauliac, the "Father of Modern Surgery"? Does he know nothing of the hospitals established by order of the great Pope Innocent III? If the assertion that "disease, death, and poverty were dispensations of Providence, and any attempt to study them at close range with the idea of their prevention would have seemed like questioning the omnipotence of God," etc., be true, why did the Pope undertake to build hospitals? Why were vast and perfectly organized charities maintained to relieve want? In addition to Professor Allbutt's address, a perusal of Dr. Walsh's "The Popes and Science" will convince any man that his own *ipse dixit* will not be considered by thinking men a sufficient proof that the Middle Ages were times of darkness and ignorance.

Charles C. Conroy.

Saint Vincent's College, Los Angeles, Cal., February 18.

"IT IS ME."

To the Editor of The Nation:

Sir: It is, of course, beyond all dispute that the weight of authority is on the side of "It's I," the form preferred by careful writers. All that I set out to show in my hurriedly written letter (*Nation*, February 24) was that there is some authority also for the less favored form; but, as this latter is still questionable usage, no teacher of English would, on the strength of that authority, allow it to pass unchallenged in the written work of his students. So far as my observation goes, teachers of English, from their natural desire for purity of speech, are more inclined to lean too far on the side of purism. Yet, after all, it is difficult to conceive that—outside the circle of confirmed precisians—any one with any feeling for language could prefer "Be thou I, impetuous one!" for instance, to the line as Shelley wrote it.

E. A. Allen.

Columbia, Mo., February 28.

To the Editor of The Nation:

Sir: It is said that some one of Thackeray's friends once asked him, when the locution in my title was under discussion, what he would say if, on going to a friend's door and knocking on it, he got the salutation, "Who is there?"

Thackeray replied, "I should certainly say 'It is me'; but if I were writing of a situation of that sort, I should say 'It is I.'"

And, is not this just about what we should all do? We are not living to make or justify a grammar; but very often find it convenient to put our spoken colloquial sentences, as we do our clothes, in loose and easy forms. A pertinent story is told of a very scholarly editor among us. One morning his servant, Bridget, asked him how he was feeling; and he replied, "Oh, I feel good; how are you?" Whereupon she answered, "I feel very well, thank you." Here the correct usage came from illiterate lips, while the scholarly editor was at once conscious of his own grammatical infelicity. As certain nations—China, for instance—have a common people's language, and a literary one vastly different, why may we not all enjoy, sometimes, when we are in mere dialogue, the common "illiterary" lingo?

Joel Benton.

Poughkeepsie, N. Y., March 2.

ANCIENT GREEK COSMOLOGY—A REQUEST.

To the Editor of The Nation:

Sir: I have noticed with some surprise the singular agreement between the form of the earth as described in the "Sūrya-Siddhānta," and its form as implied, if not fully expressed, in the "Argonautica" of Apollonius, iii. 159-163. In each case the earth has at its poles, and hence antipodally located, two vast mountains, surpassing all others in height and, apparently, reaching far above the region of the clouds. This is the more curious since the same idea is found among the ancient Babylonians and, according to Lenormant, among their Sumerian predecessors in the Euphratean valley (see JAOS, XXVI, 84). If among your readers any one has met with the same conception elsewhere in Greek literature, he will render a service to students of ancient cosmology by calling attention thereto in your columns.

William Fairfield Warren.

Boston University, March 2.

PERSONAL HISTORY.

To the Editor of The Nation:

Sir: We live in an age of particularity, and the writing of history has been affected thereby. To quote an editorial article which appeared some weeks ago in the *Nation*:

> History never permits real generalizations. . . . We talk of heroes, but mean Antony or Napoleon; we discourse concerning nations, but mean always Rome or England.

One may or one may not accept the theory of the Neapolitan philosopher, Benedetto Croce, partially exposed in this editorial; one must at least recognize the vogue of that theory. In France, men talk of the "personal conception" of history—which comes to much the same thing. To cite a concrete instance, in the preface of his most recent volume (the fourth series of

his admirable "Vieilles Maisons, vieux papiers"), Georges Lenôtre offers a defence of the history of individuals, as opposed to that of institutions. He pleads, to be sure, for no mere anecdotal history; rather for an *histoire romanesque*, for the literature of the *roman vécu*. How well M. Lenôtre succeeds in dignifying this somewhat perilous *genre*, most readers of the *Nation* are aware. But what kind of writing have we in this country, and in England, to fit into this department of the history of individuals, the *histoire romanesque*? This order of historiography seems almost to run parallel with the prevailing "impressionism" of contemporary literary criticism; to bear out the contention that we are, at the present epoch, more than commonly afraid of real ideas; hiding behind our emotions, or taking refuge in "documents." Without deciding for or against the "history of individuals," what are we doing in this fertile field?

To put it bluntly, we are pouring forth a dirty stream of books, whose authors, after raking the gutters and greenrooms (and other places, too), from the seventeenth century through the nineteenth, scoop up all of the old scandals that they think capable of "literary treatment," and even do their part in inventing more. The worst of it is that fair paper, clear printing, and fine illustrations lend these books —for the careless readers for whom they are intended—an unmistakable attractiveness. As one protestant against this variety of production has lately expressed it, "a mere string of *contes drolatiques*" is served up "with trite and insincere reflections upon comparative morality, obviously thrown in as a sop to Puritanism." Within a short time, a number of these books have been discreetly noticed in the *Nation*, though others—the greater part of them being, fortunately, of British confection—have passed unremarked.

I am not sure but that there is something less excusable, even, than this last kind of literature. What I am thinking of is our latter-day memoir of a man of letters, or a man of state, written, not to add to our knowledge or understanding of the genius, but to satisfy—or perhaps only to awaken—a certain prurient curiosity. Mr. Francis Gribble, to name a conspicuous offender, brings to his task a not inconsiderable acquaintance with the authorities—with the documents, even, in some cases. Yet how ignoble is the point of view suggested by such titles as "Chateaubriand and His Court of Women," "George Sand and Her Lovers," "Jean-Jacques Rousseau and the Women He Loved"! He espies in Chateaubriand only the lover who never "gave" himself, but only "lent." For him, George Sand has little or nothing of that noble nature (albeit unrestrained) that was capable of becoming the *grande mère de Nohant*, and Flaubert's devoted friend and counsellor. In Jean-Jacques, he sees only the Bel-Ami.

I do not ask a romanticising of history—literary or political. But if the tale is worth telling at all, let it be told decently. Is there no escape from the cheap cynicism of these contemporary biographers and memorialists, who smirch all that they touch?

Literature.

THE YOUNG EMERSON.

Journals of Ralph Waldo Emerson with Annotations. Edited by Edward Waldo Emerson and Waldo Emerson Forbes. Vol. I, 1820-1824; Vol. II, 1824-1832. Boston: Houghton Mifflin Co. $1.75 net each.

There are men who are so interesting to themselves that they keep their own archives. Unlike most of us, who are well content if the path close behind us as we go, these men conceive their lives as a whole, and require that the record of past selves be always at hand to confirm the self of to-day. The painter Elihu Vedder has filed away his slightest sketches from boyhood. It is such a record of an artist's life as probably has never before been made, and happily the essential part of it will be communicated. In general, the keeping of such archives implies that the life has been conscious, self-critical, and self-directed, and what is thus set down for personal guidance will almost always have an exemplary value for others. It is a just instinct that has induced two kinsmen of Ralph Waldo Emerson to publish generous extracts from the intimate journals which he kept for a matter of fifty years.

We first meet the future essayist, a Harvard junior at seventeen, and the author of blotting book "No. XVII." The numerical coincidence might lead one to suspect that he had kept annual records from his birth, but it is safer to assume that only the journals of four or five years are missing. Young Waldo, as his friends called him, is already a leading rhetorician in his class, an organizer and secretary of the short-lived Pythologian Society, a shrewd critic of such oratorical demi-gods as Everett and Ticknor, an imitator of the tropical eloquence of Chateaubriand, an indefatigable reader in older English literature and the classics. Such pursuits were inimical to regularity in class work, and the young sophist was graduated precisely at the middle of his class, being the last man to receive a commencement appointment. By academic standards, he had lived without infamy and without praise, and in the periods of depression and ill-health that followed his college days, he took this melancholy view of his own capacity and achievement.

As a matter of fact, he had done much. Aside from his constant rhetorical experimentation, he had enjoyed a fuller and more genial association with his fellow men than often came to him later. Not merely his phrases, but his thinking had been fined. Reflection already issued readily in opinion on all matters, and before graduation, we find established the lifelong habit of double transliteration of ideas into prose and verse. Water-color sketches of a certain character enliven his journals. At a later time he regretted that he had not followed the artist's career. To complete the romantic variety of college days came a strange infatuation for an underclassman, Martin Gay. His portrait is in the journal of 1820, above a poem by the limner. For a year or more, the two lads eyed each other uncomfortably, but Emerson never made the advance that might have converted the unspoken sympathy into a friendship. Characteristically also, he did not forget Gay, but followed his honorable career with interest. The scope of the undergraduate journals can only be indicated. They contain a considerable amount of sheer fustian, which presumably was not taken too seriously by the young rhetorician, but they also contain passages of a penetrating insight. He questions the nature of the pleasure arising from painting, and rejects the theory that it comes from resemblance to the object depicted. Against this Aristotelian view, he shrewdly cites the fact that much better facsimiles than painting, "a stone apple or fruit," do not yield this pleasure. "No," he concludes, "it arises from the power which we immediately recollect to be necessary to the creation of the painting." Whether this is or is not a good explanation, it virtually anticipates by two generations the psychological æsthetics of the French school. Of equal precocity is a passage on familiar eloquence, in which he writes:

> It appears to me that it is a secret of the art of eloquence to know that a powerful aid would be derived from the use of forms of language which were generally known to men in their infancy, and which now, under another and unknown garb, but forcibly reminding them of early impressions, are likely to be mistaken for opinions whose beginnings they cannot recollect, and therefore suppose them innate. At least, if by such operation they cannot convince the mind, they may serve to win attention by this awakening but ambiguous charm. By these forms of language I mean a paraphrase of some sentence in a *Primer* or other child's book common to the country. The spell would be more perfect, perhaps, if, instead of such a paraphrase, the words of a sentence should be modulated to the cadence of the aforesaid infant literature.

For a youth of seventeen the observation is surely extraordinary, and Emerson seems to have absorbed his own teaching. A marked virtue of his mature style is the racy and homely undercurrent of word and figure that enriches its superficial staccato elegance.

But Emerson's style seems almost an inheritance. Readers of Cabot's Memoir are no strangers to that remarkable "Aunt Mary" who stood in the stead of father and mother to the orphaned Emerson children. With Waldo at college she was in frequent correspondence,

and the topics were God and fate and faith and immortality. Aunt Mary appears to small advantage in extracts. Her style is not so much an anticipation as a curious caricature of that of "Nature" and the "Essays." She is full of what, but for prohibitory dates, one would call Carlylese exuberance. Rectify her diction, and you would get Emerson's. Whenever he writes of her in the journals his manner gains lift and warmth:

> The religion of my Aunt is the purest and most sublime of any I can conceive. It appears to be based on broad and deep and remote principles of expediency and adequateness to an end—principles which few can comprehend and fewer feel. It labors to reconcile the apparent insignificancy of the field to the surpassing grandeur of the Operator, and founds the benignity and Mercy of the Scheme on adventurous but probable comparisons of the condition of other orders of being. Although it is an intellectual offspring of beauty and splendor, if that were all, it breathes a practical spirit of rigid and austere devotion. It is independent of forms and ceremonies, and its ethereal nature gives a glow of soul to her whole life.

Bravo, Master Emerson, and congratulations not merely upon your graceful periods, but upon a leadership that shall take you serenely through hard years of religious readjustment.

The "Wide World" was the title that young Waldo gave to the journals of 1821 and later, after his graduation. He found it a cold world. For want of better occupation he turned to the drudgery of school teaching, lapsed into ill health, irresolutely studied for the ministry. A sense of failure beset his introspection. The journals abound in confessional passages of a morbid sort. At twenty, after reviewing the bankruptcy of high intellectual ambitions, he passes to more intimate issues:

> Look next from the history of my intellect to the history of my heart. A blank, my lord. I have not the kind affections of a pigeon. Ungenerous and selfish, cautious and cold, I could yet wish to be romantic; have not yet sufficient feeling to speak a natural hearty welcome to a friend or stranger, and yet send abroad wishes and fancies of a friendship with a man I never knew. There is not in the whole wide Universe of God (my relations to himself I do not understand) one being to whom I am attached with warm and entire devotion —not a being to whom I have joined fate for weal or wo, not one whose interests I have nearly and dearly at heart; and this I say at the most susceptible age of man.

Without questioning the sincerity of such an outburst, it needs very little literary experience to know that a grief so well and fully expressed is at least half-assuaged.

As the journals progress they become purged of mere happenings and more dense with thought—a little less interesting, one must confess, for they begin to suffer the formidable competition of his essays. Before twenty-one he had struck out clearly the theory of "difference of good" which underlies the famous essay on compensation. Everywhere the commonplace books yield fine extracts. We may note the whimsical prophecy of the phonograph conceived as a "Reading Steam-Engine. . . . Put in a pin and hear poetry; and two pins and hear a song." Of timely worth is an observation on the dangers of poetical religion. Certain vague and elevated expressions—he illustrates from Milton—"leave a self-complacency arising from having thought so nobly for a moment, which leads the self-deceiver to believe himself better than other men." The sombre dignity of a passage on the eternity of vice can only be hinted at. As a final illustration of the *pensées* that abound a definition of romance may serve:

> Romance grows out of ignorance, and so is the curse of its own age, and the ornament of those that follow. Romance is never present, always remote; not a direct but a reflected ray. . . . A Romantic age, properly speaking, cannot exist. . . . Heaven and earth hold nothing fanciful. As mind advances, all becomes practical. . . . Nevertheless, Romance is mother of Knowledge—this ungrateful son that eats up his parent. It is only by searching for wonders that they found truth.

The four years beginning with Emerson's majority were one long fight for health. Some hint of walking trips in New England there is, an inkling or two of the oratorical and theological ferment in Boston, but, generally speaking, the journals are barren of event except those of the inner life. When the young divinity student, in the winter of 1826-1827, makes his wise retreat to the South, the current of life runs stronger. There is talk of Southern courtesy. We glimpse that fine free-thinker, Prince Achille Murat, who later appears in the Essay on Friendship. A kind of stoicism begins to blunt the first twinges of hostile reality. Emerson faces himself and the world without illusions and without fear. During much of this time death was only around the corner. Emerson writes, "Go about your business, and when it comes to the point, then die like a gentleman." He accepts his limitations without the romantic heroics with which they were first perceived.

It is a solemn moment when he considers the mental breakdown of a loved brother, and realizes the taint in the family. Then he looks inward and faces the new peril. Quite dispassionately, he sees in himself a sluggish trait, and a "fund of nonsense," that must safeguard his sanity. So one by one the phantoms of greensickness and sheer debility are scrutinized and laid. Significantly his mind recurs to the topic of compensation. Now and then he wrestles with historic forms of skepticism, and weaves original, if also Cartesian, arguments, to certify his faith in a God and his hope of immortality.

In his twenty-sixth year, he was called to the pastorate of the historic Old North Church in Boston, and became the husband of Ellen Tucker. The latter bond was dissolved within a year and a half by death, the former a little later by difference of opinion. The church and the girl wife barely intrude in this chronicle of a soul. The church one can spare; one craves something more about that sensitive creature whose large eyes still look so understandingly at you from a portrait by an unknown artist. Waldo wrote to her a considerable amount of manly, if uninspired verse. His reverence for her is more than once adequately expressed, the stateliness with which he writes of her death has its poignancy also; but, in the main, her impress on the journals is as slight as that of a wandering star which trails down the evening heavens and disappears. Was Emerson fundamentally cold, as he so many times confesses himself to be, or are there depths of blessedness that want no transcription from life into letters? One would be glad of Ellen Tucker's answer to these questions, but since she never would have given it, we are bound to concede to the young bridegroom and philosopher the benefit of every doubt.

In any case, in the pulpit of the Old North and in chivalrous ministrations to the frail girl he loved, Emerson at last proved his capacity for life. The journals are silent as to the stages of this essential work of consolidation. One sees only the results of a quite routine social service, and of the self-abnegation implied in love. The romantic period of probation and bitter hesitation is past and the sage emerges. The conviction of a literary vocation which had glorified the undergraduate years returns as a sober purpose. In the journals of the late twenties and early thirties, we constantly find the golden streaks of prose and poesy that were later to be run into the ingots of his published works. Already a discerning person might have said of him what he himself writes of Coleridge.

> He has a tone a little lower than greatness—but what a living soul, what a universal knowledge! I like to encounter these citizens of the universe, that believe the mind was to be spectator of all, inquisitor of all, and whose philosophy compares with others much as astronomy with the other sciences; taking post at the centre and, as from a specular mount, sending sovereign glances to the circumference of things.

From the "specular mount" which the young widower occupied in Chardon Street glimpses of a promised land were already appearing. Notable reinforcement was coming to the sage of the New World from the seats of antique wisdom.

Some time in the year 1830, he read Carlyle's translation of "Wilhelm Meister." The bond with the church was insensibly loosening. The memorable *Wanderjahr* in Europe was already in mind. We may leave Emerson, no longer young at twenty-nine, with a prophetic entry on Carlyle, dated October 1, 1832:

> I am cheered and instructed by this paper on Corn Law Rhymes in the *Edinburgh* by my Germanick new-light writer, whoever he may be. He gives us confidence in our principles. He assures the truth-lover everywhere of sympathy. Blessed art that makes books, and so joins me to that stranger by this perfect railroad.

CURRENT FICTION.

Candles in the Wind. By Maud Diver. New York: John Lane Co.

This novel is the completion of a trilogy in which Mrs. Diver has striven to represent the problems and the heroism of Anglo-Indian life. The spectacle of quiet courage wrestling with the White Man's Burden is one that cannot fail to touch the imagination and stir the heart of all whose forefathers have in the past done battle with the wilderness, and whose children may in turn go forth to a similar struggle. In embarking upon so ambitious a treatment of this theme, Mrs. Diver challenges comparison with such writers as Kipling and Flora Annie Steele, and shows herself well able to bear the test. She chooses as her field the more feminine but no less stern problems of domestic life, and handles them with decision and delicacy, though with perhaps a shade too much of idealism. The dominant motive of "Candles in the Wind" is the danger of inter-racial marriage—that sore of Anglo-Indian life which Kipling has touched with the keen unhealing scalpel of an Ibsen. Mrs. Diver also presents it merely as a diagnostician; there is no remedy in her pharmacopeia.

Dr. Videlle is the son of a Scotch tea-planter and a Hindu wife, and while on leave in England has swept into marriage by the power of his own passion a girl of fine instincts and sensitive fibre, who mistakes her own half-pitying compliance for love. Videlle has deliberately deceived Lyndsay on the subject of his parentage, and when she discovers the truth upon their arrival in India, the bitterness of disillusion is increased for her by the very material pest of an impossible half-sister, child of the Hindu mother and an Eurasian second husband, whose presence in the Videlle household is taken for granted as necessary. James Videlle replies to his wife's protest with "It's—it's *dastur*" —custom—and she recognizes that he is sufficiently Asiatic to find that reason unanswerable. The sister's coarseness, jealousy, and spite widen the growing breach between husband and wife. The birth of a child betters the situation only temporarily, for Lyndsay is harrowed afresh to find that the little fruit of her hopes, being a daughter, seems to her husband only a disappointment. The tension reaches the snapping-point with the explosion of Videlle's frantic jealousy of Alan Laurence, an English gentleman, silently and hopelessly in love with Lyndsay.

The author has lavished care upon the depiction of the principal figures, but it is the minor characters that make the strongest appeal to the reader. It would be hard, for instance, to forget the incident that opens the book—the native road-builders convinced that the stability of the road is due to their propitiatory sacrifice and *poojah* to the god of the mountain, and not to the Englishman's foolishness in the matter of brushwork foundations. For those who have followed the fortunes of Desmond and Honor in "Captain Desmond" and of Quita and Lenox in "The Great Amulet," it is pleasant to find these old acquaintances playing a part in the present drama. Some of the descriptions of war, notably the capture of Fort Nilt, are done with a virile breadth that agreeably relieves the somewhat strained sentiment of the greater part of the book.

The House of the Whispering Pines. By Anna Katharine Green. New York: G. P. Putnam's Sons.

"A rambling, old country house, surrounded by pines; enter a man at midnight, believing it deserted; he sees a beautiful girl come down the stairs and depart; upstairs, he finds her sister, his fiancée, strangled; as he bends over the lifeless body, enter the police, summoned by a mysterious call; he is arrested"—so far the publisher's advertisement, which tells as much of the plot as any wise reader will care to know.

It is not a perfect detective story, perhaps not even the best of Mrs. Green's. The part of the detective proper, which, by all the rules of the game, ought to be the most important, is slight and not very interesting. The final climax is, indeed, a surprise, but attains that end by lugging in an agent who has hitherto been virtually out of the play: this is to practise an illegitimate trick on the reader, who has a right to expect that the author should set her wit against his by cunningly devising probabilities, not by a *deus ex machina*. On the other hand, the preliminary climax —for there are two distinct revelations, the first only adding to the final mystery—is forstalled by an injudicious, and quite inartistic, frontispiece, which tells the reader too clearly what he is to expect. Despite these blemishes, the plot is extraordinarily clever and is grewsome just to the right point. The characters, with the exception of the detective who is on the scene only part of the time, are individualized far beyond what one expects in a detective story, and their traits are not extraneous to the events, but essential to them. The love motive, which is usually a sheer nuisance in this *genre* of fiction, is in itself interesting and is an integral part of the plot. It is a book to read.

Mary Cary. By Kate Langley Bosher. New York: Harper & Bros.

This is the story of an orphan who comes at last after many years of dreary asylum life to the love of kindred and the comfort of a "home with a little h"—that sanctuary so desired by Timothy of the Quest. Mary Cary—"frequently Martha"—involves in her own story the romance of her beloved Miss Katharine, and it is her courageous interference in the impeded course of true love, that brings about the happy ending. The book is wholesome and entertaining, but the effect is marred by the form in which the story is cast—that of Mary's diary. The quaint and quotable sayings are far too mature in their point of view and expression for a child of eleven, even so remarkable a child as Mary; and what would have seemed natural and delightful as the utterance of an older person strikes a jarring note. It is more the speech of a shrewd, though unschooled adult, than of a precocious child. Mary, as she is represented, is one of those children rarely possible in nature, never in nature's black and white garb of print. One may, however, accept joyfully and uncritically such pithy sayings as that of the really childish Sarah Sue: "Father is just my father by marriage, but mother's my mother by bornation. I think mothers ought always to have the most."

The Fortune Hunter. By Louis Joseph Vance. New York: Dodd, Mead & Co.

In commenting the other day on Mr. Vance's latest invention, "The Pool of Flame," we noted his confession of ability to invent local color of a verisimilitude to deceive the native without pain of sojourn or even travel in foreign parts. From the evidence of "The Fortune Hunter," we should judge it safer for him to dispatch his fancy as far afield as possible. It may disport itself more plausibly (to the American reader of romance) in Calcutta or Morocco than in the Pennsylvania village which is the scene of its present activity. The feeble conventionality of the rustic scenes and characters here portrayed is doubtless due in part to the tale's derivation. If not precisely a "novelized" play, the plot is confessedly "taken from the comedy of the same title," by Winchell Smith. It cannot be said that the story-teller has been successful

in his attempt "to tell the story as though it had occurred to the writer as material for a novel, rather than for the stage." As is common with adaptations of this kind, the creak of the theatrical machinery is plainly audible above the studied monotone of the narrator.

The borrowed idea is amusing. A young New Yorker of good birth and luxurious upbringing has been thrown upon his own resources. Various business openings are found for him by a college friend, but he can make nothing of them. The friend, a thriving broker, has one more suggestion of a way to make a million in a year. The scheme is simple. "Think of the country heiresses," cries its promoter, "with plenty of money for two, pining away, . . . hundreds of them, fine, straight girls, girls you could easily fall in love with, sighing their lives away for the lack of the likes of you." The experiment is made, with perfect success; but, of course, the hero does not marry the country heiress, or he would cease to be the hero. The problem is to have him marry the poor girl of his heart without remanding him to poverty: a problem which an experienced spinner of yarns like Mr. Vance could have no sort of difficulty in solving.

ONE OF INDIA'S RELIGIONS.

The Sikh Religion: Its Gurus, Sacred Writings, and Authors. By Max Arthur Macauliffe. Six volumes. New York: Henry Frowde. $19.25.

More than thirty years ago, the Sikh religion was studied at first hand, the most important documents relating to and incorporating its tenets were translated, and the result of many years' study on the part of a patient German scholar was published under the title "Ādigranth, or The Holy Scriptures of the Sikhs." It is with some surprise, therefore, that one opens Mr. Macauliffe's "Sikh Religion," and reads the first sentence of the author's preface: "I bring from the East what is practically an unknown religion."

It is true that Trumpp's translation of the "Ādigranth" left untouched many texts, which the writer did not care to translate, and that his translation, like all first attempts, left much to be improved. But for all that, Dr. Ernest Trumpp, and not Max Arthur Macauliffe, is the man who first brought from the East the records of what, at that time, despite the work of still earlier investigators, was "practically an unknown religion." Nor does this new translation really add very much to our comprehension of that religion as a whole, not enough to alter materially our estimate of its character or of its originality. In fact, in some particulars, Trumpp gives a clearer sense of the attitude of the Sikhs toward the religious environment of the founders than does Macauliffe, notably, where Trumpp retains Hari (the name of Vishnu-Krishna) as the designation of the Supreme Being, which in Macauliffe appears as "God." Some of Nānak's sayings, in both versions, will show how truly the essence of the matter was given by the scholar whom Mr. Macauliffe barely mentions, and mentions only to depreciate. Thus, from the "Japji":

True is the Lord, of a true name, in language his love is infinite. If they speak and ask, he gives, he gives, the Liberal bestows gifts. What shall be placed before (him), by means of which his court may be seen? What speech shall be uttered by the mouth, which having heard he may bestow love? (Trumpp).

There is the Lord, true is His name; it is uttered with endless love [also translated: His attributes are described in endless languages]. (People) pray and beg, Give us, give us; the Giver giveth His gifts. Then what can we offer Him whereby His court may be seen? What words shall we utter with our lips, on hearing which He may love us? (Macauliffe).

Again, from the "Sohila":

Thousands are thy eyes, and (yet) thou hast no eye; thousands are thy forms, and (yet) thou hast not one. (Trumpp).

Thou hast a thousand eyes and yet not one eye; thou hast a thousand forms and yet not one form. (Macauliffe).

There are many infelicities in Trumpp's translation, due partly to its English dress, and also many inaccuracies, due in great part to its being a first attempt; but to stigmatize it as "generally inaccurate" is a gross exaggeration. Trumpp published in English his "Ādi-Granth" in 1877 and his shorter sketch in German, "Die Religion der Sikhs," in 1881. Both of these works contain histories of the Gurus or pontiffs (literally "venerable teachers") of the Sikh sect, which was one of many reforming sects current in India in the fifteenth century. It harks back to Kabir and the reformers of the South, whose doctrines soon became current all over India. The new history of Mr. Macauliffe does not essentially change the data presented in these earlier histories. According to both historians, Nānak, the son of a farmer and the founder of the sect, was born near Lahore in the Punjab in 1469. He saw visions, was regarded as a lunatic, had an interview with God, was appointed God's prophet on earth, and founded the long line of pontiffs of the Sikhs, who under Govind (the tenth pontiff, died in 1708) were converted into a formidable military organization. The first scholar of this line of peasants was the fifth pontiff (Arjun, died in 1606), who compiled the Granth, or bible of the sect, from the reputed sayings of Nānak and others. The religion contributed not a single new idea to Hindu thought. There was nothing in it that had not been familiar to Brahman and Buddhist for a thousand years or more. It insisted upon real religious feeling as a substitute for formality and idolatrous worship; but so did the older Hindus. It added emphasis to the oneness of God; but in this it aped the Mohammedans, its leaders being too ignorant to go further back and find the unity of the godhead in the native scriptures of India. Mr. Macauliffe seems to imagine that Sikh thought was in itself really important, that it gave out something new; he even proclaims that the first Guru (teacher) had a higher ethical ideal than either Hindu or Mohammedan was capable of attaining. In this respect Mr. Macauliffe's further lack of insight is shown, when he asserts that the Sikh religion was "totally unaffected" by Semitic influences. A religion which consigns sinful souls to the care of "Azrael," which includes in its canon the writings of at least two Mohammedan saints, and which Mohammedanism surrounded from its inception, cannot be so independent as Mr. Macauliffe would have us believe. As for originality, in respect of Hindu thought, Trumpp made a correct estimate of the Sikh teaching, when he said: "The chief point in Nānak's teaching was the unity of the Supreme Being, though this was nothing new to the Hindus." The exaltation of the Guru, or teacher, to the place of pope, the fact that salvation depends on the Guru, that the Guru has a magical power, that divine wisdom is mysterious, that, to whisper this mystery into his ear is about the only instruction given to the pupil—all this accounts for the degradation of the religion, as much as does the outer environment.

From a philosophical point of view, the hymns and epigrams of the later pontiffs are of no importance. But from the historical standpoint, there is real value in the complete collection here brought together. The lives of the pontiffs also deserved to be written in full and it was a happy thought to imitate Trumpp and get all the assistance attainable from the few native scholars capable of helping a European in any matter of scholarship. Considering that Mr. Macauliffe is not a trained scholar, and that he was engaged in official business till it occurred to him to become the historian of the Sikhs, we cannot but applaud his courage in undertaking so scholarly a work. Moreover, although his historical sense is weak, he has added materially to what had previously been done, and, as a real contributor to our knowledge of Sikh literature, deserves considerable praise. In these six volumes the reader may peruse the lives and writings of the Sikh pontiffs and their immediate predecessors, with the assurance that both history and translation are at last as accurate as they probably ever will be. The Introductory study of the life of each Guru presents new matter, and the translation

generally improves on that of Trumpp (where it follows the same text), besides adding a noteworthy body of material expressly ignored by Trumpp, because he did not think it worth translating. As an official in the Punjab, the author had an exceptional opportunity to make the preliminary studies necessary to the undertaking here happily completed and he has done well what he set out to do. It is a pity, however, that the latter sects were not treated more fully. Here there is a lack still to be adequately supplied. It is also to be regretted that Mr. Macauliffe has not shown a more just, as well as more generous, appreciation of what others have done.

The Cambridge History of English Literature. Edited by A. W. Ward and A. R. Waller. Vol. IV: Prose and Poetry; Sir Thomas North to Michael Drayton. New York: G. P. Putnam's Sons. $2.50 net.

The interest of such a work as this history of English literature is bound to fluctuate with the nature of the material which is dealt with in the successive volumes, and, as it happens, the material which the present volume embraces is, taken as a whole, not of the most interesting character. There are some notable exceptions, of course—Raleigh, Bacon, Donne, Burton, and the Authorized Version of the Bible—but the great names, for the most part, belong to other volumes. Sidney and Spenser are behind us, Shakespeare and the whole starry host of the Elizabethan dramatists are still to come. The best poetry included in the present volume, being lyrical, is the most difficult to make interesting in a critical exposition. In addition, it must be confessed that, with the exception of Mr. Whibley's treatment of the Elizabethan translations, there is singularly little distinction of style in the various chapters. This accords with the paucity of eminent names among the contributors; but, after all, we fear that it is the fault of our generation rather than of the editors that, despite the competence in scholarship which they may justly claim for their collaborators, there should be so little of the *vis viva* of literary criticism in most of the chapters that deal with literature, pure and simple. One feels that the generation which produced the first series of Morley's "Men of Letters" would have made a better showing in this respect, if indeed it is conceivable that so distinguished a band of critics (of whom, to be sure, a few are still active) would have submitted themselves to the yoke of science in the form of an enterprise like the present one. In any event, some of the best chapters in the volume before us—for example, Archdeacon Cunningham's on Early Writings on Politics and Economics, H. G. Aldis's on The Book-Trade, 1557-1625, and J. Bass Mullinger's on The Foundation of Libraries—deal with matters which, though of great importance, are merely subsidiary to literature, properly speaking.

Of the four authors to whom separate chapters are devoted, viz., Raleigh, Campion, Drayton, and Donne, the last-named has been the most fortunate in his critic, Prof. H. J. C. Grierson of the University of Aberdeen. Mr. Grierson has given us an adequate picture of this original and complex personality, and he has indicated very justly the influences which entered into his genius. We miss, however, any comment (except in the case of the satires) on the peculiar rhythms of Donne's verse which have been so subtly characterized of recent years on this side of the ocean by Prof. H. M. Belden. Neither can we share in the author's apparent admiration for Donne's letters, which strike us as among the most unreadable compositions that ever came from the pen of a great author. On the other hand, the letters of his friend, Sir Henry Wotton, the earliest in our language, as it seems to us, that possess literary charm, are passed over in silence in this history.

Prof. Albert S. Cook, the only American contributor to the present volume, has written interestingly of the early translations of the Bible, and especially of the Authorized Version and its influence. It seems an indiscriminate criticism, however, which in a characterization of the Bible makes no distinction between the Old and the New Testament. There is surely an enormous difference between the two. Vast, moreover, as the influence of the Bible has been in the sphere of morals, it is an exaggeration from the purely literary point of view to speak of it as "possessing a universality which has placed it at the foundation, or the head, or both, of all modern literatures." This might much more truly be said of the literature of Greece. Professor Cook discusses satisfactorily the nature of the influence which the Authorized Version has exercised on subsequent English literature, but his conclusion from the limited vocabulary of the Bible as compared with Shakespeare's abundance, viz., that "the capacities of words, especially of the simpler words, are much greater than is believed by those who use a large and heterogeneous vocabulary" seems beside the mark. The greater complexity of the civilization which Shakespeare's plays reflect and the immense variety of subjects which he wrote about, of human facts and relations that he touched upon, as Professor Jespersen has reminded us, will account for the difference. It strikes, us, too, as hardly fair to Shakespeare when Professor Cook contrasts to his disadvantage the praise of man in "Hamlet," Act ii, Scene 2—"What a piece of work is a man!" etc.—with the famous passage in the Eighth Psalm, "What is man that thou art mindful of him," etc. In the first place, the latter is hardly genuine prose. The Hebrew original is a lyric and the lyrical rhythm in the English translation is unmistakable and an important element in its beauty. Furthermore, the prevailing quality of the passage from the Psalm is sublimity, for which there is no place in Hamlet's speech. Indeed, it is the adoration of God's omnipotence even more than the exaltation of man that finds its expression in the words of the Hebrew poet. And in addition to all this we must take into account, as Professor Cook himself acknowledges, the dramatic fitness of the passage in "Hamlet."

Some of the more important authors find competent treatment in chapters which deal with various branches of literature—Burton in a chapter by Edward Bensly, which also includes the Latin writers, Barclay and Owen; Bacon in the chapter on the Beginnings of English Philosophy, by W. R. Sorley; Nash, Greene, and Dekker (as prose-writers) in one on Popular Literature by H. V. Routh. There are, besides, chapters which add greatly to the usefulness of the work as a book of reference, viz., The English Pulpit, by F. E. Hutchinson, Writers on Country Pursuits and Pastimes by H. G. Aldis, and Literature of the Sea and Seafaring and Travel by C. N. Robinson, R.N., and John Leyland. The very ample bibliography at the end of the volume is not the least valuable part of it.

The editors announce that Vols. V and VI will deal with the English Drama down to 1642, and Vol. VII with non-dramatic literature, mainly of the period between 1625 and 1660. The last-named volume is to appear before the end of the year.

The Decay of the Church of Rome. By Joseph McCabe. New York: E. P. Dutton & Co. $2.50.

Dr. McCabe, a former Catholic and member of the Franciscan Order, is known already for more than one sharp attack on the church of his youth. The present volume is an elaborate statistical study in demonstration of the thesis that "instead of showing signs of increase the Church of Rome is rapidly decaying, and only a dramatic change of its whole character can save it from ruin." The author claims to be entirely unprejudiced in his treatment of the matter, but neither his past relations with the Catholic Church nor the book itself inspires confidence in his freedom from bias. Such statements as the following reveal his general attitude:

> Catholic countries are disappearing from the map of the world (p. 13).

A day will come when historians will wonder how the Vatican ever acquired a reputation for statesmanship. In the small momentary ruses of diplomacy it has usually been able to command the services of skilful men, but its whole management of the Latin races has been devoid of any large statesmanship (p. 12).

Contrary to a widespread conviction, there has been no progress made by the Roman Church during the nineteenth century in any normally educated portion of the English-speaking world (p. 194).

This rapid survey will show the reader at once that the terrible figure of 120,000,000 illiterates in a total of 190,000,000—a figure that, of course, I have obtained by careful analysis—is in reality a very moderate one. It means, in plain English, that the majority of the Roman Catholics of the world to-day consist of American Indians, half-castes, negroes, and mulattoes; Italian, Spanish, Russian, and Slavonic peasants of the most backward character; and Indian, Indo-Chinese, and African natives. These make up much more than half of the whole. Further, the great bulk of the remainder are the peasants and poor workers of Germany, Austria, France, Belgium, and Ireland. . . . When we note the extraordinary impotence of Catholicism in the great cities of Europe; when we learn in country after country, that the middle class forsook it a generation ago, and the artisans are abandoning it to-day; when we find its authority rejected almost in proportion as a nation is touched with culture; and when we see that its larger tracts of unchallenged authority so constantly correspond with the darker areas in the cultural map of the world—we see that its power rests largely on a basis that is directly and triumphantly challenged by the modern spirit—a basis of ignorance (p. 305).

That the figures of the book differ so widely from those ordinarily given by statisticians both Catholic and Protestant is explained by such a passage as the following, which shows how the author ventures to go behind the official returns:

But I decline to regard as a Catholic one who never goes to mass or Easter communion, or who habitually supports political parties that are sternly condemned by, and openly hostile to, the Church. Where there is obviously neither belief nor obedience to commands that, on the most familiar Catholic principles, bind under pain of eternal damnation, I do not see how a census declaration that one is a Roman Catholic can be taken seriously (p. 301).

Of course, any study based upon such a method of computation is liable to large error, and from the same figures many others, even Protestants, would draw vastly different conclusions. Not a few of the facts given and some of the results reached are indisputable, even though surprising to any one who has not already looked somewhat carefully into the matter. That the Roman Catholic Church has been losing ground in other countries as well as in France during recent decades, and that the authorities of the church are themselves alive to the fact, cannot be doubted. But the situation is by no means so serious as this book represents it. A similar method applied to Protestantism would in many cases lead to similar results. Lukewarmness toward the church, or even open hostility to it on the part of large sections of the population, is no sign of a speedy dissolution, as history has abundantly shown. It is easy to predict imminent disaster, but those who so prophesy know little of the reserve force and recuperative power of Christianity, whether Protestant or Catholic.

Sir Henry Vane, Jr., Governor of Massachusetts, and Friend of Roger Williams and Rhode Island. By Henry Melville King. Providence, R. I.: Preston & Rounds Co. $1.25 net.

The memorable friendship between two great leaders in the cause of political and spiritual freedom finds here a worthy setting forth. Few men of the seventeenth century are better worth remembering, and Dr. King does a service in showing how they helped each other, culling out from the stormy career of each champion the facts bearing upon their mutual relations, and including them in a little book by themselves. He addresses especially Rhode Islanders; speaker and audience being, of course, imbued with the Rhode Island tradition, which has been held most tenaciously in every generation. The calm and tolerant William Bradford of Plymouth characterized Roger Williams as "a man godly and zealous, having many precious parts, but very unsettled in judgment." Your true Rhode Islander, and Dr. King is one, admits no shortcoming in his saint, nor would Dr. King's special audience take kindly to any such suggestion. But outsiders must be pardoned for deferring much to Bradford, who basked under the immediate effluence of the halo, and for believing, while greatly admiring Roger Williams, that his unsettled judgment, combined with his extraordinary force, made him in trying times an uncomfortable, not to say dangerous, neighbor. As the saint was impeccable, so in Dr. King's view was the saint's friend. Dr. King appears to believe that Vane at the outset, in Massachusetts, though scarcely out of boyhood, was yet a character fully formed; that he was an Independent in religion, a republican in politics, an out-and-out champion of freedom of conscience; that he received no impress from the strong men by whom he was surrounded; that in his later career his course was invariably wise. Dr. King seems to adopt Wendell Phillips's conception, that, while for other men we are obliged to walk backward, casting a mantle over their infirmities, and saying "Remember the temptation and the age," Vane never fell below the highest standard. We think it would be truer to say that Vane in Massachusetts was quite unformed. Religiously he showed small trace of the fanaticism which in later life carried him to unintelligible lengths; and as regards tolerance, while his utterance in the controversy with Winthrop is indeed noteworthy, it is obscure and hesitating as compared with later declarations. In politics, it cannot be shown that Vane stood on republican ground till after 1648, after the rank and file of the Ironsides had made their stout push for sovereignty of the people.

In Massachusetts he stood for the authority of the King. This appears in his controversy with Winthrop, as well as in his course against the zealots who cut the cross out of the royal ensign. He had the ensign unfurled at the Castle. He accepted knighthood and preferment from the King, sullenly we grant; but "root and branch" man though he soon became, it was long before he dropped allegiance to the ancient triple-pillared polity of England: King, lords, and Commons. With Pym and Hampden, in the first years of the Long Parliament, he stood for a proper balance there against the danger of an overweight in the royal prerogative. The radical programme was some years in the future.

Is Vane's "ermine" quite so "spotless" as has been claimed? Milton calls him skilful

> . . . to unfold
> The drift of hollow states hard to be spelled.

He was matchless in unearthing the plots of foreign foes and secret enemies at home, and it is hard to see that he did not sometimes fight the devil with his own fire here. His course in the movement which finally brought Strafford to the block ought, we think, to give pause to those who claim for him the finest sense of honor. The negotiation of the Solemn League and Covenant, which brought the Scots, in 1643, to help the perishing cause of the Houses, was a masterpiece of astuteness; but the Scots loudly declared they had been "cozened," a cry which the Cavaliers reëchoed. They were Vane's enemies, no doubt deserving little sympathy, but will the careful modern reader say that this transaction was thoroughly fair and above board? Does not the subtlety in the engineering of the Self-Denying Ordinance savor overmuch of the wisdom of the serpent? With all due respect for Wendell Phillips, we think we are sometimes obliged in Vane's case to say: "Remember the temptation and the age." The stress was great, treachery was to be met, the spirit of Machiavelli pervaded the statesmanship of the time. We hold that Vane did not come out of that bat-

tle without some taint in his garments of the infernal smoke.

Dr. King's book is interesting, and it is well to have emphasis put on Vane's share in promoting the welfare of early Rhode Island. The heroes in Dr. King's foreground were men of rare power and high purpose, but with all their gifts and virtues only human instruments.

The Disappearance of the Small Landowner. Ford Lectures, 1909. By Arthur H. Johnson. New York: Henry Frowde. $1.75.

The striking fact about rural England, as has been proclaimed in shrill accents many a time during the past weeks, is the concentration of the land in a few hands. Careful estimates based on the new Domesday Book of 1876—and there have not been great changes since then—indicate that in England there are only about 260,000 persons who hold land from one acre upwards, whereas in France, with a population only one-third larger, there are some 5,600,000 landed proprietors. In the Ford Lectures for 1909 Arthur H. Johnson took up this question of the disappearance in England of the small landowners, and sought to explain how and when this remarkable divergence between England and France took place. Though the lectures as printed form but a thin volume, they give a good summary of the most recent literature dealing with English agrarian conditions from the thirteenth century to the present day. The author has not depended, however, by any means on secondary authorities, but bases many of his conclusions upon his own investigations both in the contemporary literature of the various periods and in the statistical material to be found in the Tudor and Stuart Surveys and in the Land Tax Assessments for the period since 1750. He is almost the first investigator to call attention to the historical importance of these Land Tax Assessments. From them he says we can learn whether farms were being consolidated or whether they were being broken up into smaller ones, whether the numbers of owners wax or wane. We can trace the building up of large estates and their dispersion.

The more important of his conclusions deserve to be stated. He thinks the influence of primogeniture and the law of entails, so often alleged as a cause of the growth of large estates, has been enormously exaggerated. He thinks, likewise, that historians have laid too much weight upon the agrarian effects of the Black Death, and paid relatively too little attention to the dislocating and social effects of the increasing trade and industry and spirit of competition and capitalism of the fifteenth century. He believes Professor Gay has gone too far in minimizing the extent of enclosures from 1450 to 1600. But the period that was most fatal to the small landowner, owing to a variety of causes which the author analyzes, was from the close of the seventeenth to the middle of the eighteenth century, the period of the final transition from mediæval to modern agricultural conditions. On the evidence from the Land Tax Assessments he thinks the changes due to enclosure and consolidation since 1750 are not so radical as they have generally been supposed to be.

While at points the author's conclusions seem to lack full convincing evidence (notably in the generalizations in the last chapter in regard to continental analogies), the little volume on the whole is sound and a valuable corrective to many current notions on English agrarian conditions.

Notes.

Henry Holt & Co. announce that De Alva S. Alexander has undertaken a fourth volume of his "Political History of the State of New York," the third volume of which brought the narrative down to Cleveland's election as Governor of the State in 1882.

The Houghton Mifflin Co. has the following books on its spring and summer list: Fiction—"The Duke's Price," by Demetra and Kenneth Brown; "The Right Stuff," by Ian Hay; "The Twisted Foot," by Henry Milner Rideout; "An Army Mule," by Charles Miner Thompson; "The Godparents," by Grace Sartwell Mason; "Country Neighbors," by Alice Brown; "The Royal Americans," by Mary Hallock Foote; "The Professional Aunt," by Mary C. E. Wemyss; "Little Brother o' Dreams," by Elaine Goodale Eastman; "John Forsyth's Aunts," by Eliza Orne White. For children—"Flutterfly," by Clara Louise Burnham. Drama—"Husband and the Forbidden Guests," by John Corbin. Outdoor books—"Sport and Travel in the Far East," by J. C. Grew; "Wilderness Pets," by Edward Breck; "Swimming," by Edwin Tenney Brewster; "Notes on New England Birds," by Henry D. Thoreau; "Little Gardens for Boys and Girls," by Myrta M. Higgins. Present-day topics—"Personal Power," by William Jewett Tucker; "The Health of the City," by Hollis Godfrey; "The Conquest of Consumption," by Woods Hutchinson, M.D.; "Every-Day Business for Women," by Mary A. Wilbur; "Wool-Growing and the Tariff," by Chester W. Wright; "Copyright: Its History and Law," by Richard Rogers Bowker. Essays and literature—"Essays on the Spot," by Charles D. Stewart; "At the Sign of the Hobby-Horse," by Elizabeth Bisland Wetmore; "An Approach to Walt Whitman," by Carleton Noyes; "Letters to My Son" (anonymous); "A Study of the Drama," by Brander Matthews; "English Literature in Account with Religion," by Edward M. Chapman. Biography and history—"The Life of Mary Lyon," by Beth Bradford Gilchrist; "My Friend the Indian," by James McLaughlin; "Colonial Mobile," by Peter J. Hamilton. Travel—"The Russian Road to China," by Lindon Bates, jr.; "1910 Satchel Guide to Europe," by W. J. Rolfe. For the bride-to-be—"Her Book," by Mabel M. Swan. Philosophy and religion—"The Principles of Pragmatism," by H. Heath Bawden; "The Earliest Sources for the Life of Jesus," by Francis Crawford Burkitt; "Paul and Paulinism," by James Moffat; "The Church and Labor," by Charles Stelzle. Poetry—"Complete Poems of Richard Watson Gilder"; "Poems of Belief," by Theodore C. Williams. Riverside Press editions—"A Poet in Exile," being some early letters of John Hay; "Pan's Pipes," by Robert Louis Stevenson. Educational—"American Education," by Andrew S. Draper; "The Principles of Education," by William C. Ruediger; "The First Book of Stories for the Story-Teller," by Fanny E. Coe; "European Hero Stories," by Eva March Tappan; "The British Isles," by Everett T. Tomlinson; "Little-Folk Lyrics," by Frank Dempster Sherman; "Old Ballads in Prose," by Eva March Tappan; "The Basket Woman Stories," by Mary Austin; "Everyman, The Second Shepherd's Play, and Other Miracle and Folk Plays," edited by Clarence Griffin Child, professor of English in the University of Pennsylvania; Mrs. Gaskell's "Cranford," edited, with complete introduction, notes, questions, and suggestions, by H. E. Coblentz; "A Translation of the Æneid of Virgil," by Theodore C. Williams, formerly head master of the Roxbury Latin School; "Selections from Irving's Bracebridge Hall," edited by Samuel Thurber; Thoreau's "Walden," edited by Francis H. Allen.

Little, Brown & Co. announce the following spring publications: "Passers-By," by Anthony Partridge; "The Up Grade," by Wilder Goodwin; "The Snare of Circumstance," by Edith E. Buckley; "The Illustrious Prince," by E. Phillips Oppenheim; "Over the Quicksands," by Anna Chapin Ray; "The Red House on Rowan Street," by Roman Doubleday; "The Pursuit," by Frank Saville; "An American Baby Abroad; How He Played Cupid to a Kentucky Beauty," by Mrs. Charles N. Crewdson; "The Red Symbol," by John Ironside; "Just Between Themselves," by Anne Warner; "The Garden and Its Accessories," by Loring Underwood; "Play: Games for the Kindergarten, Playground, School Room, and College," by Emmet Dunn Angell; "Caleb Trench," by Mary Imlay Taylor; "The Dominion of New Zealand," by Sir Arthur P. Douglas; "The Works of Charles Dickens," Centenary Edition, complete in 30 volumes, 12mo, uniform in size with the Centenary Edition of Balzac; New Editions of the Works of Selma Lagerlöf (winner of the Nobel literary prize of $40,000): "The Story of Gösta Berling," "Invisible Links," and "The Miracles of Anti-Christ"; "Red Horse Hill," by Sidney McCall; "Redney McGaw," by Arthur E. McFarlane.

The *International Bibliographer*, a monthly magazine, to be edited by Dr. George Eller, will make its first appearance in April. In scope it will include the principal publications of Great Britain, France, Germany, Italy, and other countries. It is to be published by Erskine MacDonald of Surrey Street, Strand, London.

Sir Horace Plunkett's articles in the *Outlook* on the conservation policy in general and American farming in particular combine breadth with accuracy of view. The

writer is not only intimately familiar with conditions in this country, but has a wealth of experence to draw upon from his labors during many years for the improvement of agriculture in Ireland. The title of his last article, "Better Farming, Better Business, Better Living," suggests the scope of his contention. It is, in brief, that farming in the United States has been far too crude and exhaustive of the soil, and that the advance towards more scientific methods now made with the assistance of the Department of Agriculture, ought to be accompanied by great changes in farming regarded as a business. Sir Horace points out the unused opportunities for coöperation in marketing products, and shows how far behind the Irish and the Continentals are our American farmers in this respect. His plea is as finely intelligent as it is ideal, and is a valuable contribution to the whole discussion.

Some things have changed, and changed for the better, since Gideon Welles set down in his diary—as appears in the March *Atlantic*—the following entry under date of October 13, 1865:

Stanton took occasion before the President came in to have a fling at my circular against party assessments, which seems to annoy him. I told him the principles and rule laid down in that circular were correct; that the idea, which he advocated, of a tax upon employees and officeholders, was pernicious and dangerous, and if permitted to go on would carry the country to the Devil. Stanton said he then wished to go to the Devil with it, that he believed in taxing officeholders for party purposes, compelling them to pay money to support the Administration which appointed them. Weed and Raymond are in this thing, and mad with me.

Secretary Welles was in advance of his time; and Henry J. Raymond, one of the most accomplished of American journalists, was simply with the crowd when he stood by the old war-horse Stanton and that seasoned veteran of politics, Thurlow Weed, in favor of the backsheesh idea of public service. It is well to be reminded, once in a while, in so specific a way, of the vital necessity that existed for civil service reform, of the radical change that it brought about in time to keep the country from "going to the Devil," and of the lonesome work that a few men had to do for about fifteen years before they got a lodgment for the reform in the statute books of the nation.

The Harpers have begun to publish a pocket-size thin-paper edition of Thomas Hardy's novels. 'The Return of the Native," often considered the most powerful of Hardy's stories, has already appeared, and "Jude the Obscure" is soon to follow. In the volume we have received the ink is somewhat pale and the printing occasionally imperfect, defects which may well be corrected at once, for in size, type, and style of binding the books promise to be convenient and attractive.

To the growing literature of the short story, William J. Dawson and Coningsby W. Dawson, in collaboration, have contributed two volumes entitled "The Great English Short-Story Writers," published by Harpers as part of the Readers' Library. Vol. I contains thirteen specimens by authors born in or before 1850, none of them living, except Mark Twain, Thomas Hardy, and Henry James, and none of whom wrote before the nineteenth century, except De Foe, whose "Apparition of Mrs. Veal" is happily included. It also contains an introduction which with prodigious dexterity traces the "evolution" of the form in twenty-eight pages from the savage tale through the "Gesta Romanorum" to Poe. The preamble to Poe is about as "sequacious" and convincing as an account of the evolution of the New York politician, which should begin with Adam, leap to Elder Brewster, and end with Richard Croker. Vol. II contains thirteen specimens by living writers, and an introduction on the "modern short-story." Most of these selections are sufficiently interesting narrative material, but three of the longest—R. H. Davis's "The Exiles," Kipling's "The Man Who Would Be King," and Margaret Deland's "Unexpectedness of Mr. Shields"—grossly violate the laws of technique laid down in the introduction.

There would be no occasion to speak of the evasions and sophistries and extravagancies of the introduction, except for the fact that the book is intended for the unsophisticated, and for the additional fact that its most flagrant faults are constantly committed by other exponents of the *genre*. With bovish enthusiasm, the authors, ignoring Emerson, Coleridge, Victor Hugo, Balzac, Heine, Goethe, *et al.*, declare that Poe was "the highest and rarest genius not only of his nation, but of his age." On what grounds? Well, mainly, it should appear, because only Sir Conan Doyle is as ingenious as Poe; because Jules Verne was not his equal in adventure; and finally, as a clincher, because no one else whatever has been so horrible. But our authors are not concerned merely for the rank of Poe; they are bent upon the apotheosis of the short story. They manage it thus: having put Poe at the head of the age, they remark with quiet significance, "He found in it [the short-story], a sufficient vehicle for his genius"—as who should say, "the drama?—it was big enough for Shakespeare." Still the argument runs a little circular. They buttress it with a string of analogies like this: "A fine intaglio may be as great a work of art as a Grecian statue"—a position which is unassailable, if only the Grecian statue is worthless; but why not insert the word "fine" before the statue, as before the itaglio? All that their illustration comes to is this: A little thing perfected is better than a big thing spoiled; a sound canoe is more valuable for navigation than an ocean liner that will not float. Yet, upon such a base, they build this grave announcement: "Gradually men have come to see that a perfect short-story demands an art even more delicate and rare than a novel." Again, we ask, why not say a perfect novel? And if the talent for writing short stories is so rare and delicate, what shall we make of this: "America has not yet produced a novelist of the calibre of Dickens or Thackeray, or Meredith or Hardy; but it has produced a *host of short-story writers of incomparable excellence*" (our italics)? Dear saints, then we have a "host of writers" here in America with a talent more delicate and rare than that of Thackeray or Hardy? What shall we make of this: "Ambrose Bierce and Lloyd Osbourne . . . have done work [in the short-story] so admirable that it does not suffer greatly in comparison with that of the most famous writers"? What shall we make of this: "In no other country, except France, is it possible for a writer to make a reputation upon a single magazine story; but in America this has happened more than once"? It does not seem to have struck our authors that anything can be wrong with America. But is it not time to come to an end with this nonsense about the short-story?

Of "Labrador, the Country and the People" (Macmillan), about two-thirds were written by Dr. Wilfred T. Grenfell and the rest by competent scientific specialists. "I am myself an optimist," says the chief author, and, he might have added, an enthusiast; and there can be no doubt that this optimistic ardor in his make-up is responsible for the great and blessed work which this remarkable man has accomplished in the bleak northland, and for the warm admiration, and even affection, which he has inspired even in those who have never set eyes upon him. Dr. Grenfell has made many efforts to interest the world in Labrador and its people, with the laudable ambition of furthering his ambitions there, but none so elaborate and, it is to be hoped, so efficacious as this book, which may be called a description of Labrador, geological, historical, ethnographical, physical, faunal, commercial, and social. Though written for the most part in popular style, it is very complete, some of the chapters, such as those on the Indians, by William B. Cabot, and the flora, by E. B. Delabarre, being especially thorough. The other scientific portions are also excellent. The volume, while making use of statistics only to a reasonable degree, contains about all that any inquirer needs to know. The compiler's intention has been to make it practical and informative, and it contains no sermons. Neither is Dr. Grenfell a sentimentalist, much less a mollycoddle. He is an enthusiastic though sportsmanlike and humane fisherman and hunter, and takes one occasion to poke fun at the tender-hearted lover of the mild-eyed seal, which eats its prey alive, and will often leave it to die a lingering death after taking a single bite out of it. Needless to say, Dr. Grenfell is a firm believer in the future of Labrador, in its eventual complete reclamation to the uses of mankind; for "the hand of man has grappled with harder problems than this presents." He draws comfort and conviction from the accomplishments of Burbank, from Newell's irrigation of the deserts of the West, from the damming of the Nile, and he looks forward to a blooming and a productive Labrador. The book is both interesting and inspiring. It is profusely illustrated and contains a good index.

James Brown Scott, who was American technical delegate at the second Peace Conference, follows up his two heavy volumes on the Conferences of 1899 and 1907 and the supplementary volume of texts, with a compilation of the addresses delivered at the second Conference by the American delegates, Mr. Choate, Gen. Porter, and the author. On the question of the establishment of a permanent court of arbitral justice, Mr. Choate spoke with admirable force and conviction. Mr. Scott drew up the report laid by the special examining commission before the plenary conference. If the court of arbitral justice came out of the Conference an elaborate mechanical scheme, completely without life, an august tribunal without judges, it was not the fault of our dele-

gates, who did their best to appease the fears and prejudices of the small nations on whose opposition the plan was shipwrecked. The volume is published for the International School of Peace by Ginn & Co.

A new volume, the ninth, of the Calendars of Letter Books of the City of London, edited by Dr. R. R. Sharpe, Records Clerk to the Corporation, has recently been issued. It covers the period from 1400 to 1422, the reigns of Henry IV and Henry V, and, while less important than its immediate predecessor for the history of London, contains a valuable record of mediæval municipal life, chiefly social and economic in character. Dr. Sharpe has not printed in any of the volumes the Latin originals as they stand in the Letter Books, but has furnished a continuous digest in modern English, with the dates filled in throughout (a task of great difficulty), with short notes added, where needful, and with an admirable preface calling attention to the significance of the events recorded. In the period embraced by the volume the city underwent no such constitutional dissensions and changes as were met with in the previous volume, consequently the reader's attention is drawn rather to national than to municipal affairs—the renewal of the war with France, rebellion in Scotland and Wales, and the extinguishing of Lollardry. We are impressed with the large part played by the men of London in the affairs of the country, particularly such as concern the King and Parliament on the financial side, and are interested in one or two minor details contributory to precision in knowledge, such as the exact day and hour when Henry IV died—between seven and eight o'clock on the morning of March 20—a fact hitherto unknown to historians. Though Richard Whittington, thrice Mayor of London, appears frequently in these pages, very little is given that adds to our knowledge of this hero of childhood's romance.

"Esthetics" (Holt), by Kate Gordon, is a well-arranged college text-book, which deals chiefly with the principles of the several arts. It is written with spirit, and, with a few exceptions—Benedetto Croce's stimulating work has been overlooked—is quite abreast of modern research. For abridging the psychological introduction there may be sound pedagogical reasons, but, because the subjective bases of beauty are summarily treated, the foundation of the edifice is insecure. The author has a leaning towards those theories of motor participation which are characteristic of the French school, and of William James's analysis. She finds, with her master, Professor Dewey, that an emotion is essentially a consciousness of conflicting impulses which have been induced by bodily changes, but nowhere clearly discriminates æsthetic from non-æsthetic emotions. Here Croce's dogma that æsthetic expression is a necessary stage in intellection, the æsthetic moment being merely a suspension—a conscious lingering over what is usually a momentary and half-automatic experience—would have helped out her psychology. The succinct account of the principles of the arts is well done, though naturally much that is highly contentious is presented as if it were assured. The importance of the sense of similitude as the basis of artistic creation is exaggerated. A sense of differences is only less necessary. In the chapter on color one surmises some rather futile laboratory experiments. Except to a bull or a bullfrog, unapplied color has practically no æsthetic value, whatever laboratory subjects, under the need of saying something, may imply to the contrary. The art value of the epic is underestimated, on the warranty of Poe's dislike of the long poem. That certain artificial epics, or perhaps romances is the better word, are enjoyed only in spots, is possibly true. To fail to perceive the cumulative and slowly gathered force of the great traditional narratives argues a very modern and rather limited taste. A similar philistinism affects the treatment of the poetic drama. But one can understand how a young writer, who may never have heard a competent recitation of dramatic verse, should think that the poetry counts only in flagrant purple patches. Generally, this book is marked by sound scholarship and good sense. For classes or for unattached beginners it may safely be recommended.

"The Problem of Evil, a Criticism of the Augustinian Point of View," by Marion Le Roy Burton, president-elect of Smith College, is a careful and creditable piece of work upon a threadbare subject. It was written while Dr. Burton was still a graduate student, and its publication in book form calls for no extended notice. It is accurate and sound, but contributes nothing new or especially significant. (The Open Court Co.)

Dr. Louis Klopsch, proprietor and editor of the *Christian Herald*, and widely known as an organizer of famine relief funds, died in New York on March 7, at the age of fifty-seven. He was a native of Germany.

Dr. Gustav Liebermann, a Hebrew writer on theology, and a contributor of articles on literary topics to American and foreign magazines, died on February 28 in this city, at the Lebanon Hospital, of which he was a founder. He was born in Austria in 1854, graduated at the University of Budapest, and came to this country about thirty-four years ago.

Hans Jaeger, the Norwegian author, whose novel, "Bohemian Life in Christiania," aroused much comment about twenty-five years ago, and caused his imprisonment for two months, died recently.

Prof. Erich Haupt, the German theologian, died recently at Halle, at the age of sixty-eight. He had been professor of New Testament exegesis at Greifswald, and (since 1888) at Halle. His publications include "Der erste Brief des Johannes," "Die alttestamentlichen Zitate in den vier Evangelien," "Die Kirche und die akademische Lehrfreiheit," "Die Bedeutung der Heiligen Schrift für den evangelischen Christen," and "Die eschatologischen Aussagen Jesu in den synoptischen Evangelien." He was editor of the *Deutsch-Evangelischen Blätter*.

Hermann Heiberg, the German novelist, died recently, at the age of sixty-nine. He was a native of Schleswig, and had been the director of the *Norddeutsche Allgemeine Zeitung*, and a representative of the *Hamburger Correspondent*, and of the *Gartenlaube*. His long list of works includes "Fluch der Schönheit," "Die goldene Schlange," "Apotheke Heinrich," "Norddeutsche Menschen," "Ein Mann," "Zwei Frauen," "Heimat," and "Die schwarze Marit." His collected works, in eighteen volumes, were published at Leipzig in 1894-96.

Tal Talson Melstad, the Icelandic historian, died recently at Reykjavik, at the great age of ninety-seven. He had published a "History of the North."

Science.

Diamonds. By Sir William Crookes, LL.D., D.Sc., F.R.S. New York: Harper & Bros. 75 cents net.

The diamond, the hardest of all gems, has always had a fascination for the great physicists, and notably for Robert Boyle, Sir David Brewster, and Dr. Henry Draper. In the seventeenth century Robert Boyle published a volume on precious stones, and many of his observations on the diamond may still be read with interest. In the past century, Sir David Brewster and Dr. Henry Draper both published works on the properties peculiar to the diamond, and now we have, from the pen of Sir William Crookes, a valuable monograph on this subject. This distinguished physicist has made many observations on the diamond, and was invited by the British Association, in the year 1905, to deliver a lecture at Kimberley, where the association held its annual meeting, the sum of £600 being devoted to the lecture, while more than this amount was expended for the various materials employed. So keen was the demand for seats that the tickets which fell into the hands of speculators sold readily at £5 each, and it was found necessary to repeat the lecture.

This lecture suggested the present volume, which contains not only many original and valuable contributions to science, but many additional facts concerning the origin of the diamond, its occurrence in Cape Colony, Kimberley, etc., the work in the great mines, and also discussions of occurrences in India, Brazil, and Arkansas. An interesting fact brought out by the author's close study of the crystals from different mines is that the product of each mine has a distinctive character. This is so marked that a trained observer can tell from which particular locality a parcel of stones has been obtained. To this rule there are but very few exceptions.

On page 98 an effect of the action of radiant matter upon the diamond is noted. When a diamond is subjected to the bombardment of the electrons in a radiant-matter tube, the surface of the stones, in a short time, becomes black. Both Sir William Crookes and Henri Moissan have shown that this superficial coating is graphite, produced by the fusion of the outermost layer of the diamond; and it has been estimated that a temperature of 3,600 degrees centi-

grade was generated by the attack of the electrons, although this intense heat was so rapidly diffused through the body of the crystal that it could not be noticed on the tube.

That an element of truth may exist even in an erroneous theory is an undoubted fact. An illustration of this is offered by the statement of Pliny that if the diamond were laid upon an anvil and struck with a hammer, both hammer and anvil would be fractured, but the diamond would remain unharmed. This story, offered on hearsay evidence by Pliny, and servilely copied from him by all mediæval writers, is, of course, quite incorrect; the facile cleavage of the diamond would cause it to break up into a number of pieces if treated in this way. And yet Pliny would have seen a proof of the essential truth of his account, could he have assisted at an experiment described by Sir William Crookes (p. 92):

> The intense hardness of the diamond can be illustrated by the following experiment: On the flattened apex of a conical block of steel place a diamond, and upon it bring down a second cone of steel. On forcing together the two steel cones by hydraulic pressure the stone is squeezed into the steel blocks without injuring it in the slightest degree.

Of the questioned occurrence of diamonds in the meteorite of Cañon Diablo, in Arizona, the writer says (p. 139):

> The mineral peridot is a constant extra-terrestrial visitor, present in most meteorites. And yet no one doubts that peridot is also a true constituent of rocks formed on this earth. The spectroscope reveals that the elementary composition of the stars and the earth are pretty much the same; and the spectroscope also shows that meteorites have as much of earth as of heaven in their composition. Indeed, not only are the selfsame elements present in meteorites, but they are combined in the same way to form the same minerals as in the crust of the earth.

These considerations, and the fact that iron at a high temperature and subjected to great pressure may be called "the long-sought solvent for carbon," leads the author to assert that the evidence afforded by the Cañon Diablo and other meteorites proves "that on more than one occasion a meteorite freighted with jewels has fallen as a star from the sky."

Drama.

Aristophanes and the Political Parties at Athens. By Maurice Croiset. Translated by James Loeb. New York: The Macmillan Co. $2 net.

When Hazlitt undertook to write on comedy in general, he had the singular honesty to say that, knowing little of Aristophanes, he would say little, and when he adds that, for the same reason, he will pass over Lucian, one feels that this will never do. George Meredith was better equipped. After reading Croiset's careful and scholarly discussion of the political and social views of Aristophanes in which a thesis is maintained and illustrated by analyses of the eleven extant plays (he wrote forty), it is refreshing to turn to "The Idea of Comedy" and regain the Meredithian standpoint. "There is an Idea in his Comedies," says Meredith; "it is the Idea of good citizenship." Aristophanes's good citizen will, no doubt, be one who frowns on all novelties, partly because it is the nature of the comic spirit to be conservative, to praise the old, to fix the gaze on Marathon and Salamis, and make game of recent strategy at Sphacteria, partly because Aristophanes feared the excesses of the Ionian temperament. He saw these unstable Athenians demanding empire, but refusing to pay the price for it, except spasmodically; already too ingenious, they were being trained by the sophists into dangerous habits of analysis, while they were flattered by demagogues into keeping up a ruinous war. Like Plato, Aristophanes would have had them choose in education and literature the more austere and less fascinating, and in politics the less individualistic, the old and tried. But his first duty was to make them laugh. A playwright with his talent for mordant raillery was not likely to refrain from caricature whether of a professor who was teaching the young to be too clever, like Socrates, or of Euripides, with his sentimental tragedy and his new music, or of the socialistic woman in politics, like Praxagora, carrying out in public life that feminine ideal of simply making everybody comfortable, which every man, in his heart, thinks should be limited to the home. There is always a ridiculous side to a new fashion, and it is a question beside the mark whether Aristophanes genuinely hated, as Browning thought, almost everything that makes the Young Athenian so interesting to us.

What is still less easy to decide is whether the tendency that he ridiculed was associated in his mind with the oligarchs or the democrats, or with neither party in particular. Did he desire to pull down democracy or to reform it, since we must admit that he aimed at something more than merely entertaining the Athenians at their own expense? Was he, as Couat thinks, the paid voice of the aristocracy; did he in all his plays carry on a campaign in its behalf, lament its fall, and prepare its revenge? Or was he throughout his career seriously devoted to the interests of the rural middle-class? The latter is the theory of Croiset, whose book has been translated by Mr. Loeb.

Here, then, are two French scholars of about equal distinction, totally at variance as to the political meaning of the plays of Aristophanes. The fact is that to search for consistency in the utterances of the comic spirit, except perhaps the consistency of commonsense, will always end in this deadlock; and in the exuberant abundance of an Aristophanes you are pretty likely to find the personal creed for which you are looking. To give one or two examples: There are good critics who see Alcibiades under the mask of Peisthetærus in the "Birds"; Croiset and Couat agree that the play is pure fantasy. Busolt can see in the "Thesmophoriazusæ" the "signs of coming storm at Athens"; Croiset cannot imagine to what Busolt refers. For Couat, the "Knights," in which Demos appears as an imbecile, is a sort of political manifesto, like "The Englishman's Home," and the picture of his sudden conversion in the *dénouement* is merely the poet, like Rosebery, safeguarding his retreat. For Croiset, that conversion is the real point of the play, and its meaning is that nothing can save Athens but a return to the agricultural life. At this rate one might say he was in favor of female suffrage because it is a woman in politics, Lysistrata, whom he chooses to utter his most sensible and most appealing message to Sparta and Athens in the name of Hellenic brotherhood. This sort of treatment reminds one of a recent writer who sees everywhere in the story of fourth-century Athens the growing influence of malaria, even in the improvement in the position of women, whom their husbands now began to love because they nursed them so well. Croiset marshals his arguments better than Couat, and is therefore more convincing to read. But the strength of French criticism lies in this: that a Frenchman seldom suppresses what is against his theory, and in their summing up both Couat and Croiset rise above their theses and silence your misgivings by their generous allowances to the comic spirit. Both books may be read with profit as intelligent studies of Athenian life.

Mr. Loeb's translation is well done, and, like his translation of Decharme's "Euripides," should be of use to many English readers. There are a few misprints, such as *Archarnians* (p. 54), "Hypponicus" (p. 117), and *Greichen* (p. 172). One is grateful for the exhaustive index, which was lacking in the original, and for the introduction by Prof. John Williams White.

John Galsworthy's latest play, "Justice," the first production in Charles Frohman's new Repertory Theatre in London, is a modern, realistic tragedy of the most uncompromising sort. In effect, it is a powerful protest against the application of identical methods of punitive justice to offenders of every degree. The story is the simplest imaginable. A lawyer's clerk,

hitherto innocent and harmless, in sheer desperation, at the appeal of a woman whom he loves, to save her from the brutality of a drunken husband, forges a small check. He is promptly arrested and tried, the scene in court—very grim and exact—being intended to show how utterly indifferent, in the presence of hard facts, a British court may be to comparatively valid pleas in extenuation. The clerk is sent to prison and the third act shows a victim of melancholia—on the verge of actual insanity—in his solitary cell. In the final act he is free only to find that the woman, for whom he had suffered, has been driven by poverty into the arms of her employer. In the vain effort to get work he writes a false reference for character, and, being arrested, commits suicide rather than go to prison again.

The first series of John S. Farmer's Tudor Facsimile Texts is now completed, and consists of thirty-eight volumes at 17s. 6d. each, one double volume at 42s. net, and four double volumes at 35s. net each; total forty-three volumes at £42 7s. net. These have been noticed in the *Nation* as they appeared. Mr. Farmer now announces that he has severed his connection with the publishers, the Messrs. Jack, and will as his own publisher bring out a second series of volumes similar to the first, beginning with "Sir Thomas More" (Harl. MS. 7368, c. 1590), "Gammer Gurton's Needle" (c. 1551), "Edward III" (1596), and "The Yorkshire Tragedy" (1608), which are now, or soon will be, ready. As in the earlier series, 125 copies only of each volume are printed. We need scarcely emphasize again the value of these handsome photographic reproductions for minute students of the English drama. Subscriptions can be sent through any regular book agency, or directly to the editor at Little Missenden, Bucks, England.

Sarah Bernhardt presented in Paris on March 2 Jean Richepin's French rendering of a four-act tragedy, "La Beffa," by Sembenelli, a young Italian dramatist. Mme. Bernhardt acted, very effectively, it is said, the male rôle of Giannetto Malespina, a cruel and treacherous Florentine nobleman, combining the characteristics of Tiago and Lorenzaccio.

Louis James, the American actor, died on March 5, in his dressing room in a theatre in Helena, Mont. He was born in Illinois in 1842, and in 1863 made his first appearance on the stage under the management of McAuley in Louisville. Then for six years he played with the stock company of the Arch Street Theatre, Philadelphia, under the direction of Mrs. John Drew. In 1871 he joined Augustin Daly, with whose companies he played in many characters, among them Doricourt, Joseph Surface, Young Marlow, and Bill Sykes. In Joseph Surface he was particularly successful, giving the character a blend of cynical humor, external polish, and bland hypocrisy which was exactly appropriate to it. For five years he acted with Lawrence Barrett, which whom he was especially effective in the rôle of Beppo the jester, in "Francesca da Rimini." In 1893, he appeared as a star in "The Lion's Mouth," and then joined Frederick Warde, with whom he played for several seasons in Shakesperian and other legitimate drama, acting both tragic and comic parts with considerable success. When this partnership was dissolved, he took the field alone. He won popular favor in such famous and diverse parts as Virginius, Falstaff, Richelieu, Ingomar, and Shylock. His latest impersonation was that of Peer Gynt. James was competent in comedy, and, at his best, a fine actor, but he never quite fulfilled the promise of his early youth.

Moses Horowitz, who wrote many Yiddish plays which had been produced in New York East Side theatres, died in this city on March 4, at the age of seventy-six. He was born in Bucharest, Rumania, and was well known as a theatrical manager in Austria before he came to this country, in 1882. "Ben Hador," produced six years ago, was the most successful of his plays. Five years ago a venture to produce grand opera in Yiddish at the Windsor Theatre consumed all of Horowitz's savings, and when he was stricken with paralysis following his misfortunes, his friends provided for his care in the Montefiore Home.

Music.

THE CHOPIN CENTENARY.

PARIS, February 25.

From the many notable voices that have been celebrating in France the hundredth anniversary of Chopin's birth, there have come a few words of lasting interest. Charles Widor gives an anecdote significant in nineteenth-century musical history, and an authentic observation of Chopin's keeping of time in playing his own pieces.

In 1832 Chopin came to Paris from Vienna and took lodgings. Next door there was a piano going, played by no mean hand. He learned that his neighbor, a tall, thin, long-haired Frenchman of about his own age, was a first-prize man of the Conservatoire. It was Ambroise Thomas; and the two were soon fast friends. Early one morning, Chopin rang at Thomas's door. "Get up! At eight o'clock the Société des Concerts is going to read a composition of a young German who has come to me with great recommendations." The young German was Mendelssohn, and his composition was the overture of the "Midsummer Night's Dream." The orchestra showed only too plainly its indifference to the new music. Chopin was aflame. "Think of the poetry of it, the sure technique, the invention—and those performers who understand nothing and feel nothing!" So the two friends did their best to comfort the unappreciated German and took him off to breakfast.

Ambroise Thomas had sixteen years of Chopin's intimacy, saw his work grow, and knew it by heart; and he gave this authentic direction about playing it. Chopin played rigorously in time. Whatever liberties his right hand might be taking, his left kept on scanning the time as exactly as a pendulum. Amateurs have come to believe that Chopin's style was to play without measure, always more or less in *tempo rubato*, as if his fancy were having hysterics. Artists have stuck to the true, wholesome tradition. Francis Planté wagered lately that he would play one of the last Barcarolles and not be caught in a single fault of isochronism in the bass, while keeping to his usual free execution. He seemed to pay no attention to the metronome, but his basses fell with the mathematical regularity of a chronometer. Planté is now past seventy; the younger musicians were glad to have lost their bet for the lesson. Ambroise Thomas also maintained that Chopin was not nearly so much interested in the effects as in the charm of sound and precision of the rhythm. He played clearly, bringing out the exact value of each detail in making up the whole. His *legato* and limpid polyphony have not been rivalled, while he was the soul of probity in the interpretation of the musical text.

Chopin's true place in the history of piano music is curiously appreciated on this occasion by well-known composers, particularly of the younger school. Théodore Dubois, who was a Grand Prix de Rome of the Conservatoire all but fifty years ago: "Chopin and Schumann entirely renewed the manner of writing music for the piano." Vincent D'Indy: "All I can say is that Chopin seems to me an improviser (unfortunately) of genius (fortunately)." Claude Debussy: "I almost loved Chopin when I began loving music—and I have continued." Alfred Bruneau: "Under the light arabesques with which Chopin the pianist adorned the grave melodies of Chopin the musician, we feel there is a free heart uttering itself as no other ever did before." Gaston Salayre bears witness that he heard Liszt play the chief works of Chopin—"and Liszt admired them profoundly. Is there any more valuable homage to Chopin's memory?" Camille Erlanger: "Chopin's influence is flagrant in ultra-modern music." And Fernand Le Borne: "Chopin for the piano was what the Colossus of Bayreuth was for the orchestra."

A TCHAIKOVSKY OPERA.

Inasmuch as the most popular of all symphonic works during the last decade has been the "Pathétique" of Tchaikovsky, it seems odd that until last Saturday no attempt should have been made to produce one of his operas in this country. There are eight of them that are more or less familiar in Russia: "The Oprichnik," "Vakoula the Smith," "Eugene Oniegin," "The Maid of Orleans," "Mazeppa," "The Enchantress," "Pique Dame," "Iolanthe." Two of these, "Eugene Oniegin," and "Pique Dame," are also heard occasionally in Germany; but in this city we have never got a nearer glimpse of the operatic side of Russia's greatest composer than the production of "Eugene Oniegin," in concert form, by Walter Damrosch, a few years ago. Altogether, apart from the intrinsic value of the

opera. Saturday's production of "Pique Dame" at the Metropolitan was therefore a notable event. Gustav Mahler conducted the performance, the opera was beautifully staged, and the cast included Emmy Destinn, Anna Meitschik, Florence Wickham, Alma Gluck, Leo Slezak, Adamo Didur, Adolf Mühlmann, John Forsell. The reception of the novelty (which was written in 1890) was favorable, but not enthusiastic. It is not likely that many of those who heard it shared the opinion of the composer, expressed to his brother Modeste (who is responsible for the libretto), that "Pique Dame" is a masterpiece.

"Pique Dame" (in English, "Queen of Spades") is the name of an aged countess on whom, in her youth, famous men had danced attendance, and who had also had such great luck at the gaming-tables that she was reputed the possessor of a secret combination of cards capable of winning every game. A young St. Petersburg officer named Hermann resolves to find out this secret, and thus win the money he needs to elope with Liza, the countess's granddaughter. Liza is engaged to Prince Jeletsky, but favors Hermann. She gives him the keys to her own apartments and those of the countess, before whom he appears in the night, and, pistol in hand, demands the secret, so frightening her that she expires. Subsequently, in his barracks, her ghost appears to him, showing him the three cards. Liza waits near the Winter Canal, ready to fly with him. But when he comes, he raves about the cards, ignores her, and she, in despair, after he has left, throws herself into the Neva. In the last scene we see Hermann at the gambling-tables testing his secret. On the first two cards shown him by the ghost, he wins; but when he comes to the third, it proves to be, instead of the expected ace, the queen of spades. In a fit of despair and madness he stabs himself.

Tchaikovsky composed the music to this grewsome libretto of his brother, as he wrote to him, "with pleasure and self-oblivion"; yet it does not show his genius at its best. There is a great deal of operatic small talk accompanying the dialogue, and there are no grand climaxes to atone for it, such as his purely orchestral works contain in abundance. He himself was particularly pleased with the scene in which Hermann visits the old Queen of Spades and causes her death; and here the music certainly is inspired, and equal in grewsomeness to the dramatic situation. The storm music in the first act is not particularly effective. Lyrically, the loveliest number is a duo in the second act. Charming also is the old pastoral ballet in the same act, with music *à la Mozart*. Tchaikovsky adored Mozart and despised Wagner. His chances of success as an opera composer—like those of Rubinstein, who held the same attitude—would have been much greater had he also adored Wagner, and learned from him the secret of constructing a successful modern opera. Tolstoi advised him strongly to give up the pursuit of theatrical success, because of "the complete falseness of opera." Referring to this in a letter, Tchaikovsky adds: "I, too, when I am writing an opera, feel so constrained and fettered that I often think I will never compose another." It would have been well had he followed this inclination, and given all his time to purely instrumental music.

Art.

"Old English Colour Prints," by Malcolm C. Salaman, is one of those fully illustrated special numbers with which the *International Studio* occasionally favors its readers. The appeal of these tinted engravings is æsthetically rather small. The English artisan engravers went in for the obviously engaging qualities, and never attained that thoughtful beauty of tone which makes a print by Lavreince an authentic work of art. Any powdery charm in the originals is much attenuated in the forty fac-similes which illustrate this number. The appeal is to the incipient collector who would familiarize himself with the most noted subjects. Mr. Salaman's observation on the limited taste of collectors of these trifles is worth repeating. "It is," he says, "a curious and noteworthy fact that the collector of old English color-prints has rarely, if ever, any sympathy with modern art, however fine, however beautiful."

Many students know the Art Museum of the University of Oxford for its drawings by Leonardo, Michelangelo, and Raphael; a smaller class may be acquainted with the Arundel marbles, the Renaissance bronzes of the Fortnum collection, or the small but fine group of paintings by the English Pre-Raphaelites. A handbook just issued, "Ashmolean Museum: Summary Guide" (Oxford: Printed for The Visitors), reveals riches which only the inner circle will have known. In Ægean and Hittite archæology the collection of this museum, comprising fac-similes as well as originals, is elsewhere unequalled. Most readers, then, will turn first to the section on Ægean (sometimes called more restrictedly Minoan) antiquities, which is written by the keeper of the museum, the well-known Cretan excavator, D. G. Hogarth. These pages contain not merely a reasoned inventory of the galleries, but also give a succinct account of the nature of Ægean art, so lately recovered from Crete, and of its importance as the forerunner of Hellenic civilization. Since the museum is also rich in Egyptian, especially in Pre-dynastic objects, and contains, aside from the Hittite collection, numbers of Cypriote, Phœnician, Babylonian, and Cycladic exhibits, its importance for the study of the primitive art of the eastern Mediterranean is obvious. This little pocket guide has been written by half a dozen specialists, comprising or allied with the staff of the museum, and revised by the keeper. It is primarily intended for lay visitors, but will be useful to all students of the history of art.

The second volume of Lewis F. Day's "Nature and Ornament" (Scribner importation) bears the subtitle: "Ornament, the Finished Product of Design." After establishing the main classification of ornament into naturalistic, conventional, and abstract, he shows by historic examples typical adaptations of natural forms—flowers, vines, trees, animal forms, grotesques. Against naturalism the author sets himself firmly. It seems to us that the geometrical approach to decorative design is the sound one. By dispensing with nature for a time, the beginner learns to use her only when she clearly serves his turn. Naturally Mr. Day's subject, being at least half nature, forbade him to suggest a method of attack with which we fancy he is really in sympathy. How much we need to reinvigorate modern ornament by reference to sturdy geometrical forms is shown in all the examples of modern English design, including the author's. We find many beautiful and intelligent simplifications of natural forms, in detail, but almost no patterns that have consistence as wholes. Beyond a diaper or all-over pattern, the current work is painfully lacking in character. Mr. Day's plea for a balance between independent study of nature and consultation of historical ornament seems to us eminently sound. His pages overflow with well-chosen examples of fine decoration from every field and era of art. Merely as a repertory this book will be useful to practical designers; to beginners it offers valuable direction conveyed with much good sense and geniality.

A useful abridgment of H. M. Cundall's revision of William Chaffers's "Keramic Gallery" appears in the "Collectors' Handbook to Keramics of the Renaissance and Modern Periods," which Charles Scribner's Sons have imported. The merits and limitations of the larger book have already been set forth in these columns (June 18, 1908). From this handbook some of the larger and many of the smaller illustrations have been omitted, but enough are retained to represent each important type of pottery down to about 1880. The text, while necessarily much abbreviated, tells a continuous story. For any collector who does not care to purchase the more expensive and sumptuous work this is an excellent substitute.

The album-like form of "Great Portraits, Women" and "Great Portraits, Children" (Bates & Guild Co.) might lead a casual observer to neglect the text. This would be a mistake, for it is written by the well-known Boston painter and art critic, Philip L. Hale, and it contains many sensible and shrewd observations on portraiture in general. Pure gold is the comment on psychology in portraiture. Says Mr. Hale: "The fact is the term is used very loosely. Some painters study the forms more closely than others, and they are called psychologists. The most that a painter can do is to copy the forms; and if he does it faithfully a something beyond his understanding is now and then created." On minor matters there are grounds of difference with our author. Portraiture does not hang on the development of oil technic. Some of the finest heads we have are in tempera and even in fresco. Nor were incidental portraits of donors rare in Italy before Titian's Pesaro Madonna. In Mantegna and his Northern imitators the practice was common a generation before Titian's activity, while in Florentine frescoes, portraiture of a masterly quality lags only a bare ten years behind the Van Eycks. Æsthetically, one might quarrel with the dictum that, for painting purposes, a woman should be very young or very old. Excluding the moderns, who have almost specialized on the woman of thirty years, Dürer, Holbein, Lotto, to go no further, afford memorable instances to the contrary. A fastidious reader will regret the oversprinkling of the text with French terms. One more minor cavil before we have done with these interesting essays: the beautiful marble bust in the Louvre set down here as of unknown au-

thorship has long since been identified as a Francesco Laurana, while the little St. John, in gray stone, of the Bargello, is not by Donatello, but by an early copyist of Desiderio da Settignano. The illustrations of these two volumes range from Leonardo da Vinci to Sir Thomas Lawrence, and are generally well reproduced.

The death is announced of Johann Börjeson, the gifted Swedish sculptor. He was born in Holland in 1835. His principal works include Die Kegelspieler, in the Gothenburg Museum; Die Fischerknaben, in the National Museum at Stockholm, and a colossal statue of the poet Holberg, for the city of Bergen.

Finance.

A CHAPTER IN STEEL TRUST FINANCE.

Last week's resignation from the Steel Corporation's directory, of the last representative of the Rockefeller interest left in its membership, and the reason formally assigned for it, excited widespread comment. From the hour of the company's organization, in March, 1901, public attention has converged incessantly on the question, how many shares did the largest "insiders" hold. At the start, the facts were roughly known. Out of the $1,018,000,000 United States Steel stock issued in March, 1901, $188,500,000 was assigned to the fifty or so junior holders of the Carnegie Steel Company; Carnegie himself having received only bonds. The numerous shareholders in the seven or eight less important steel manufacturing combinations which were taken in, received something over $600,000,000 in the new United States Steel shares.

There remained one very large individual allotment, issued for what an official circular described as "the acquisition of more than 85 per cent. of the stock of the Lake Superior Consolidated Iron Mines, embracing therein the interests of John D. Rockefeller." This 85 per cent. interest footed up $25,000,000; it was exchanged for 270 per cent. in the Steel Corporation's new shares; so that the initial "Rockefeller interest" was a little above $64,000,000. So far as documentary evidence is available, this was the largest single holding of the Steel shares. The next largest, that of one of the Carnegie partners, was a trifle above $50,000,000.

Just a year afterward, another peep at the inside facts became possible. Under the law, the large Steel investors were compelled to file at Trenton, with a statement of their several holdings, their assents to the plan for converting $200,000,000 Steel preferred shares into bonds. It was not possible to say exactly to what extent such "inside interests" signed for the whole of their holdings, and to just what extent they allowed brokers or agents to sign for them. But, taking the declarations as they stood, the list showed that the Rockefeller holdings still made up one of the three largest individual blocks—slightly exceeded, then, by the holdings signed for respectively by Messrs. Phipps and Frick.

The withdrawal of the younger Rockefeller from the directorate, last week, would perhaps have attracted no unusual notice—especially in view of the simultaneous news of his proposed work in the new "Rockefeller Foundation"—but for the official explanation given out by the Chairman of the Board. It was:

> Mr. Rockefeller, jr., states that the only reason for his resignation is that the holdings of stock in the company by members of his family are not sufficiently large to justify his giving any time or attention to the affairs of the corporation.

This was necessarily tantamount to saying that the $64,000,000 Rockefeller interest in the Steel Corporation had been sold out.

When was this done, and why? John D. Rockefeller, although the largest individual investor, personally a director in the company at the start, and represented on the board ever since, until last week, did not cut any figure in the company's earlier history. The "Morgan control," no doubt through the coöperation of the other large single blocks of holdings, was unquestioned. The Rockefeller interests raised no question, during 1901 and 1902, over the two very much-discussed fiscal moves—the 4 per cent. initial dividend on "Steel common," and the plan to turn $200,000,000 preferred stock into bonds.

In 1903 came a change of position in the field of high finance. Some very large holders of the Steel shares had engaged in other and far more perilous promoting experiments. The projects came to grief; the hour arrived of tightening credit and undigested securities. Many of these financiers had to throw their Steel shares overboard; the price, which had risen to 55 in 1901, fell by March, 1904, to 8⅜. But it was well understood in Wall Street that the "Standard Oil interests" had put their own house in order before the storm began, and it was inferred that, around the lower prices, the Rockefellers were buying the Steel shares with which the other interests were forced to part. Towards the close of 1903, when the Stock Exchange operations of the syndicate which had engaged to deliver preferred stock in exchange for bonds were exciting angry public protest, a halt was suddenly called on the whole proceeding. With only three-fourths of the allotted $200,000,000 thus exchanged, the "stock conversion" stopped. Rightly or wrongly, Wall Street ascribed the veto on it to the Rockefeller interests, backed by their increased holdings of the Steel shares.

Whether because of this new interest or not, but at any rate with its approval, three years of very conservative management ensued. The dividend on Steel common was neither earned nor paid in 1904; but even when earnings improved again, it was nearly two years before dividends were resumed, and the rate then fixed was only half what it had been in 1901. Two to five times as much as formerly was appropriated every year for improvement and construction. This lasted up to the panic

Financial.

6% Reclamation Bonds

Secured by a Thousand Farms

The trend of investment among our thousands of customers is toward Reclamation bonds. With us, these bonds are now outselling all other bonds combined.

They are secured by first liens on good farm land—sometimes a thousand farms. And this land reclaimed by drainage or irrigation is the most fertile farm land in America.

The bonded indebtedness is conservative, rarely exceeding one-fourth the land's value. And, the bonds being serial, this indebtedness is rapidly reduced.

As additional security, we have a first mortgage on all the property of a corporation in which the investment is sometimes twice the bond issue. Thus we combine corporate responsibility with farm lien security.

Some of these bonds are "Carey Act" bonds, where the State supervises the project. Some are municipal securities, issued by organized districts. Such bonds form a tax lien on the district.

The interest rate is six per cent.—a liberal rate for high grade farm lien securities. The bonds are for $100, $500 and $1,000, so they appeal to small investors and large. And the differing maturities enable one to make short-time or long-time investments.

For all of these reasons, rightly selected Reclamation bonds have come into great popularity.

16 Years' Experience

During the past 16 years we have sold 78 separate issues of Reclamation bonds, all based on farm liens. Not a dollar of loss has resulted to any investor.

Our position in this field gives us the pick of these projects. To investigate and supervise them, we employ the most competent engineers and attorneys. And an officer of our Company constantly resides in the irrigated sections, watching the projects we finance.

Every investor, small and large, should read our book on Irrigation bonds. Cut out this coupon as a reminder to send for it. (18)

932

of 1907, through which the Steel Corporation passed with less trouble than it experienced in 1903—a result unquestionably attributable to the wise husbanding of resources and building up of surplus during 1905, 1906, and the early months of 1907. When the panic came, Wall Street discovered an interesting fact. Certain of the "Standard Oil interests," though by no means all of them, were caught in the market as a result of their speculations of 1906, precisely as certain of their rivals had, in 1903, been involved because of 1902. There was also reason to believe that the people whose "Steel" they had bought, at the bargain prices of four years before, had prepared for 1907 as the "Standard Oil interests" themselves had prepared for 1903. There was apparently another extensive shifting of holdings, during the panic period, from one "inside interest" to another; the Stock Exchange asserted that virtual control had passed again into the hands which had relinquished it in 1903. Perhaps because this stock predominance was now recovered, restoration of the 4 per cent. common stock dividend, the very peculiar speculation in the stock, and its rise almost to par, made up the next chapter—that of 1909.

When, then, were the original Rockefeller holdings of "Steel" closed out? It has been shown that certain "Standard Oil interests" were engaged in forced liquidation during the panic. But that this hard-pressed group of financiers included the man who sold his Lake Superior property, in 1901, for $64,000,000 in the Steel shares, was never imagined for a moment. John D. Rockefeller, indeed, during the crisis of October, 1907, was busy advancing money to help out the hard-pressed trust companies. If he did not sell his "Steel" before the low prices of the panic, he is fairly certain not to have sold them until some time afterward. There are those who hazard the guess that, since retirement of the last Rockefeller director from the Steel Corporation's board was not announced until March, 1910, the closing-out process must have been effected in the last months of 1909, when the fiscal policies of 1905 and 1906 were changed, when dividends were twice increased in advance of resumption of construction appropriations, and when Steel common, in last autumn's excited speculation, rose to 94⅞.

A BOOK OF UNIQUE CHARM.
LITTLE BROTHER O' DREAMS
By ELAINE GOODALE EASTMAN.
"We are grateful for this unworldly little book with its naive and beautiful poems."—*Chicago Tribune.*
Attractively bound. $1 net. Postpaid, $1.07.

A History of Mediaeval Political Theory in the West
By R. W. CARLYLE, C.I.E., and A. J. CARLYLE, M.A.
To be in 3 volumes. 8vo. Each, $3.50 net.
Ready: **Vol. II. The Political Theory of the Roman Lawyers and Canonists in the Middle Ages up to 1250.**
Previously Issued: **Vol. I. A History of Political Theory from the Roman Lawyers of the Second Century to the Political Writers of the Ninth.**
The subject which is dealt with is strictly a history of theory, not of institutions. In the Middle Ages, as at other times, the two things are closely related to each other.
The work commences with the second century and comes down to the work of the political theorists of the sixteenth and early seventeenth centuries—that is, to the time when the specific characteristics of modern political theory began to take shape.
G. P. PUTNAM'S SONS, NEW YORK & LONDON

HUMAN ECONOMICS
Books I. and II.: Natural Economy, and Cosmopolitan Economy. By A. H. Gibson, F.C.A. 8vo, viii+406. $3.50 *net.*
In this work the author investigates the laws, both natural and human, controlling production and consumption, and, to that end, lays down new divisions of the Science of Economics, viz.: (1) Natural Economy, (2) Cosmopolitan Economy, (3) Communital Economy, (4) Individual Economy.

Winston Churchill's *new novel*

A Modern Chronicle

Mr. CHURCHILL'S new book is an interesting departure from his earlier novels in that they had each a man for its central figure, while this new one is distinctly the story of a girl. Imagine a girl of quite the finest American type, full of the beauty and the capacity for pleasure and pain which is the gift of southern birth; let her be reared as daughters of the South were trained in social charm twenty years ago; feed her dreams with traditions of a brilliant young father dead at almost the outset of a diplomatic career; give her a year of *the* fashionable boarding school and an ambitious marriage with "a Wall Street man." Then you will have the opening elements of *A Modern Chronicle*, which you will accept with a sigh of content as you settle yourself in comfort for an assured pleasure.

With full-page illustrations and drawings in the text. Cloth, $1.50. *Ready March 30.*

Mr. Winston Churchill's Novels

are among the most widely and most steadily sold of any in American fiction; their story interest is great and they have the added value of picturing truthfully American social life.

The Celebrity An Episode. *Cloth* $1.50.

"The most effervescent and refreshing bit of amusement possible . . . the most delightful surprise to the usual novel reader."—*New Orleans Times-Democrat.*

Richard Carvel *Illustrated by C. T. Chapman and Malcolm Fraser. Cloth,* $1.50.

A story of the first years of the American Revolution which many place alongside of Thackeray's "Virginians" for the interesting contrast of English and American points of view. "Moreover," as the *Review of Reviews* pointed out, "it is a tremendously good story."

The Crossing *Illustrated by Sydney Adamson and Lilian Bayliss. Cloth,* $1.50.

Revives the time when American energy was reaching for the South and West by the Cumberland Trail.

"It deals with one of the most fascinating dramas in the history of the world . . . and the novelist's rendering of that time is vivid and full of crisp description. . . . It is a vigorous, virile tale, full of movement, brimming with interest, hurrying from one stirring event to another."—*Brooklyn Eagle.*

The Crisis *Illustrated by Howard Chandler Christy. Cloth,* $1.50.

"Almost a dramatized chapter of Civil War history. Lincoln, Grant, and Sherman figure as characters in the story, and the art with which the great dramatic episode in our national history is treated reminds one of the famous battle pieces of Detaille, which, for all they are photographically realistic, are yet—unmistakably—art. Especially fine is the etching of Lincoln."—*Inter Ocean,* Chicago.

Coniston *Illustrated by Florence Scovel Shinn. Cloth,* $1.50.

Of this the London *Times* said: "Mr. Churchill has more of the epic quality than any writer now living . . . In 'Coniston' there is not a page without its interest, color, and significance, and all contributory to that unity of character and meaning which decides for a work of art the question of permanence."

Its period is between the present-day and the Civil-War generation which is made so real in "The Crisis."

Mr. Crewe's Career *Illustrated by Arthur I. Keller. Cloth,* $1.50.

"One of the best stories of American life ever written," pronounced the *New York Tribune,* referring to this modern story of the entrance of a practical man of high ideals into politics.

THE WHOLE SERIES IS EXCEPTIONALLY WORTH READING BY THOSE WHO CAN ENJOY AN EXCELLENT STORY THE BETTER FOR ITS BEING SOMETHING MORE THAN A MERE STORY

Memoirs of Henry Villard
Journalist and Financier
1835-1900
Two volumes, with Portraits and Maps, $5.00 *net*. Postage, 35 cents.
An autobiographical record of the varied and romantic career of the war journalist who subsequently became a power in the financial world, and carried the Northern Pacific Railroad to completion. Full of incident and valuable for its reminiscences of Lincoln and other prominent men of the time, as well as for its descriptions of important battles of the Civil War.
"A book of extraordinary interest. It is written with great ability, in a clear and flowing style; it details with perfect candor the incidents of a great career; it is an admirable report of great events, all of which the writer saw, and a large part of which (after 1870) he was; it exhibits the rise and growth of a rich and powerful personality and a character at once remarkable for its simplicity and its variety."—JOHN WHITE CHADWICK, in the *New York Times* Saturday Review.
"This posthumous autobiography of the late Henry Villard is a work of exceptional interest."—*Commercial and Financial Chronicle.*

BOSTON AND NEW YORK.

IMPORTANT BOOKS

PETRARCH'S LETTERS TO CLASSICAL AUTHORS. Translation and Commentary by MARIO E. COSENZA.

Professor Cosenza has preserved in his translation the air of delightful intimacy with which Petrarch addressed the classical authors. The great Italian knew the classics and the personalities back of them. In discussing the writings of Cicero, whom he accused of weakness of style and too free invective, he said: "I could not restrain myself, and, indignation prompting me, I wrote him as a friend of my years and time, regardless of the ages which separated us. Indeed, I wrote with a familiarity acquired through an intimate knowledge of the works of his genius, and I pointed out what it was that offended me in his writings." Professor Cosenza's translation is easy and graceful, and his notes supply the historical and literary data needed as a background to the text. The attractive little volume will win many new friends for Petrarch, and will be welcomed by those who already know his very human "Letters." 224 pages, 16mo, cloth; net $1.00, postpaid $1.09.

BOCCACCIO AND HIS IMITATORS. By FLORENCE N. JONES.

A collection of the titles of books founded on Boccaccio. The volume reports exhaustively on the authors who have taken much or little from the Decameron and brings together for the first time tangible evidence of the extent of Boccaccio's influence. The student who seeks to know how all literature has been affected by the work of this one man is able through this list to trace effectively his power. 46 pages, 8vo, paper; net 50 cents, postpaid 53 cents.

THE TREATMENT OF NATURE IN ENGLISH POETRY. By MYRA REYNOLDS.

When Dr. Johnson declared that "a man tired of London is tired of life," he epitomized the attitude of his age. The effect of this narrow artificiality on English poetry is ably described in this book. It is an exhaustive investigation into the works of the greater and lesser poets who wrote between the middle of the seventeenth and the end of the eighteenth centuries. The beginning and slow development of a real nature-sense are acutely traced and brought into relation with other activities of the time. The book is illustrated with copies of contemporary paintings which show more clearly than words the extent of the artists' feeling for nature. 410 pages, 8vo, cloth; net $2.50, postpaid $2.70.

SOURCE BOOK FOR SOCIAL ORIGINS: ETHNOLOGICAL MATERIALS, PSYCHOLOGICAL STANDPOINT, CLASSIFIED AND ANNOTATED BIBLIOGRAPHIES FOR THE INTERPRETATION OF SAVAGE SOCIETY. By WILLIAM I. THOMAS.

The papers forming the body of the book are by such eminent modern anthropologists as Boas, Tyler, Westermarck, Spencer and Gillen, Haddon, and Rivers. The author has an introductory chapter on the standpoint from which the materials are to be viewed, and critical comments are appended to each part. There are seven parts: (1) External Environment (Anthropogeography and Primitive Economics); (2) Primitive Mind and Education; (3) Early Marriage; (4) Invention and Technology; (5) Art, Ornament, and Decoration; (6) Magic, Religion, Ritual, and Ceremonial; (7) Social Organization, Morality, and the State. The extended Bibliographies form the chief feature of the book. 920 pages, 8vo, bound in buckram, gold stamped, sewn on tape; net $4.50, postpaid $4.77.

EZRA STUDIES. By CHARLES C. TORREY.

Professor Torrey's work in this literature began thirteen years ago with the publication of a pamphlet entitled *The Composition and Historical Value of Ezra-Nchemiah*, a treatise which was largely destructive of the accepted versions of the Ezra story, and which flatly contradicted most of the fundamental tenets of modern Old Testament science in its field. The author perceived that a thorough revision of the existing notions of the history of the Jewish people in the Persian period, their institutions and their religious ideas was inevitable, and began work on the series of studies which resulted in the present book, each chapter of which is constructive. 340 pages, 8vo, cloth: $1.50 net, $1.69 postpaid.

BIBLICAL IDEAS OF ATONEMENT: Their History and Significance. By ERNEST DEWITT BURTON, JOHN MERLIN POWIS SMITH, and GERALD BIRNEY SMITH.

This book sets forth the content of the biblical teachings upon the subject of Atonement, and suggests the point of view from which these conceptions may profitably be studied at the present day. The attitude assumed toward the records throughout is that of historical interpretation rather than of theological systematization. Consequently, the effort is to discover precisely what ideas of atonement are reflected by the biblical laws, institutions, and utterances. The authors employ the historical method throughout. To trace the history of an idea is to discover the forces that have coöperated to produce it and to transform it from age to age. The history of the idea is thus its best explanation. Yet as many readers will desire, not only a historical statement of what was believed and taught by the prophets and teachers of old, but also some indication of the value of those teachings for the present day, the closing section of the book (chap. xii, xiii) is devoted to this aspect of the matter. 338 pages, 12mo, cloth: net $1.00, postpaid $1.11.

PRIMARY ELECTIONS. By C. EDWARD MERRIAM.

For students of American political history, and especially of American party history, this volume will be particularly valuable. It gives a clear account of the various laws and cases, and a critical discussion of the present primary question. The absence of literature on this subject makes the appearance of the book especially timely. Many general readers as well as the special students will find it of interest. 300 pages, 12mo, cloth; net $1.25, postpaid $1.35.

ADDRESS DEPARTMENT 21

THE UNIVERSITY OF CHICAGO PRESS

CHICAGO NEW YORK

LONGMANS, GREEN, & CO.'S LIST

GOVERNMENT BY INFLUENCE and Other Addresses. By Elmer Ellsworth Brown, Commissioner of Education of the United States. Author of "The Making of Our Middle Schools," etc. 8vo, pp. x+245. $1.35 net. By mail, $1.48.

The Addresses included in this volume were delivered on various occasions during the first three years of the author's service in the Bureau of Education.

In collecting them for the purposes of this volume alterations have been freely made in the text, and considerable portions have been rewritten.

EAST LONDON VISIONS. By O'Dermid W. Lawler. Crown 8vo. $1.75 net.

The early life of an East Ender born and bred, descended from an old East End family. In many parts founded on fact, the book aims at showing the gradual revelation of the high and essential things of Life to a poetic youth, by experience of want, by excellent humble teachers, and by vision. It contains description, incident, and origiual symbolism; passages of romance and humour, criticisms of Life and of coutemporary religious and social forms. The author's work is far from being conventioual either in substance or in treatment, but its deep note is an insistence on the simpler and perennial truths of the Christian religion, rediscovered and restated.

NEIGHBOURS AND FRIENDS. By M. Loane, Author of "An Englishman's Castle," "The Queen's Poor," etc. Crown 8vo, cloth. $2.00.

AN ENGLISH STUDENT'S WANDER-YEAR IN AMERICA. By A. G. Bowden-Smith. Crown 8vo, cloth. $1.50 net.

THE RISE OF SOUTH AFRICA: A History of the Origin of South African Colonisation and of its Development towards the East from the Earliest Times to 1857. By G. E. Cory, M.A. King's College, Cambridge, Professor in the Rhodes University College, Grahamstown, South Africa. (In Four Volumes.) Vol. I. From the Earliest Times to the Year 1820. With Map and Illustrations. 8vo. $5.00.

THE LAST YEARS OF THE PROTECTORATE, 1656-1658. By Charles Harding Firth, M.A., Regius Professor of Modern History in the University of Oxford. With 3 Plans. 2 vols. 8vo. Vol. I. pp. xx+342, Vol. II. pp. xii +346, $7.00 net.

These volumes are intended to be a continuation of the "History of the Commonwealth and the Protectorate" which Dr. S. R. Gardiner left unfinished.

THE GOSPEL OF THE KINGDOM: or, The Sermon on the Mount considered in the Light of Contemporary Jewish Thought and Ideals. By H. E. Savage, D.D., Dean of Lichfield. 8vo, pp. xviii+274. $3.50.

This work had its origin in a course of Lectures which the Dean, while Vicar of Halifax, delivered in 1906 and 1907 to gatherings of clergy at York, South Shields, and Halifax. It takes the form of a full interpretative running commentary. His conviction that the Sermon reflects at every turn the various phases of Jewish national feeling at the time necessitates considerable attention being paid to the Hebrew equivalents of the phrases in the discourse.

NEW YORK, THURSDAY, MARCH 17, 1910.

The Week.

The Government's report on the country's foreign trade in February shows that imports of merchandise, last month, ran $4,300,000 above exports. The reason why interest attaches to such an excess of imports is that nothing of the sort has been witnessed at this time of year since 1895. Within that fifteen-year period, the month of February has presented an unbroken series of "export balances," rising as high as $50,000,000 in February, 1900, and $83,000,000 in February, 1908. This change in relation of exports and imports is not an accident of a single month. When imports ran beyond exports last June, the occurrence was noted as the first import excess of any month in thirteen years. July and August repeated the showing; even when the heavy export movement of produce began in the autumn, the excess of exports was extremely meagre, as compared with other recent years. For the full eight-month period from the middle of last year to the beginning of this month, exports ran $189,000,000 above imports, as compared with $341,000,000 a year ago. The excess of exports was, in fact, nearly $100,000,000 short of that reported for the similar period in any other year since 1896.

It is not necessary to subscribe to the so-called "mercantile theory" to understand that some important economic influence is at work to have caused such a change. The February figures, which are fairly typical of recent months, show a decrease in the export movement, as compared with other recent years. This is accounted for, first by the deficiency of last year's American cotton crop, but also by the fact that American prices, both for cotton and grain, have been held so high that foreign consumers have largely abandoned our market. To explain this situation, the prevalent theory on the grain exchanges is that consumption in our own country has increased so much faster than production that even an old-time "bumper crop" no longer provides a sufficient export surplus. This is a debatable question; and a time when the practice of holding back grain for higher prices is much in vogue is not the best time to establish principles regarding normal supply and demand. But whatever may be said of the export trade, the facts that last month's imports far surpassed all precedent for the period, that each of the past five months had a similar story to tell, and that our importations since the middle of 1909 have exceeded by $90,000,000 even the hitherto unprecedented total of 1907, cannot easily be explained, except on the basis of prices more or less out of joint with the rest of the producing world. These conditions have some bearing on such other phenomena as the current complaints over cost of living in this country, and the recognized activities of speculation in all American commodity markets.

Mississippi is not only to be congratulated upon the defeat of Vardaman, but upon the high character of his successful rival, Leroy Percy. A lawyer of distinction who has practised for years in the highest courts of his State, he has the universal respect of its citizens. It is true that he has been an attorney of corporations, even of railways, but no one believes that this will in any way interfere with his absolute independence as a United States Senator. In his speech at Greenville, after his return to his home upon his election, Mr. Percy gave evidence of his enlightenment by declaring that it was high time that the era of dissension, of strike breeding, of stirring up antagonisms between the races, should come to an end. In this he stands with Senator Gordon, whose brief service of two months was so satisfactorily wound up by a heartfelt expression of the affection he felt for the negro. While Senator Percy was taking his enlightened stand, Vardaman was announcing his candidacy for the vacancy in 1911, his platform to be white supremacy and the repeal of the "negro amendments to the Constitution." In other words, it is negrophobia—the only reason for his notoriety. Fortunately, there are plenty of signs that this is beginning to nauseate the thinking Mississippians. For instance, Dr. J. P. Moore, a highly respected octogenarian, writes to the Yazoo City *Herald* that "it is time that this old hackneyed negroism as a political asset should cease, in view of the universal knowledge that the negro is not a political factor in Mississippi."

It is with pleasure that we note the appearance of the Secretary of War before the House Committee on Military Affairs in opposition to the reinstatement of the seven cadets dismissed from West Point for the Sutton hazing. We, with others, had been led to believe, from press dispatches, that he favored their restoration, as well as that of a group of cadets dismissed before the seven. He has now endorsed the position of Col. Scott, the superintendent of the Military Academy, and this has made it impossible for Congress to put the disgraced cadets back. We regret, however, that at the same time Mr. Dickinson reaffirmed his opinion that there should be varying punishments for the various kinds of hazing. Years of experience at West Point have demonstrated that if this great evil is to be stamped out, it can only be by putting the severest punishment upon its every manifestation. Annapolis and West Point are the only places where hazing of this kind has persisted; as we have previously pointed out, it is worse at West Point than in any civilian school, because of the ability of the torturers to over-awe their victims by means of their military authority.

In 1907, the value of property consumed by fire in the United States, excluding forest fires and marine losses, is placed by the United States Geological Survey at $215,084,709. If we add the excess cost of fire protection necessitated by non-fireproof construction, and the amount of premiums over insurance paid, the total fire loss stands at more than $456,000,000, or above half the value of all buildings constructed within the year in this country. Our per capita fire loss in the year cited was $2.51, as against an average of 33 cents for the urban population of the six leading European countries. The remedy that is usually brought forward and one that is insisted upon in the Geological Survey's report consists in improved building methods that shall approximate fireproof

construction, as an ideal. The principal reason for the great difference between the amount of fire waste in the United States and Europe, says the report, is that there are but few wooden buildings in Europe and practically none in the great cities. And we have authority given on this point, from Trieste, Nice, Lyons, Berlin, and elsewhere. The case is summed up by a quotation from a special consular report:

> In Europe the fire insurance laws are remarkable, chiefly because they compel insurance in some countries, while in all cities they prevent great losses by insisting on the erection of only stone and brick buildings. The fire department systems are ridiculously inadequate as compared with those of American cities, yet the net results are better. French law compels insurance against fire, not only for the benefit of the owner, but for his neighbor.

Within the United States the figures reveal a surprising lack of difference in per capita loss between the city and the country. The Geological Survey's figures show that in 2,976 cities and villages with a population aggregating 34,000,000, the per capita loss was $2.34 in 1907, while the rate for rural districts was $2.49. As a matter of fact, a difference between city and country does show in another set of figures. New England, with New York, New Jersey, and Pennsylvania, an industrial section, having a population of nearly 24,000,000, suffered in 1907 a fire loss of $59,447,000, giving a per capita loss of $2.50. In the same year, eight South Central States, having a population of 16,300,000, predominantly agricultural, suffered a loss of $59,905,000, or $3.66 per head. It is, to say the least, a striking fact that of two sections, the one that is enormously the wealthier should actually suffer a smaller loss than the other.

"There is no princip'e of law or of political economy," says the brief for the Standard Oil Company, "which requires a manufacturer to give away a profit which he can make by economies in manufacture." Very true; and nobody would object either to the profits obtained by the Standard Oil Company or to the amount of business it was able to do, if these were simply the result of "economies in manufacture," unaided by illegal methods of driving competitors out of business. It is one of the curiosities of argumentation that defenders of Trust methods assert with one breath that the economy of large-scale production is such as to give an insuperable advantage to the giant manufacturing concern, and makes something like monopoly inevitable, and in the next breath ask us not to interfere with methods and practices designed to kill competition because it is best to have monopoly. If the economies of production on a gigantic scale are so tremendously effective, why not trust to the natural gravitation of the business toward that condition? Why kill the doomed man before his time by resort to unfair, corrupt, and abhorrent practices? What assurance can the public have, in any given case, that the competitor would have died a natural death if he hadn't been strangled? And finally, how sball we find out how much of the extra profit made by the big concern that has swallowed the little ones is due to economy and how much to its having got its competitors out of the way?

It is a notable victory that Josephine Preston Peabody has won at Stratford-on-Avon, over more than three hundred competitors, with her play "The Piper." To be hailed the winner in a poetic contest in the birthplace of Shakespeare himself is a distinction of which she, and with her all American womanhood, may well be proud. There is a certain significance in the fact that so striking a work should have to go abroad to find managerial appreciation and the certainty of speedy production. So fine a native dramatic product assuredly ought to have found its first theatrical home in New York city. Its merits, whether it is regarded as a poem or a play, are of a sufficiently rare and obvious sort to attract the attention of even a careless reader. They were described in this journal months ago as appealing equally to youthful sympathies and mature intelligence. But the piece has a spiritual and poetical bloom which in stage representation could be preserved only by the most skilful and delicate treatment, and it is satisfactory, therefore, to know that it is to be played by the company of Mr. F. R. Benson, who has done more for the poetic drama than any other living man. Of course, we shall soon have "The Piper" here, now that its merits have been acknowledged elsewhere.

The principle that the King can do no wrong has been extended by Mr. Balfour to the realm of philology. Hardened as the Unionist leader is to King's Speeches, he was forced to confess that the King's Speech which opened the present Parliament was an amazing piece of English. He spoke of the "ambiguities lurking in that remarkable specimen of our mother tongue," and concerning one passage he doubted whether it had any meaning at all, inasmuch as "it appeared to embody two quite different policies which had no connection whatever except that it had been possible to force them into the framework of one ungrammatical sentence." Mr. Balfour, however, referred to the unkind person who said that the King's Speech is always more stupid than the most stupid man in the Ministry, and wondered whether it could not be said that the grammar of it is sometimes worse than that of the most illiterate man in the Cabinet. But just when Mr. Balfour seemed to have subjected himself to the charge of high treason and the *peine forte et dure*, he recalled that it was the Ministers and not his Majesty that are responsible under the Constitution. Mr. Asquith thus has one more sin to answer for.

Consul-General Griffiths of London has just made a report to the Department of Commerce and Labor on the working of the British Labor Exchanges. He says that on the opening day nearly eighty exchanges were in operation and thousands of applications for work were received. The applicants mainly represented the better class of labor. On the first day of the opening in Nottingham 557 workers and 120 employing firms registered. These were followed on the second day by 580 workers and 87 firms. One of the emp'oyers alone applied for sixty skilled hands, and though most of the skilled hands were placed, the registered firms were not able to fill all their vacancies. This fact seems to show that the operation of the law of supply and demand in the labor market is by no means automatic. Resort to the artificial aid of an exchange quickly brought worker and employer together. A labor clearing-house system of some sort would probably prove helpful, wherever intelligently tried. Such was the conviction of Mr. Oscar S. Straus when he was Secretary of the Department of Commerce and Labor. But we have been

content to let England make the first move.

"At the close of his examination," we are told in a recent dispatch from Paris, "Duez coolly criticised the lack of supervision and control, which, he said, was responsible for the embezzlement." Everybody must admit that it *was* pretty cool for the man who had stolen something like $2,000,000 out of the funds entrusted to him as one of the liquidators of church property, to put the blame on the fact that he was too completely trusted. But, after all, was not Duez simply applying to his own case the logic of the environment idea that is so current nowadays among kind-hearted persons in reference to the whole subject of criminality? If it is environment, and heredity, and what not, that are to be blamed for nearly all the wrong-doing in the world, if we are going to hold people completely responsible for their conduct only in cases where the conditions are favorable to right conduct, why may not a man complain with just as much reason of conditions being too soft as of their being too hard? Becky Sharp said it was easy to be virtuous on ten thousand a year; Duez says it is easy to be virtuous if you are constantly watched and guarded. There is a deal of truth in what they both say; but if the rules of law and the judgment of society had been based on these notions, not much would have been left of the forces that go to the making of character.

The *Marine Rundschau*, a publication edited in the German Ministry of Marine, recently published an article on the British naval administration, of such ability as to make English authorities admit that the best-informed British expert could have done no better. The point of especial interest to those interested in the American Navy is that the *Rundschau* article condemns the fusion of the naval engineer and the combatant officer as making entirely too high a demand upon the abilities of a single man. We are inclined to think that if this critic were to follow happenings in the United States Navy, he would find much to confirm him in his opinion that a naval officer ought not to be asked to be at once a fighting expert, an engineer, a leader of men, and a master of battle-tactics. There is great dissatisfaction in the Navy Department with engineering conditions at the Mare Island navy-yard. Complaints of unsatisfactory work on certain vessels are rife. The two new and supposedly fast cruisers West Virginia and Maryland were in such bad shape on their recent voyage from Honolulu that they had to be towed to San Francisco. A lieutenant has just been tried for a boiler explosion on the Colorado, which cost two lives. The collapse of a boiler tube on the North Dakota severely scalded four men. A boiler-tube explosion on the Hopkins at San Diego killed one fireman. The New Orleans steamed out of San Francisco for Shanghai, but had to return because of leaking boilers. So runs the chronicle of only three months.

The acquittal on March 9 of Nicholas Tchaikovsky is a splendid vindication of the force of public opinion. Had the sympathy of America and Great Britain been less clearly manifested in behalf of the man who has stirred public feeling in this country as no other political refugee has done since Louis Kossuth, it would have gone hard with him in St. Petersburg. Not that the tribunal which sat in judgment upon Tchaikovsky acted in direct response to pressure from abroad. The behavior of the judge and jury is at the same time a splendid vindication of the character of the Russian people as opposed to the tyrannous and benighted governmental system under which they live. It needed only that governmental coercion should be relaxed, for a Russian civil court to act in accordance with the dictates of enlightened justice. The Czar's Government, having yielded something, might yield a little more, and a pardon should be forthcoming for Catharine Breshkovsky, who stands sentenced to exile in Siberia. It is, no doubt, a great mercy to this woman of nearly eighty that the usual accompaniment of hard labor was not imposed. But the Government, triumphant over revolution everywhere, can afford to be more generous. Of that latest movement for freedom in Russia, begun with such high hopes five years ago, promising for a time the reconstruction of an empire and a people, and sinking into tragic defeat, this verdict at St. Petersburg marks the finale.

In a detailed study of Turkish finances under the new régime, M. Raphael Lévy, in the *Revue des Deux Mondes*, arrives at the conclusion that, contrary to general belief, the financial problem in Turkey is by no means the most difficult one. The first two Constitutional budgets raise high hopes for the future. If no complications come up to plunge the country into unforeseen expenditures, we may see the chronic Turkish deficit wiped out in a few years. The increase in customs duties, which the Powers are in a mood to sanction, will swell receipts by a very considerable amount. The interest on the present debt is not a crushing burden, and the sinking-fund operations that are now being carried out on a large scale are an important factor. An extraordinary budget for public works will have to be established, but such an outlay is bound to be productive if carefully managed. Turkey has serious problems to deal with, but the laboriousness and docility of the people should carry the country through.

After Russia, Persia, and China the constitutional movement has seized upon the twelve hundred subjects of the reigning Prince of Monaco. The spirit of democracy has swept throughout the length and breadth of Monaco's eight square miles of territory, and amidst ominous mutterings of the approaching storm the croupiers at Monte Carlo take in their stakes with even more than usual solemnity. The people of a state smiled upon by Fortune to an altogether unprecedented degree have long been the victims of a Prince who has eclipsed the record of the worst king that ever imposed taxation without representation, by giving his subjects neither taxation nor representation. For years Prince Albert has supplied all the revenue for the country without giving his subjects a voice in the spending of it. Relieved of all worry about the tax-collector, and having no industry or commerce to occupy their minds aside from the exportation of a little olive oil, oranges, and lemons, and the importation of an enormous number of wealthy foreigners, the people have had all the more time to brood upon their wrongs. Hence the explosion against a monarch to whom the outbreak must have come as suddenly and as unpleasantly as somebody's breaking the bank at Monte Carlo.

WHAT AILS THE REPUBLICANS?

Gov. Hughes declared in his statement last Thursday night that "this is a critical time for the Republican party in this State." He also referred to that "anxiety for the future" which was implied in the efforts of Senator Root and others to tone up the Republican leadership in New York and make the party policy responsive to the wishes of the voters. But this Republican anxiety for the future is not confined to any one State. It is nearly universal. At Washington the party leaders do not disguise their apprehensions. They are looking forward to this year's elections with not only the fear but the expectation of defeat. The Washington correspondent of a Republican paper put the thing with amazing bluntness the other day:

> There is no disguising the pessimistic tone in which all well-posted Republicans discuss the prospects for the next House. They are all fearful of a reversal of the present Republican majority, and some go so far as to say that it is only a question of how much may be saved from the wreck.

So far as the New York situation is concerned, the reasons for pessimism lie on the surface. For three years past the Republicans of this State have been organized with their brains and character under and their selfishness and stupidity on top. There is no need of going into details. When you have mentioned the name of Hughes, and then have set against it the names of Woodruff and Barnes and Allds, you have told the whole story. Its lesson is at last bitten into the minds of those who have the true welfare of the party at heart, and this accounts for the war on the old party régime begun by Messrs. Root and Griscom. Last week's choice of Cobb as leader of the State Senate was but the first skirmish, which there was very little hope of winning, but which is certain to be followed up until the retirement of Chairman Woodruff is forced and the party organization made at least faintly representative of the demonstrated desires of Republican voters. If this is not done, pessimism will deepen into absolute gloom, and the defeat of the Republicans will be assured before a single ballot is cast.

It is necessary, however, to take a broader look afield and ask for some of the general causes of the general Republican despondency. Why is it that with in little more than a year since the inauguration of Mr. Taft—carried into office as he was by a great majority—there should be so definite a feeling, which the President himself frankly shares, that the country is turning away from the Republican party? A partial explanation is to be found, of course, in what is called the swing of the pendulum. Most Presidents enter upon a period of unpopularity, and it usually comes in the second year of their term. In the days when our politics took a regular course, so to speak, it was not uncommon for the President's party to lose control of the House in the mid-way election. It was so with Hayes and Harrison, as it was with Mr. Cleveland in his second term; so that there would be no great violation of precedent if Mr. Taft should see a Democratic House chosen next November. The ultimate political effect of such an event would depend very largely upon what the Democrats did with the House after they got it. Judging by their performances in the recent past, they would promptly use their new control as a knife with which to cut their own throats.

It must in fairness be admitted that there is more in the prevailing dissatisfaction with the Republican party than simply the inertia which so easily follows a victory, or the reaction which may come from disappointed office-seekers. A part of it, no doubt, is due to circumstances beyond the power of the President or the party leaders to control, and for which they are not responsible. After seven years of Roosevelt, the country was bound to have fallen into a state of "nerves," and the new Administration has had to suffer in consequence. More important is the sudden rise in the prices for the necessaries of life, and the widespread discontent that has gone along with it. The Republican party promised prosperity and, indeed, cannot live without it; yet the revival of business since 1907 has been accompanied by complaints that the high cost of living more than eats up steady wages, while labor disputes have been thickening ominously. Strictly speaking, the Administration cannot be held accountable for more than a trifling part of these evils, but it is a law of politics that people will go against a Government under which things occur which they do not like; and there is no doubt that the President and his party will suffer heavily in consequence of prevailing discontents, unless they are somehow allayed.

Yet the hoarsest ravens which are today croaking on the Republican battlements are tariff birds come home to roost. It is the Aldrich-Payne tariff, and especially the manner in which it was enacted and then defended, that is undoubtedly the most crying grievance today against the Republican party. President Taft's Winona speech in apology for the revised tariff was the wettest blanket he has cast over the party. People could understand how he might fight for lower duties and an honest bill and still be beaten; it was really a wonder that he got as much as he did out of a protection-ridden Congress; but the excuses he made for what was done, and the praises he bestowed upon the handiwork of those who were against his real views, had a sickening effect. What the public clearly saw was that private interests had again dictated too large a part of the tariff, and the inevitable fear was that private interests would continue to keep their clutch upon the Republican party in all other important legislation. Here lies, we believe, the chief reason for the current distrust of the Republican party and for Republican depression. The country is offended at the evidence which it thinks it has that a selfish oligarchy is in control of Congress; and unless the laws passed at this session shall prove the contrary, the Republican party cannot go to the polls in the autumn without the strong likelihood of receiving a severe rebuke.

JAPAN AND THE UNITED STATES.

Mr. Schiff's remarks at the luncheon of the Republican Club, in this city, last Saturday, on the situation in the Far East have set a big ball rolling. It doesn't matter very much what particular words he used. The language of an after-dinner speech is seldom reported with even approximate accuracy; in the present instance, the reports vary quite materially. The essential point was that he spoke of an impending struggle of the utmost gravity, in which the concert of action of Russia and Japan for the domination of China, with England a party to the compact, is the central factor. When a man of Mr. Schiff's position speaks in this tone, it

makes comparatively little difference whether he does or does not specifically make mention of war. The effect on the public, in his own country and abroad, must be to revive the war-talk which is ever ready to spring up, and such has been the effect in this instance. It will probably blow over after a little while, but for the moment it has been put to the front more seriously than has been the case for many months. We are forming the Japan habit, very much as the English have formed the Germany habit; and the chief source of the phenomenon is the same in both cases. Other factors keep coming and going, but the matter of trade is always with us. The question remains whether we are going to keep our heads level on that subject or are going to magnify it beyond all reason. On the answer to this question, more perhaps than anything else, depend the future possibilities of the Japan-America situation.

The New York *Times* of March 9 devoted the whole of its editorial columns to a discussion of the relations between the two countries. In an article of remarkable ability, it reviews the history of our relations with Japan, and sets forth what it regards as our present grievance. Its protest and criticism centre about the refusal of both Japan and Russia to assent to Secretary Knox's proposal for the neutralization of the Manchurian railways belonging to those countries respectively; though there is in it the background of complaint of a more or less serious and more or less definite character, made by Americans as to discriminations against them in their Manchurian business. But the article begins with a comment on the surprise that has been expressed in Japan over "Mr. Jacob H. Schiff's prediction of a great struggle in the Far East—for it was a great struggle, a commercial struggle, not a war, that Mr. Schiff predicted—in which it seemed to him probable that the United States, Japan, and other great Powers would be involved." And the particular point that we wish to make is that this kind of denial that the "struggle" predicted would be a war, this kind of assertion that it would be a "commercial struggle, not a war," whether intended to have substantial effect or not, really leaves the matter just where it was. Nobody supposed Mr. Schiff to be prophesying war to-morrow, or next year; he would be the last man to do such a thing; and if he had done it the words would be passed over as a mere momentary indiscretion. The really serious thing about this Manchurian trade talk is that it is not sensational, but deadly sober; and the mischief it does is in producing the impression not that we are on the eve of an explosion, but that permanent interests of tremendous moment are involved, which we must protect at all hazards. If the men of peace keep cultivating this notion, we may be sure that the men of war will find in it their best opportunity.

By all means, let our Government exert itself to secure to American trade every opportunity to which it is justly entitled. When agreements are violated, when improper discriminations are made, let the resources of our State Department be vigorously put forth to secure a remedy. But let us not rush into the field of popular agitation, and treat as an occasion for solemn national foreboding that which is fit subject only for the patient endeavors of those officially charged with the conduct of our foreign relations. The trade of Manchuria may become in the future a matter of great importance to the people of the United States, and we must provide in the present against difficulties in the future. But do not let us act, with regard to the vague possibilities of a future that nobody can forecast, as though we were dealing with a vital or critical concern of the present. There will be plenty of time for a thousand forms of negotiation and diplomatic pressure before the trade of Manchuria begins to be of any immediate importance to the nation. The *Times's* article says that "to Manchuria alone we used to send $10,000,000 worth of cotton goods every year," a statement which, we fancy, can be true only of a very few years, and of these for reasons of an exceptional nature; but what is quite certain is that our entire export trade to the entire Chinese Empire never exceeded $20,000,000 prior to the Japanese-Russian war, except in the single year 1902, when it reached $24,000,000; that the average of that trade for the ten years preceding the war was less than $13,000,000; and that before that decade it was much smaller still. If we take in Hongkong, an addition of seven or eight million would have to be made. This, of course, settles nothing; but, after all, it must make some difference to the feeling of rational men whether they imagine they are dealing with enormous immediate interests, or whether they realize that the entire Chinese export trade—the whole of it, not merely the profits—is, for this rich nation, a mere bagatelle.

The truth is that the magnifying of the importance of foreign trade is one of the traditional superstitions of mankind. The persistence of the balance-of-trade delusion is one of its manifestations; the idea that a country is in imminent danger of death by suffocation if she does not keep every avenue for export open is another. In England, of course, there is special reason for this kind of feeling; with a population in those two little islands nearly half as great as that of the United States, over-seas trade is with the British a matter of life and death. But who would have thought it possible, a few years ago, that anybody could think of our vast country as in any such position? To that kind of talk, however, we are beginning to accustom ourselves; and among the tasks of the economists of the country must henceforth be included that of teaching the necessity of weighing the benefits of foreign trade in the scales of reason.

PEARY AND CONGRESS.

The sub-committee on naval affairs is undoubtedly within its rights in demanding a sight of Peary's proofs before recommending that he be voted the thanks of Congress. But there is a right way and a wrong way of going about this matter, and it seems to us that the sub-committee has distinctly fallen into the latter. With Congressman Macon as its intemperate spokesman—a man whose "farthest North," as one of the Washington correspondents puts it, is the "sunk lands" of Arkansas—it is in danger of making what should be a spontaneous and handsome act appear painfully ungracious and grudging. The question of Peary's reward will begin to seem, to foreigners at least, of less pressing interest than the question of the manners of the Congress of the United States.

That there have been unfortunate misunderstandings about the whole affair may be freely admitted. A frank and direct treatment of the matters at issue would, it must seem, have cleared them

all up. But with all the inconclusive disputes about the nature of Peary's contract with his publishers, about the danger that his proofs submitted "in confidence" to the committee would instantly become public property, and about the necessity of calling in experts in any event, the whole affair has been left in a most unhappy position. It is high time that a more manly and nonorable spirit were manifested by all concerned. The facts are clear. It is not asserted by any one that the sub-committee would be competent to pass upon the proofs if they were submitted to it. No one supposes that Congressman Macon would recognize an astronomical observation if he should meet it in the street. Suppose that Peary had in the first place laid his records before the sub-committee, and that it had given its verdict in his favor, what weight would have been attached thereto by the learned world? One can fancy the sneers in the European press. The Geographic Society, though having no official authority, invited real experts to pass upon Peary's proofs, and their findings were instantly accepted by scientists and academic bodies everywhere. One representative of these experts has appeared before the sub-committee to state in general terms the nature of the evidence placed in their hands by Peary and their complete satisfaction with it. But apparently the committee will not be content until astronomers and navigators explain to it in person, and with the documents before them, the meaning of the technical records and calculations which Peary made, and which probably not one Congressman unaided would be able to understand. As we say, the committee may be acting within its strict rights in so doing, but it ought to take heed lest it put Congress and the whole country in a bad light.

For it is not simply Peary that we have to think of in this connection, but our national reputation. In the presence of a giant achievement with which all the world has rung, it will not do for our Representatives in Congress to appear like puny men with mustard-seed minds. In every controversy over the voting of formal thanks and rewards to a national hero, there is always danger that Congress or Parliament may hurt its own prestige more than it can dim that of the man it is churlish in honoring. In Southey's "Life of Nelson" there is an instructive passage relating to the action of Parliament in rewarding the victor of the battle of the Nile:

> He was created Baron Nelson of the Nile and of Burnham Thorpe, with a pension of £2,000 for his own life, and those of his two immediate successors. When the grant was moved in the House of Commons, Gen. Walpole expressed an opinion that a higher degree of rank ought to be conferred. Mr. Pitt made answer that he thought it needless to enter into that question. "Admiral Nelson's fame," he said, "would be coequal with the British name: and it would be remembered that he had obtained the greatest naval victory on record, when no man would think of asking whether he had been created a baron, a viscount, or an earl!" It was strange that, in the very act of conferring a title, the minister should have excused himself for not having conferred a higher one, by representing all titles, on such an occasion, as nugatory and superfluous. True, indeed, whatever title had been bestowed, whether viscount, earl, marquis, duke, or prince, if our laws had so permitted, he who received it would have been Nelson still. . . . It depended upon the degree of rank what should be the fashion of his coronet, in what page of the red book his name was to be inserted, and what precedency should be allowed his lady in the drawing-room and at the hall. That Nelson's honors were affected thus far, and no farther, might be conceded to Mr. Pitt and his colleagues in administration: but the degree of rank which they thought proper to allot was the measure of their gratitude, though not of his services. This Nelson felt; and this he expressed, with indignation, among his friends.

The thing that we feel most strongly about is not the exact nature of the recognition to be accorded Peary, but the duty of doing whatever is done in a large and generous way. Peary's real reward he has already received. Unless we grossly mistake him, it came to him when the first conviction swept upon him that he had attained his long-sought goal. In the thrilling sensations of that glorious moment anything that might follow in the way of applause or tokens of gratitude would have seemed poor and cheap. Of course, the acclaim of brother-explorers and recognition by scientific bodies must have been sweet to him; but as far as official action by Congress goes, that is in a very true sense its affair, not his. And the point for the sub-committee to get into its sub-consciousness as soon as possible is the need that Congress bear itself so as not to dim, by a lack of grace and magnanimity, the lustre which Peary's work has given the United States. Just at present, it is Congress that is on trial in the eyes of the nations, not Peary.

If any new meaning is to be read by the affair into the worn phrase, "the ingratitude of republics," we think it is that they are not so much ungrateful as awkward. Even when they want to do fine things, they do not always know how to go about it. In the present instance, it may be that a republic which unguardedly slopped over in connection with the wrong man feels particularly tongue-tied when it comes to expressing thanks to the right man. But whatever difficulties of detail there may be to overcome, it is not for Congress to split hairs or stick in the bark of nonessentials, but to make itself the dignified voice of a national tribute to one whose fame has brought new glory to the United States.

LETTERS FROM THE GRAVE.

President Harrison's letter to his close personal friend and Attorney-General, W. H. H. Miller, effectually disposes of the Platt charge that the Senator from New York was first promised and then denied office. Platt a Secretary of the Treasury! It was incredible on its face that any President should ask him to a seat at the Cabinet table, no matter how great the party necessity for campaign funds. And if any person in Mr. Harrison's name, whether Mr. Elkins or any one else, was so foolish as to promise a Cabinet office to Platt, Mr. Harrison was bound in common honor to have disavowed the act of his agent. Now we have, from the grave as it were, Mr. Harrison's positive statement that he never authorized any one to make promises to Platt and made none himself. Indeed, he added, in the letter before us, "You know that while I was President I made myself unpopular, perhaps, by reason of the fact that I never said to any one that I would make this or that appointment until it was actually made."

That this is the safest rule for Presidents, no one can deny. We have, fortunately, gone beyond the time when it was deemed necessary, in order to insure Presidential success, to pledge the Cabinet positions in advance of the election. Lincoln's friends, at the time of his nomination, promised the position of Secretary of War to Simon Cameron in return for Pennsylvania's votes in the convention, and Lincoln loyally kept the promise, though it cannot have been easy to do so. It was thought at the

time that Seward, too, then received a promise of the Secretaryship of State as a balm for his great disappointment at Chicago; but there was no promise made to him any more than, as it now appears, by Mr. Harrison to James G. Blaine. If we are still wringing large contributions out of important business interests, as Platt did for Harrison, under threats and duress, and are still awarding diplomatic offices, as under Cleveland and Mr. Taft, to campaign contributors, we are surely graduating from this stage of our political pilgrim's progress. Whatever may be thought of recent campaign managers, no one will, we think, deny their superiority to men of the Quay, W. W. Dudley, and Platt type.

When one deals with men as unscrupulous as these, it well becomes a public man to prepare a defence to be used when he is in the grave. Of course, in this Harrison controversy, the President had a vast advantage in point of character over his assailant. Mr. Harrison's prestige and reputation steadily increased after his return to private life. Mr. Platt's pitiful end, deserted of quondam friends and stripped of power, will long point a moral and adorn a tale. But had there been no letter to Mr. Miller, fair-minded men must have deferred a final judgment until the historians had had an opportunity to examine the whole matter in the light of Mr. Harrison's record, and of contemporary evidence. Of the certainty that much of this will appear, and of its value, the diary of Gideon Welles, now publishing in the *Atlantic*, is fresh proof. It is just this turning-up of new and unsuspected material that lends so much of zest and interest to the historian's life. Not only do musty records afford great surprise, but from attic and cellar come long-forgotten documents to elucidate a hitherto hazy episode or to illuminate afresh by the searchlight of a strong, keen personality some well-studied period. The publication of President Polk's dairy of the Mexican War, so long after that national crime, is another case in point.

For the journalist, who must of necessity base his judgments on what is known at the moment, the Harrison-Platt episode carries its warning as well. But not journalists alone suffer from this. Statesmen also must judge too often with but half the facts before them. Mr. Cleveland, it is related, never had time to read the *Congressional Record* bearing upon some of the most crucial actions of his Administration, until in retirement years afterwards. If he burned anew with indignation at some of the misstatements made, he learned also much that might have induced him to modify his opinions, or even at points change his course, had he but known the facts at the time. There is a warning here for the biographer also—to judge a man not so much in the light of all the facts available after a half-century, but, if possible, in the light of the knowledge available to his subject at any given time in his career. No actor in a great drama is apt to see the whole stage, or survey it at the proper range. To do so is the historian's privilege and his recompense for the hours of unrewarded labor. Out of just such letters as these of Harrison and Platt does he reconstruct the whole *mise en scène*, and reanimate the actors for the sake of bringing out the truth. And no one can tell at what moment or from what grave documents of the highest value will appear.

COLLEGE MEN IN POLITICS.

Organs of public opinion, of the type that hates cant, sir, and does not hesitate to call a spade a blanked shovel, would be hard put to it if they were asked which arouses greater glee in their disenchanted souls, the scholar in politics or the reformer who falls by the wayside. When a backsliding reformer happens to be at the same time a college graduate, as is very often the case, there is, indeed, more rejoicing over that one black academic sheep in the political fold than over ninety-nine other crooked politicians who are not college graduates, or ninety-nine other college graduates in politics who are not crooked. The American college has much to answer for in this imperfect world of ours. The wonder is that Harvard has not sunk before this under the weight of Harvard graduates who are arrested for violating the Anti-Trust laws, that Yale has held out under the disgrace of headlines like "Yale Graduate Attacks Wife with Hatchet," and that Columbia has kept up operations in spite of such of her alumni as are arrested for not paying their hotel bills. It is a characteristic piece of reasoning on the part of many persons to take it for granted that Alma Mater can do nothing for her students while they are with her, but to hold her responsible for their good behavior twenty-five years after they have gone.

Calling attention to the fact that this particularly disreputable specimen of the boss or that exceptionally corrupt legislator is a college graduate, proves nothing. The simple law of averages demands that a certain number of rascals in politics should be college graduates. More than any other nation in the world, we are a lawyer-governed people; and with the passing of the traditional system of studying law at the feet of the practising attorney, legal training has come to mean, as a rule, college training. If farmers and merchants and manufacturers and railway-builders were to be met with in our halls of legislation, there would be some chance of formulating comparative statistics of public virtue and public vice, as between the college-bred man and the self-made man. As it is, the number of college men who rule this country through the complicated machinery of democratic government is so very large that the number of weak brethren among them must, in all reason, make up a very impressive total. This is no answer, of course, to the man who believes that the college should be a device for turning out young men as perfect as Adam was before the Fall, and guaranteed to last. It does supply a basis for discounting the glee of the worldly-wise over the failure of the college to promote sound democracy, as deducible from this or that college man caught stealing.

But there is one type of the college man in politics whose rôle in our scheme of democratic government is already an important one, whose influence is bound to increase with time, and who, nevertheless, is strangely overlooked when it comes to making up the score for and against the college. One possible reason is that he is more frequently classified under the head of reformer than of college man. Of this type are the young men who in our principal cities have built up what is now a profession, the profession of social service. Whether their path lies in the field of settlement work, of charity organization, or of the more technical business of municipal research, it would be hard to overestimate the direct ef-

fect of their labors upon recent political history. Take New York. We need only remember how large a share in the overthrow of Tammany has been played by the entire complex of problems that is called up when we speak of the East Side. We have there the issue of poverty upon which corrupt politics battens, of vice which politics traffics in and protects, of overcrowding, of underschooling, of police neglect and police tyranny among the immigrant populations. This East Side which has displayed the moral forces that have swung elections, was largely discovered and made part of the common body politic through the efforts of the college settlements, the college investigators, the college cranks of every kind, who stir our disillusioned organs of public opinion to such high merriment.

Take Mayor Gaynor's Administration, with its record of fine achievement and still finer promise, and see how it is thoroughly permeated with, and based upon, the ideals that abide in the amateur college type of mind. It is not only that men have been appointed to high administrative office who have been closely identified with the movement towards a progressive and socially humane democracy, such men as Stover in the Park Department, or Murphy in the Tenement House Department, or Lederle at the head of the Board of Health; but even in so dry-as-dust a department as Finance, the good old methods of the practical politician are being thrown over in favor of the sane principles of bookkeeping and housekeeping worked out and popularized by a handful of college men engaged in the study of decent municipal government. Subway construction, school building, playground developmen are now gone at in the belief that the city is made for the well-being and happiness of its people, and not of the politicians. And that sentiment of the "people" in the city is largely the product of a campaign of education carried on by college men. Here, then, is a class of unofficial statesmanship which is coming to count more and more in our political life, and which the college is entitled to cite on its side of the question.

We have spoken of college men. We need only recall how large a place the college woman occupies in the field of social service to recognize how many women have surmounted their suffrage disqualifications and had their share in shaping political life in a great city.

PHILANTHROPY AND POWER.

It appears from recent developments that the great philanthropic foundation designed by Mr. Rockefeller will be made the subject of serious deliberation before it receives its charter from Congress. To say that this is as it should be does not by any means imply an attitude of unfriendliness toward the spirit or purpose of the gift. Mr. Rockefeller, whatever may be true of his methods of getting, has shown in his giving a sense of responsibility for the proper use of his magnificent opportunities that is worthy of all praise. In planning a permanent organization that would continue after his death to exercise the same kind of judgment in the expenditure of millions for educational and philanthropic purposes which he or his agents have been exercising now for many years, we have no doubt that he is animated by the sole desire to make his vast fortune productive of the greatest possible amount of good. But to apportion praise or blame is not the only function of public opinion in such matters, and it is no part of the business of Congress in the premises. The nation is called upon not merely, or mainly, to appraise motives, but to estimate consequences.

The Rockefeller Foundation stands out from among all the great benevolent foundations of the past by the combination of an almost boundless scope with enormous resources. The amount of the latter is not known, but it is safe to say that they will far surpass those of any other philanthropic foundation thus far launched in the world, with the possible exception of the Baron de Hirsch fund. But the comprehensiveness of scope, the indefiniteness of purpose, is far more distinctive of the proposed Foundation than is its probably colossal magnitude. The funds to which it invites comparison present in this respect a striking contrast to it. The Rhodes scholarship fund, for instance, is devoted to the prosecution of a single well-defined educational purpose. The Carnegie Institution has for its object the promotion of research. The Carnegie Foundation was, on its face, designed for an even more strictly limited purpose, its object being to improve the conditions under which the profession of college and university teaching is carried on. The Russell Sage Foundation is laid out on very broad lines, and the idea underlying it was a real innovation in the field of philanthropic effort; yet the purpose of it is quite specific. It is an agency designed to investigate the conditions that produce and surround poverty, and to promote the improvement of those conditions, directly or indirectly. The Baron de Hirsch fund involves a vast field of choice as to means, but its aim is specific enough. The General Education Board, magnificently endowed by Mr. Rockefeller, was a step in the direction of this new foundation, but it was confined to the field of education, and has been doing its work by systematic aid to existing institutions. The new Foundation goes far beyond any of its predecessors in point of indefiniteness and elasticity.

Of course, it is precisely this elasticity that constitutes the distinctive merit of the proposed foundation; looking to the long future, it allows for the unlimited possibilities of change in human conditions and human needs. But admirable as is the purpose thus held in view—the purpose of doing in each generation what in that generation most needs doing—the fact cannot be blinked that the lodging of such great discretionary power in a self-perpetuating body controlling a vast fund raises serious questions. It is true that Congress is to have power to amend or annul the charter; but there may be broad questions of policy which it is easier to decide aright before the charter is granted than to insist upon in future years in the face of established influences. And the main questions suggested, as it seems to us, are, first, whether there are any limitations of power that ought to be made from the start, and that may not be made in the charter as proposed; and, secondly, whether some other form of organization than that of a self-perpetuating body should not be demanded. The first question bristles with difficulties, to be sure; for experience shows how wide may be the actual scope of an institution's influence, even when its ostensible activity is limited to a narrow range. The Carnegie Foundation is exercising—in the main with great wisdom, thus far, we feel sure—a power over our educational institutions

that probably nobody suspected it would even attempt to wield, and that nobody can deny is capable of producing injurious consequences; and if a fund whose only weapon is the power to exclude a college from the benefits of its pension system can essay such a part, what limits can we hope to set upon the possible exercise of influence by such an institution as the Rockefeller Foundation, upon a thousand phases of the national life?

But the more difficult the problem of any effective limitation of power, the more serious becomes the question of the personal control of the Foundation. Can there not be found a more wholesome, a safer, method of organizing this great social force than that which would place it in the hands of a self-perpetuating body, the original members of which are the personal representatives of the donor? The answer will naturally occur that just this has been done, over and over again, in the case of our colleges and universities, without objection and, indeed, with explicit approval. But it must be remembered that, however complete in form may be the power of the trustees of a university, they are in fact constrained to act within fairly well-defined lines. They are subject, in the first place to the influence of the standard and traditions of the whole body of like institutions in the country and in the world at large; and, secondly, there arises inevitably, in the course of time, a body of alumni, whose power to make their views felt is always demonstrated sooner or later. No such agencies exist to limit the powers or to direct the energies of the men in control of such an institution as the proposed Rockefeller Foundation. With its undefined possibilities of influence upon the general welfare, would it not be wiser to have its management chosen—if not at the beginning, then as vacancies arise in the future—by men representing in some definite way the great permanent interests of the whole nation? Out of such institutions as the Presidency of the United States, the Supreme Court, the presidencies of our leading universities, and others that might be mentioned, would it not be possible to fix upon a little group of electors for the filling of vacancies as they arise? And would not the placing of the Foundation upon a basis of this kind be the best proof the founder could give of large-mindedness and of singleness of purpose?

NEWS FOR BIBLIOPHILES.

No collectors are more eager nowadays than the buyers of views of Old New York, and on the evenings of March 22 and 23 the Anderson Auction Co. of this city will hold a very timely sale of the Nelll collection. The series known as Bourne's Views, mostly from drawings by C. Burton, published in 1831; Davis and Imber's Views (1827), Milbert's lithographs (1825); early copperplates from the *Columbian Magazine;* early aquatints; interesting folding panoramas, and many views of business buildings on Broadway, and other sheets are included. In all the catalogue contains 433 lots.

A selection of duplicates from the library of Hon. Daniel B. Fearing of Newport, R. I., will be sold by the Merwin-Clayton Sales Co. on March 22 and 23. Mr. Fearing has been bringing together books on angling and kindred subjects for many years, and his collection is now, without doubt, the finest in the country. He was the largest buyer at the John G. Heckscher sale a year ago. Among the books in the sale are Brown's "American Angler's Guide" (1845); Pierce Egan's "Sporting Anecdotes" (1845); Houghton's "British Fresh-Water Fishes" (1879), and several editions of Walton's "Complete Angler," including Pickering's famous first edition (1836) and the very rare German edition printed in Hamburg in 1859, the greater part of which was destroyed by fire.

On March 24 and 25 the same firm will sell portions of the library of George Luff of New York, including a complete set of H. H. Bancroft's historical writings, 39 vols.; Daniel Webster's set of Sanderson's "Biography of the Signers of the Declaration of Independence," 9 vols.; the first edition of La Peyrouse's "Voyage autour du Monde," 4 vols. (1797); New York Colonial Laws (1752), printed by James Parker, and (1789) printed by Hugh Gaine; Stedman's "Narrative of a Five Years' Expedition against the Revolted Negroes of Surinam" (1806), with colored plates, several of which were engraved by William Blake and others by Bartolozzi; Haywood's "Civil and Political History of Tennessee" (1823); books on the Revolution, Indians, and New York, travels in the West, etc.

On March 22 and 23 C. F. Libbie & Co., in Boston, will sell the library of the late Joseph Stickney of Concord, N. H. Several very rare New England imprints are offered: Thomas Shepard's "Eye Salve" (1673); Hubbard's "Happiness of a People in the Wisdom of Their Rulers" (1676); Samuel Wakeman's "Young Man's Legacy to the Rising Generation" (1673), and his "Sound Repentence the Right Way to Escape Deserved Ruine" (1685). A long set of New Hampshire Registers (1772-1888), New Hampshire Laws and Reports, Genealogies, Confederate publications, and American newspapers are included.

On March 22 Stan. V. Henkels, in Philadelphia, holds a sale of autograph letters and historical documents. A letter written by John Hancock to Elbridge Gerry dated "Lexington 18 April, 1775 9 o'clock evening," beginning "I am much oblig'd for your Notice, it is said the officers are gone Concord Road, & I will send word thither," seems to show that the route of the British troops was known, and that there was no necessity for hanging signal lanterns in the tower of the Old North Church, or for Paul Revere's "Midnight Ride." There are important letters by Signers of the Declaration, Gens. Washington, Charles Lee, Greene, Steuben, Lafayette, Robert Howe, Wayne, and others, a curious manuscript by Thomas Paine, complaining of Washington's treatment of him, etc.

On March 28 and 29 the same auctioneer will sell the third part of the library of the late Clarence H. Clark, including the collections on art, archæology, engraving, and bibliography. Audsley's "Ornamental Arts of Japan," Audsley and Bowes's "Keramic Art of Japan," Gonse's "L'Art japonais," Owen Jones's "Alhambra," Lord Kingsborough's "Antiquities of Mexico," Nash's "Mansions of England," and Silvertre's "Paléographie universelle," are important works with colored plates. Mr. Clark's copy of the "Description de l'Egypte," 20 vols. folio, the great work prepared by the French savants who accompanied Napoleon to Egypt, was a presentation set from Louis Philippe, and each volume bears a presentation inscription stamped upon the binding. Several of William Loring Andrews's books are included, among them his rarest publication, the catalogue of his collection of Aldines, published in 1885, and limited to fifty copies.

Correspondence.

SHAKESPEARE'S SIGNATURE.

To the Editor of The Nation:

Sir: Supplementing the article in the March number of *Harper's Magazine,* "Shakespeare as a Man among Men," I may add a word with reference to the spelling and pronunciation of his name. For a century the orthography has been a perennial subject of debate. The whole question should be referred for settlement to the contemporary pronunciation and the calligraphic means of phonetic representation, a central point which has not generally been taken into account in discussions of Shakespeare's handwriting. The new signature may contribute its quota of aid in the solution. To those not familiar with manuscripts of Shakespeare's time, it is difficult to understand a system of spelling which, at first sight, seems systemless. We have so standardized and stereotyped our modern spelling and are so accustomed to regarding as ignorant any one who varies from accepted standards, that we are inclined at once to call the irregular orthography of three centuries ago likewise ignorant. But a scientific analysis on the basis of phonetic representation would show that their modes of spelling were not more ignorant or less ignorant than our own or those of the Anglo-Saxons, their ancestors. The art of printing and the training of eye and ear had not yet brought the world under the rule of uniformity of sound representations. Scribes attempted mainly to represent the oral utterances by characters that, when pronounced, seemed true records of the sound of the voice. That is they, as all Teutonic races for centuries had done, spelled phonetically.

Since one sound or a combination of sounds was represented sometimes by two

or more characters or sets of characters, there existed the forms of spelling that strike us now as systemless or "ignorant," but which were, after all, a constant attempt at correct representation of the voice. For example, to different ears and sometimes to the same ear, "i" and "y," "ai" and "ei," "ai" and "ay," "eir," "elre," "er," "ore," "ear," and "eare," represented respectively the same sound or sounds. So we have in these old manuscripts such variant representations of identical utterances as "is" and "ys," "if" and "yf," "raigne" and "reigne," "said," "sayd," "saith," "saithe," "sayth," "saythe," "saieth," "sayeth," "their," "theire," "ther," "there," "thear," "theare," and so on indefinitely. A glance through Shakespeare's deposition, for example, written by two different clerks, will show a number of such variants in phonetic representation. Even in a manuscript written entirely by one hand you rarely find uniformity. Every searcher of documents will tell you, for example, that he has often found such a simple word as "is" spelled in a single line as both "is" and "ys."

In the matter of proper names we have not even now perfect uniformity. We still meet with "Smith," "Smithe," "Smyth," etc. I have known an American university girl to begin her first semester as "May" and soon evolve into "Mae" or "Maie." In Shakespeare's time, people spelled proper names even less uniformly than now. Philip Henslowe's name, for example, is spelled by him and others some score of ways. The name "Shakespeare" also occurs in a variety of phonetic forms, as "Shakespeare," "Shakspere," "Shaksper," "Shaxper," and so on. The most common contemporary spelling was the one now generally followed, "Shakespeare."

In spelling the poet's name, some wrote the first part "Shake," others "Shak," both of which forms properly represented the same sound of the voice, just as we now find in "take" and "tak-ing." The last part of the name was spelled "speare," "spear," "spere," "sper," all of which forms were only graphic representations of one set of sounds. Those who wrote "Shax" simply combined the k-sound of the first part with the "s" of the second part into "x"—a form of contraction equivalent to "ks."

This brings us to the forms and signs of contraction, which were then in such common use as to make the page present the appearance sometimes—especially in Latin documents—of combined long-hand and short-hand. We still write "Mr.," "Dr.," "St.," and a few others. But we have ceased to use most of the contractions and their signs then so common. For example, we no longer write "othr" for "other," "possion," with a stroke over the top, for "possession," "p'tend" for "pretend," "p'forme,' as in the seventh line of Shakespeare's third answer, for "perform," "thr" for "their," "sp," with a stroke through the stem of the p. for "spear."

In Shakespeare's time, and long before, but gradually less and less since, certain marks or signs of contraction meant regularly certain sounds, just as the letters they stood for did. For example, a little cursive mark running back over a letter, as in "p'tend," where the apostrophe is inserted, meant "re." But a bowl on the front of the stem of "p" made that character represent "pro," and a "p" with a stroke through the lower part of the stem represented "per."

It is extremely interesting to see these contractions and signs used even in proper names. By comparing Shakespeare's six signatures, it will be seen that he spelled his name out in full in only those three subscriptions written in the solemn and deliberate hour of perfecting his will. The name on the first sheet of the will reads "Shakspere," on the second, the same, and on the third, "Shakspeare." "Shak" was the representation he used in all six for the pronunciation of the first part of his name, which was the exact equivalent in sound to the representation "Shake" used by us now, by the clerk of the court in the deposition, and by contemporary publishers and scribes. It is the last part of the name in three signatures that presents shortened forms.

If you examine the purchase-deed signature, you observe the name finished with "spe" and a cursive mark running back over the "e." This cursive is one of the signs used by all scribes of the period to represent the sound we recognize in "re," making the signature, then, read "Shakspere." The signature to the mortgage-deed finishes with "spe" and a mark just above the "e" slightly different from the other, but very commonly used by scribes then likewise for "re." So that signature, too, reads "Shakspere." The eminent Shakespearean scholar, Edmund Malone, who first printed this last signature, 1790, originally interpreted the cursive mark as an "a." He thought the poet lacked room for the full signature, and so wrote as far as he could on the narrow strip of skin, then put an "a" above. He was satisfied, therefore, that the full form was "Shakspeare." Later, 1796, Malone saw he had misinterpreted this common "re" cursive.

The new signature offers another form of shortening. In printing it, I allowed it to stand doubtfully as "Shaks." You will observe on examining it that the final flourish after the "k" has a short turn at the top, with a rapid down-stroke to the left, finishing with a round turn at the bottom and a long, swift cross-sweep of the pen to the stop. If that final character stood alone or as an initial, any one familiar with old records would at once say it was a "p" with a stroke through the stem for "per" or "par," as in "p, forme" in the seventh line of Shakespeare's third answer, or in "p,te" (for "part") in the second line of the fifth answer, and in other words as I have printed them in other depositions. But the signature shows no "s" in front of that flourish. To read it "per" would make the name "Shakper." Since all men then tried to make the letters of a word represent the sounds of the voice, that interpretation cannot be quite correct. Moreover, we have five other evidences from Shakespeare himself, and universal testimony of the contemporaries who wrote his name, that it was pronounced with a sibilant "s" in the middle. The interpretation "Shaks" is also open to objection, even though one of his friends, Abraham Sturley, wrote his name "Shak." There are three sorts of s's used by contemporary scribes. One, a final letter with an upturn, standing for modern "s," was exactly the same as German final "s." Another, standing for our final "es," finished with a down-turn, and looks like a modern "e" with the down-stroke run straight on below the line, as, for example, in "poundes" in the fifth line of Shakespeare's fourth answer. The third was a long "s," always used initially and medially, as shown in "saythe," "bousehould," and numerous other words in the deposition. It generally resembles a modern script "f" stopped short at the bottom, without an upturn. But often, especially in the medial position in signatures, it has the appearance of a long, sweeping figure eight, similar to the flourished character after the "k" in this new signature.

What, then, does this finishing character represent? Clearly, the "shak" is the phonetic representation of the first part of the name. Can this final character, containing features of long medial "s" and the contraction for "per," represent either more or less than the rest of the name? There is, of course, the barest possibility that, in attempting an "s," the unfamiliar clerk's pen in the hand of Shakespeare caught in the paper and made that blot on the "k." But it seems unlikely, for there is no evidence of a stroke, either above or below, that could represent any portion of an "s." If there were, as every one would be glad to find, it would be settled on sight that this final character stands for "per." A contraction is quite common in proper names, and is occasionally found in signatures, as Cow*per*, Ro*per*, Sem*per*, etc. But as the signature stands, it appears likely that this rapidly finished sign of contraction, even though without precedent, may represent simply the sound of the voice in pronouncing the unaccented syllable "sper," which might indifferently be spelled thus, or "spere," or "spear," or "speare," without modification of the pronunciation.

The spelling "Shakespeare," or "Shakspere," or any other of that time, should not cause debate. Scribes then had their ways of representing the sounds of the voice, we have ours. To insist on any one form simply because Shakespeare himself used that form or because some one else used it, is to disregard modern modes of phonetic representation and to substitute for them modes of the past without concern as to whether they correctly represent the utterance of the voice to-day or not. After all, the general public sense shows the broader view. We have stereotyped the form most common in Shakespeare's own day as a preferred spelling mainly because it most nearly represents to us the pronunciation that we give the name.

One other item—touching Shakespeare's possible residence in St. Helen's, Bishopsgate—should here be noticed. Mr. M. S. Giuseppi, of the Public Record Office, who supplied the main data for publication in that matter a few years ago, has kindly called my attention to the fact that the Bishop of Winchester owned no lands in Sussex, and that the record in the Pipe Roll of 1599 concerning William Shakespeare, of St. Helen's, with the note of reference to the Bishop of Winchester against it, must therefore refer only to Surrey, and, more closely still, to Southwark. This being the case, it looks probable that the Shakespeare there named was, after all, the Poet, and that he answered in the Surrey-Sussex residuum, not because he was a resident in Southwark, but because of his ownership of property there, at the Globe theatre. It seems quite possible, therefore, that his residence with the Mountjoys in St. Olave,

Silver Street, began with his removal from St. Helen's, Bishopsgate. But we need more documentary evidence yet before venturing a positive conclusion.

CHARLES WILLIAM WALLACE.

London, March 4.

THE ENGLISH PARTIES.

TO THE EDITOR OF THE NATION:

SIR: A large proportion of those who write on the present English political crisis in the American press incline toward the Liberal party on the grounds that the Liberals stand for popular government as against aristocratic. It is natural that Americans should look with disfavor on an hereditary second chamber and a suffrage limited by property qualifications, but a closer scrutiny of the situation would show the writers in question that their estimate of the Liberal party is theoretical rather than practical.

The Liberal party attacks the House of Lords chiefly because it is a Conservative body. It does not propose to reconstitute the upper house on some principle more just and modern than heredity; it proposes to cripple its power of opposition. The moderate Liberals wish to do away with the Lords' veto on financial measures; the extremists wish to abolish the Lords entirely. Either of these plans tends toward single-chamber government—a principle entirely foreign to American ideas.

It is not as if the House of Commons really represented the British people. A general election is often fought on a single issue; the resulting Parliament, if the Government retains its majority, remains in existence for seven years, and may pass any number of measures on which the opinion of the electorate has not been consulted. At the time of the 1906 election, for instance, the principles of the famous Lloyd-George budget had not been evolved, and only the exercise of the Lords' veto, which the Liberals wish to abolish, gave the people an opportunity to register its opinion. And the people returned an anti-budget majority, for the Irish, although political expediency may lead them to accept the budget in a modified form, are known to oppose it.

It is a very difficult matter to estimate the relation between the opinion of the British public as a whole and the opinion of Parliament. The suffrage is restricted, and the seats are badly apportioned. Too much is made in American discussions on the subject of the influence of plural voting. Many men have more than one vote, but few men actually use their plural votes to the full extent, and the number of plural votes cast in any one constituency is rarely large enough to affect the result of an election. A worse evil is the over-representation of certain country districts, and particularly of Ireland. An Irish member often represents three thousand votes, whereas an English borough member may represent twenty thousand.

The Liberals have talked a good deal about Parliamentary reform, but they have done remarkably little. They are afraid that a reapportionment would injure their own standing. The extreme Liberals and Labor members favor universal suffrage, or at least manhood suffrage, but the average intelligence of the poorest classes in England is so low that the wisdom of such an extension is very doubtful.

The Conservative party believes in a strong second chamber; it wishes to reform the House of Lords without crippling its powers. It realizes the danger of government by a single chamber in power for seven years unchecked by any constitutional restraint—for the King does not exercise his veto, there is no written constitution, and the Liberals wish to remove the only existing check, the veto of the Lords.

From the purely constitutional point of view, the standpoint of the Unionists should meet with more American support than that of the Liberals.

FREDERIC SCHENCK.

THE CORPORATION TAX LAW.

TO THE EDITOR OF THE NATION:

SIR: It is doubtless the opinion of vast numbers of business men, of whom a large number are Republicans, not only that the Corporation Tax law is unbusinesslike and ill-advised, but also that it is unfair to the point of tyranny. It has been attacked in numerous suits brought by many different corporations and persons in many different places, upon various grounds of unconstitutionality. So widespread has the attack been that many persons almost take it for granted that the law will be overthrown by the United States Supreme Court as being unconstitutional. The loss of this law will be a blessing to the country; but how about the loss of President Taft's reputation? His capacity, character, and temperament have been singularly in contrast with those of his predecessor. We have been taught to believe, and have believed, that Mr. Taft is above all a fair-minded man, calm, judicial, and authoritative in matters of law. If this law should be declared unconstitutional, within not much more than the first year of Mr. Taft's term, his reputation as a fair-minded man and a jurist will be swept away; and what will then be left? What subtle force thus drags a great and good man down when he enters public life in this country? Is it not summed up in one word—politics? What is the poison in our politics? The answer is—universal suffrage, destined to crumble and be swept away as an impalpable powder by the irresistible impact of modern evolution. ROBERT S. MINOT.

Boston, March 4.

SHELLEY AND JAPAN.

TO THE EDITOR OF THE NATION:

SIR: An incident of Japanese life may interest readers of the *Nation*. This morning, after breakfast, I was informed that a young Japanese had committed suicide on the beach in front of the hotel. Of course, I walked down to the beach, and there the poor boy lay. The body had to lie there on the sand until a doctor had examined it and the police had inspected it; then it was picked up by a couple of fishermen, doubled up, head to heels, and thrust into a box which was corded up, slung on a pole, and carried off by two coolies. It was one of the most heartless proceedings I have ever seen, and during it all the crowd joked and laughed, and evidently regarded the matter as a very funny incident.

How strange the contrast, when I discovered that before shooting himself, the poor boy had spread out on the sand all his little belongings—less than a dollar in money, a very scanty wardrobe, some paper and pens, and a copy of "The Poetical Works of Shelley."

WALTER ROGERS FURNESS.

Kamakura, January 9.

STATE INTERVENTION.

TO THE EDITOR OF THE NATION:

SIR: The following clipping is from the *University of Wisconsin Press Bulletin*, January 24:

A package of Wisconsin-grown Connecticut-Havana tobacco seed will be furnished to tobacco growers of the State for a trial planting by the Horticultural Department of the Agricultural Experiment Station of the University of Wisconsin. This seed has been selected from the improved tobacco grown at the Experiment Station for several years, and represents the very best product resulting from systematic improvement.

So we have the teachers of the public schools of Wisconsin instructing their pupils, under the compulsion of a State law, in the (presumably) noxious effects of tobacco upon the human system, as also the use of tobacco in public prohibited to persons who have not reached sixteen years, under severe penalities, while the State University is distributing free seed of the best brands—a curious comment on State intervention. F. E. U.

Washington, D. C., March 1.

THE LARGEST GLACIER.

TO THE EDITOR OF THE EVENING POST:

SIR: Permit me to call your attention to a slip in your recent reference (*Nation*, No. 2330, p. 194) to the report on the Alaskan glacier region, to the effect that "the Malaspina, with a surface area of 1,500 square miles, is the largest in the world outside the Polar regions." That is, of course, far from the truth, the Vatna-jökul, in Iceland, containing ca. 3,100 square miles. Strictly speaking, the glacier-cap of Southern Greenland (in the same latitude as the great Alaskan glacier region) would also have to be considered. L. M. H.

Literature.

CROCE'S ÆSTHETICS.

Æsthetic as Science of Expression and General Linguistic. Translated from the Italian of Benedetto Croce by Douglas Ainslie. New York: The Macmillan Co. $3 net.

The *Nation*, having already commented (September 25, 1902), on the Italian edition of Benedetto Croce's important work on æsthetics, can now treat this translation only in a general way. Mr. Ainslie has usually conveyed the sense of his compact original with fidelity and spirit. The theoretic portion is preserved intact, the historical summary of æsthetic opinions has been reduced by two-thirds, retaining, however, the portions

which especially distinguish it from Bosanquet and other compilers. In an introduction breathing a fervid spirit of discipleship the translator describes his meeting with the author. Not uninteresting in itself, it seems to us out of keeping with the dignity of the book. A very welcome contribution not found in the Italian editions is Signor Croce's Heidelberg address on Pure Intuition and the Lyrical Character of Art. The ample bibliography is omitted and, less pardonably, the index. Still, the full table of contents and sidenotes enable one to get about.

Professor Croce is eminently modern in clinging to psychology. For him the æsthetic fact is intuitions that have found expression. This and nothing else is art. But such expression—possession, one is inclined to amend—of intuitions may be, nay, inevitably is, a stage towards intellection. All knowledge has filtered through an æsthetic stage, but the moment our expressed intuitions consent to become terms in concepts, æsthetic quality perishes. It seems to us a defect in the argument that the distinction between such momentary and mediatory expressions and those that are indulged for their own sake, while stated, is nowhere sufficiently ascertained. Expression is a faculty of the human spirit, self-sufficing, unrational, independent of external authority, bearing to intuitions the relation that perception does to sensations.

Such is the doctrine in brief. It resembles the tenets of the psychological school, but is simpler and more comprehensive than any other definition. Véron's dictum that art is objectified emotion, and Santayana's hedonistic variant—art is pleasure objectified, obviously are included within Croce's more sweeping generalization. Only the Neapolitan critic would insist that pleasure is merely a possible concomitant either of intuitions or of their expression.

We suppose few writers to-day would, except by avowed metaphor, locate beauty in things. Our author takes beauty to be successful expression, or more simply expression. Beauty is absolute and has no degrees. Ugliness is merely unsuccessful expression. In a work of art of complicated structure beauty may be in the parts and not in the whole, as freshness graced only fractions of the modest parson's egg. The criterion of art is solely, Has an intuition or intuitions been expressed? No moral or intellectual judgment of the intuitions themselves is in order, for we are in a purely theoretic realm of vision and contemplation, where the will does not enter, and consequently morals are in abeyance. We are evidently not far from the *Urteilskraft* of Kant, freed of mystical implications. When, however, an expression—an inner operation of spirit—is externalized in a work of art, then morals and politics have their right of self-protection. The silent expresser has chosen to become a doer, and his deed is a social fact, subject *quâ* art only to the requirement of expression, but otherwise subject, like other social acts, to discipline, or even suppression.

> We cannot will or not will our æsthetic vision: we can, however, will or not will to externalize it, or better to preserve and communicate, or not, to others the externalization produced.
>
> This will to externalize is the only thing that distinguishes the artist from the man of taste.
>
> The judicial activity, which criticises and recognizes the beautiful is identical with that which produces it. The only difference lies in the diversity of circumstances, since, in the one case, it is a question of æsthetic production, in the other of reproduction. The judicial activity is called taste; the productive activity is called genius . . . [which are substantially identical, since] to posit a substantial difference between genius and taste, between artistic production and reproduction, would render communication and judgment alike inconceivable.

The passage illustrates at once Signor Croce's vigor and the stride with which he takes the wider gaps in his argument. He fails to allot to memory its preponderance, both in taste and genius. As for beauty, since it does not inhere in things of any sort, it obviously cannot be an attribute of nature.

> Natural beauty is simply a stimulus to æsthetic reproduction which presupposes previous production. Without preceding intuitions of the imagination, nature cannot arouse any at all.

Here we are near Oscar Wilde's paradox that beauty is conferred upon nature by art, a suggestion which might claim respectable Platonic origins.

It follows from the definition of art as expressed intuition that all classifications of the separate arts are merely descriptive, historical, unscientific, and in a sense provisional. The famous *genres* have thus only empirical existence. Any attempt to fix their limits and to legislate for future art is absurd *ab initio*. The reprehended tendency to *Anderstreben* is the natural and legitimate attempt to secure the maximum of expressiveness. Where we imagine we are laying down the laws of the *genres*, we are either talking nonsense, or merely asserting that a given expression is intrinsically insincere or imperfect.

Such is the doctrine in bare epitome. Its interesting working out in the field of history and belles-lettres, we can only mention. The most novel feature of the book, though anticipated by the impressionistic critics, is the awarding of equal honors to criticism and so-called creation. Without a vigorous criticism, not necessarily a written one, Signor Croce believes no vigorous art is possible. In this conviction, he has founded and conducted that very able review *La Critica*.

Remarkable and trenchant as are the affirmations of this book, its silences are equally significant. Rarely has an æsthetic been written with such slight attention to the concrete arts, or, in our author's phrase, externalized expressions. Some hint of the qualities of the arts of language there is, but music, painting, sculpture, the dance, hardly shadow these pages. All this is consonant with the dictum of the indivisibility of æsthetic expression, but it also causes misgivings. Finally, though any thorough discussion of the theory is impossible, we may at least mention the gravest doubt that occurs. These intuitions, which are the plasma of expression, what are they? The answer is very brief and vague, negative rather than positive. We are told that these are inchoate non-intellectual experiences that either through expression become æsthetic or fail of expression and remain inchoate. But suppose these intuitions are so diverse inherently that the process of expression fails to unify them? May there not be, in short, paths to intellection that forego the æsthetic stage, intuitions refractory to æsthetic expression? Such questions occur and we find no complete answer to them. A deeper doubt arises from the fact that the whole argument really adds nothing to the initial definition—art is expressed intuition. One shrinks from a system that is already complete in a definition involving a mystery.

Of the value of the book, there is no question. Its destructive analysis of the empirical, naturalistic, and transcendental æsthetic is enlightening and convincing. It clears the ground for constructive studies. It is written with superb clearness, vigor, and picturesqueness. Any reader who is capable of consecutive thought may understand it, and will not fail to find it immensely stimulating. These are distinctions that cannot be taken away from this athletic Neapolitan thinker whatever fate the future may hold for his doctrines.

CURRENT FICTION.

The Human Cobweb: A Romance of Peking. By B. L. Putnam Weale. New York: Dodd, Mead & Co.

Mr. Weale will be recalled as author of "The Re-Shaping of the Far East," "Indiscreet Letters from Peking," and other books dealing with modern conditions in Eastern Asia. He has also published a collection of short stories whose scene is laid in the Far East. The material for "The Human Cobweb," which is, we believe, his first novel, is drawn from the same source. The action begins in London, but, most of it, as the sub-title suggests, takes place in Peking.

The hero, Peter Kerr, is a rising engineer who has planned a system of railways in China which shall assure England of permanent influence in Chinese affairs. Of course, he tells a woman all about his plans before he leaves England, and, of course, she betrays him. When he arrives in Peking to begin his experience as concession-hunter, a certain Belgian syndicate, in full possession of his plans, has its representatives there and already at work to secure control of the territory involved. Peter Kerr has been allowed by his sponsors to set out on his mission in complete ignorance of the ordinary mode of procedure in such cases. He is astonished to find difficulty in approaching the Chinese official by direct means. However, he has the good luck to fall into the hands of an Italian concession-hunter who thoroughly understands the game, and who eventually engineers him to success. But he also falls into the hands, or, more literally, the arms, of a Frenchwoman whose husband is working against him for the Belgian syndicate. Much complication ensues, and the ingenuous Peter is finally extricated only by the amazing skill of his Italian ally.

It must be admitted that the Englishman does not play the part of conquering Briton with the aplomb of the ordinary hero of fiction. The Italian adventurer, the Swiss landlord, above all the extraordinary little Englishwoman who somewhat spasmodically mothers him in his exile, are all more interesting persons. Mr. Weale has a straightforward style, and a knack at mild philosophizing which remind one a little of the late Marion Crawford. So, in noting the physical sloth of his fat Italian:

> It is not all people who find happiness in perspiration; some prefer pantology; others revel in pantophagy; not to speak of those who never find happiness at all.

Characteristic, too, is his description of a hotel as

> curiously like a box full of different compartments, containing different kinds of insects, engaged in their own work. Separated only by lath and plaster, some are doing one thing, some another thing, and some nothing at all. Imagine how amusing it would be if one could get a simultaneous view of the manifold activities!

In his panoramic views of Chinese life, and his interpretation of them, the student of the East triumphs over the novelist: it is in these passages that the book achieves absolute merit.

On the Branch. From the French of Pierre de Coulevain. By Alys Hallard. New York: E. P. Dutton & Co.

This is currently described as the most popular book of the moment, in France; as the most popular of all books written by women. Let us "allow for the wind," as some one advised the reader of Hazlitt to do.

The heroine of the tale, who tells her own story, is a woman in her fifties, a Mme. de Myères. Late in life, she has blossomed out into literature. As "Jean Noël," she is a successful novelist. ("Pierre de Coulevain" is, no less, a woman's pseudonym. This is not the only analogy.) At the opening of the story, this heroine is a widow of tragic experience. After fourteen years of life with a husband, whom she had greatly loved, the husband has suddenly been lost to her, and, with his death, it has appeared that a friend of her childhood has been his mistress; also that there is a child. This highly introspective woman, whose narrative is more thickly sprinkled with the personal pronoun than any we have recently encountered, is deprived even of the luxury of grief. In her bereavement and disillusion she decides upon cutting loose from all ties with the too odious past. She seeks relief in travel. She lives "on the branch"—in hotels and strange places. In her peregrinations, she heaps up (to use her own phrase), "impressions upon impressions, images upon images." These impressions, these images, form the staple of a book that fairly reeks with cosmopolitanism, with analysis, and with a kind of leucocholy that passes off as optimism. For Jean Noël professes belief in some sort of providential fatalism, which seems to strengthen her against the slings and arrows. It is difficult to disentangle the Jean Nöel and the Pierre de Coulevain here; one or the other of them prates overmuch of this same "Providence"; of personal magnetism; of "fluids." Unquestionably the "human interest" of a really moving story loses, too, by the deliberation with which it is unfolded. In the end, however, Mme. de Myères—or Noël—becomes reconciled with her husband's mistress and comes even to love her and her son. She interests herself in the latter's love affairs. The final words of the book are, "Fallen from the Branch."

The Crossways. By Helen R. Martin. New York: The Century Co.

The picturesque life of the Pennsylvania Germans is a field so well known to this writer that her mastery of local color is to be taken for granted. In her present book, however, the characters who play their parts before the beautifully painted scenery do not appeal strongly to the average reader. By those who delight to dwell upon the condition of woman as the bondslave of Man, this story may be hailed as profoundly symbolic; but to the ordinary mind its pivotal point is inconceivable, even though it may be founded on the facts of life among a fortunately limited number. The story turns upon the mediæval relations between man and woman still current in a community where it is not only possible, but customary, for a man to consider the women of his household as mere drudges and chattels. The son of such a family, Matthew Kuntz, has made for himself the promising beginnings of a career as a doctor. In his hospital practice, he has fallen in love with one of his patients, a beautiful Southern girl, whose natural sensitiveness has been fostered by her tender rearing. She marries him despite the protests of her family, and is happy till their return to his native village, where he has decided to establish his home. Once in the atmosphere of his father's house, he succumbs to its traditions. Instead of the comradeship of their earlier days, he feels the need of asserting his mastery; and although poor Jean is no shrew, he proceeds to her taming by methods hardly more gentle than Petruchio's. The breaking of a butterfly is always a sorry spectacle, and we are wearied and disgusted by the long drawn out story of Jean's sordid martyrdom. Of course, the birth of her child is supposed to work a revolution in Matthew's ideas—but the change treads somewhat too close upon the heels of his previous blind brutality for us to find it convincing. We rather echo in thought Tom Kemp's comment on the reformed Mollusk. "It's a miracle—yes; but are miracles permanent? We're never told—we're never told."

Little Brother O' Dreams. By Elaine Goodale Eastman. Boston: Houghton Mifflin Co.

This slight but exquisite portrayal of the heart of a child has the charm of a bluebird or a butterfly—a brief gleam of grace and color that leaves a pleasant memory. One might perhaps wish away the final touch of conventional romance, and yet it does not mar the atmosphere of the story, for the reunion of Little Brother with his Princess seems as far from the strident realisms of commonplace fiction as the nuptials of Peter Pan and Maimie Mannering. It is in Little Brother's poems that the soul of the book is to be sought. Such lines as the couplet on Sunset and Autumn have some spark of the right Promethean fire:

> On the castle of Night a red red flag that flies for the prince Tomorrow;
> In the face of the Cold a blazing world, and Hope at the door of Sorrow.

This verse to the chimney-swallows has also a haunting music:

> Why do you live in a small dark room, you children of air and light—
> In a house that is tired and old and sad where men have been born and died?
> If I were a bird I would live like a bird on the highest wind-washed height,
> In the bending tip of the topmost tree where the heavens are opened wide.

Best of all is this summary of the child-poet's philosophy:

This world is all a Poem, braided lines
like sun and rain;
Winter is the rhyme to summer, joy is
always rhymed with pain.
Youth and age are in the poem—you can
hear it if you try—
If you listen in a lonely place—a-swinging
through the sky.

God is the wondrous Poet who matched
the day and night;
He made your heart to answer to some
other in his sight.
He scatters tears and laughter, he plays
with life and time;
He gives you half the stanza—but you
must find the rhyme.

REMINISCENCES OF A SOUTHERN LADY.

My Day: Reminiscences of a Long Life. By Mrs. Roger A. Pryor. New York: The Macmillan Co. $2.25 net.

Mrs. Pryor is decidedly the mistress of feminine Southern reminiscence—and we do not mean the title to suggest the sarcasm that dubbed Mrs. Malaprop Mistress of the Dictionary. If there are any two people now living who can recall personally more of what was characteristic and stirring and interesting in the life of the South during its most absorbing period than Gen. and Mrs. Pryor can, we should be at a loss to name them; and if there is any woman who can write of that time after a fashion at once so thoroughly Southern and so free from bitterness as Mrs. Pryor, we have not chanced upon her book. This is Mrs. Pryor's second volume of memories; and we cannot wonder that she has written twice—with such a life to write about. There is, of course, some repetition, since she here deals with the same years, the same scenes, and to some extent the same people, with which she dealt in her "Reminiscences of Peace and War"; but the supply of incident is not scant, the years and the people remain interesting. From the flower-gardens and serenades and old-fashioned gentilities of a Southern girlhood before the war to Washington and Richmond on the eve of the conflict, then through the very midst of the struggle, with its early triumphs, its growing gloom, its final supreme and lengthened agony at Petersburg, and then on into the new day of heroic rebuilding, regrowth, reconciliation—this is the course Mrs. Pryor leads her readers; for this has been the course of her life. To such a narrative it is hard to see how any American can be quite indifferent.

And it is all prattled out with a naïveté, a zest, a now conscious and now unconscious humor, a disregard of historical proportions and dates, and a piling up of praises and appreciations, such as only a woman of the old Southern tradition could possibly put into a book. One simply cannot conceive of a New England woman of Mrs. Pryor's class pouring into print such eulogies of her husband and children and other kinsfolk; yet somehow from Mrs. Pryor's pen they do not come amiss, and they will hardly be taken amiss. Until another Thucydides shall make the unlikeness of the Southern and the Yankee temperament as plain as the unlikeness of Athens to Sparta, such things will remain puzzling.

Yet from such utterly feminine things as these, and from countless enumerations of dear and cultivated and gracious women and adorable children and superb men, Mrs. Pryor can pass into narratives of suffering and heroism that are admirably simple and convincing. All culminates in her story of the Petersburg siege, from which one rises with no feeling but admiration and sympathy. As time goes on, all Americans will grow prouder and prouder of that story of unsurpassed fortitude and endurance; and no telling of it will be complete without such touches as Mrs. Pryor supplies. Here are glimpses of Lee and others of the Southern leaders that will stay in the memory; and other ghastlier sights as well. This, for instance, which Mrs. Pryor saw one horrible night, just after Petersburg fell, which she spent with her children in a ruined and filthy farm-house, surrounded by strange negroes:

> With untroubled consciences my children were sleeping. It was so dark in the room I could not see their faces, but I could touch them, and push the wet locks from their brows, as they lay in the close and heated atmosphere.
>
> I resumed my watch at the window, pressing my face close to the slats of the shutters. A pale half-moon hung low in the sky, turning its averted face from a suffering world. At a little distance I could see the freshly made soldier's grave which Aleck had discovered and reported. A heavy rain had fallen in the first hours of the night, and a stiff arm and hand now protruded from the shallow grave. To-morrow I would reverently cover the appealing arm, be it clad in blue or in gray, and would mark the spot. Now, as I sat with my fascinated gaze upon it, I thought of the tens of thousands, of the hundreds of thousands of upturned faces beneath the green sod of old Virginia. Strong in early manhood, grave, high-spirited men of genius, men whom their country had educated for her own defence in time of peril—they had died because that country could devise in her wisdom no better means of settling a family quarrel than the wholesale slaughter of her sons by the sword. And now? "Not until the heavens be no more shall they awake nor be raised out of their sleep."

When one has read all that she and her children endured while the war lasted, one is ready for an end of horrors and sufferings; but there were yet to follow years of extreme hardship and poverty, while Gen. Pryor slowly forced his way into a new career as a lawyer in New York city. It is a record to make one hesitate before saying a light word even of the "fire-eaters"—for in the fifties Gen. Pryor was regarded, the country over, as hardly second in that rôle to Yancey himself.

His and Mrs. Pryor's close associations with famous contemporaries have been extraordinarily numerous and diverse. There was Stephen A. Douglas, whom Pryor once seconded in a duel; William Walker, the filibuster chieftain, whom they entertained on the eve of his departure for Nicaragua; Lewis Cass, who came to their house in Washington late one night at the end of 1860, an old man of seventy-seven, bundled up in shawls and scarfs, and implored Pryor to do what he could to save the Union; Davis and many other of the foremost Confederates; Lincoln, whom Pryor, a prisoner on parole, saw at the White House in the winter of 1865; and finally, after the war, Grant and Sherman and Sheridan and other of the captains of the Union. The striking anecdote is never wanting about any one of them; and Mrs. Pryor is too good a Virginian to let it lose anything in the telling. Sherman alone comes in for reproach, and in this, it must be confessed, Mrs. Pryor is not unrepresentative of even the most liberal Southern opinion.

But the book is not all about soldiers and warfare—far from it. The closing chapters, for instance, are full of very recent New York; and there is, throughout, plenty of lightness to relieve the gloom. One of the best stories is this, of G. P. R. James, the English romancer, whom the Pryors knew in Washington before the war:

> One day he dashed in, much excited:
>
> "Have you seen the *Intelligencer*? By George, it's all true! Six times has my hero, a 'solitary horseman,' emerged from a wood! My word! I was totally unconscious of it! Fancy it! Six times! Well, it's all up with that fellow. He has got to dismount and enter on foot—a beggar, or burglar, or peddler, or at best a mendicant friar."
>
> "But," suggested one, "he might drive, mightn't he?"
>
> "Impossible!" said Mr. James. "Imagine a hero in a gig or a curricle!"
>
> "Perhaps," said one, "the word 'solitary' has given offence. Americans dislike exclusiveness. They are sensitive, you see, and look out for snobs."
>
> He made himself very merry over it; but the solitary horseman appeared no more in the few novels he was yet to write.

Woman's Work in English Fiction. By Clara H. Whitmore. New York: G. P. Putnam's Sons. $1.25 net.

This book begins with the Restoration and ends in the mid-Victorian period, embracing feminine contributors to fiction from the Duchess of Newcastle to Mrs. Gaskell. It will occur to most masculine readers that the writers of importance here considered have been treated more fully and adequately elsewhere. But the courteous critic will

keep that thought to himself, and cordially acknowledge that the point of view, the exclusion of men, and the impressive array of obscure notables—Mary Manley, Charlotte Lennox, Frances Sheridan, Catherine Grace Frances Gore, and the rest—give to Miss Whitmore's history something of the piquancy of "Cranford." At the same time, the work is not mere graceful semi-biographical gossip like Miss Repplier's charming "Happy Half-Century." It aspires to be a serious, continuous, and, indeed, contributive literary estimate, and as such it is open to criticism.

Miss Whitmore's most fundamental weakness as literary historian is a kind of transcendental indifference to chronology. She is bent on proving the priority of women in making all sorts of valuable innovations in fiction, and yet she discusses tendency after tendency through page after page without a date. Consequently her book bristles with terribly questionable "first appearances." For example, after quoting a passage from Mrs. Smith's "Old Manor House" (1793), she declares her the inventor of natural landscape—"such descriptions are not unusual now, but they were first used by Charlotte Smith." Again, of Mrs. Inchbald's "A Simple Story" (1791) she says, "It is the first novel in which we are more interested in what is felt than in what actually happens." One is tempted to call up the School Boy and ask him if he has ever heard of "The Man of Feeling." *After* Horace Walpole, two women, Clara Reeve and Mrs. Radcliffe, do seem for a time to take the lead in Gothic romance; but in assigning credit for new qualities in the fiction of the late eighteenth century Miss Whitmore, ignoring the time-spirit, frequently mistakes the general romantic and revolutionary liberation of emotion for a distinctly feminine impulse.

To be both critical and human is difficult, and Miss Whitmore is human. For the present purpose, perhaps, she has chosen the better part. After all, who cares for a critical account of the Duchess of Newcastle? "Her plays were well received," says our admiring and sympathetic author, and "No one can read this biography ["Life of the Duke of Newcastle," by his wife] without feeling the charm of the quaint, childlike personality of the Duchess of Newcastle." If any one desires another estimate of this lady's talents, he has only to open Pepys's "Diary" at March 30, 1667: "To see the silly play of my Lady Newcastle's called 'The Humourous Lovers'; the most silly thing that ever came upon the stage. I was sick to see it, but yet would not but have seen it, that I might the better understand her"; and on March 18 of the following year Pepys expressed his opinion of her biography, "which shows her to be a mad, conceited, ridiculous woman, and he an asse to suffer her to write what she writes to him and of him."

If this case is at all typical, we have much to learn from feminine critics. Certainly Miss Whitmore is most entertaining when she consciously clashes with man-made reputations—when she declares that the plot of most of the fifteen realistic novels of Richardson, Fielding, Sterne, and Smollet is "practically the same," and expresses her contempt for their coarse subject matter, or when she wonders whether Harry Fielding regaled Mrs. Fielding "with the scenes he has described for his readers" and the sights he saw on his travels. "Probably," is her delightful conjecture, "when she asked him if anything had happened *en route*, he merely yawned and replied, 'Oh, nothing worth while.'" To do her justice, however, we must add that she finds even in Fanny Burney a certain antique and obsolete harshness: "Too often the laugh is at another's discomfiture, and so fails to please the present age with its kindlier feeling toward others." With Tolstoy on one side and Woman on the other, alas, who shall be saved?

Despatches from Paris, 1784-1790. Selected and edited from the Foreign Office Correspondence by Oscar Browning. Vol. I: 1784-1787. Camden Third Series. XVI. London.

From the papers of the Foreign Office in London Oscar Browning has edited for the Royal Historical Society a series of dispatches sent from Paris by the Duke of Dorset and other British ministers in France which are of the utmost interest. Unlike private correspondence, official dispatches are generally concise in form and temperate in tone, and in the cases before us the editor has wisely eliminated such portions of the letters as are of minor interest. The result is the equivalent of a running narrative of events, absorbing in the very simplicity and directness with which the great issues gradually appear and disappear and then appear again, rushing forward to a culmination. The climax is not reached in this volume, but the preliminaries are here, and though on the part of the British ministers there seems to have been no expectation of the great crisis to come, the mutterings of the storm can be distinctly heard. During 1786 the correspondents saw little but "perfect and profound tranquillity"; yet by the summer of 1787 "the disorders of the kingdom" had become so manifest that, despite the known opposition of the King which Hailes believed would bring the scheme to naught, the opinion gained ground that only a National Assembly could remedy the existing discontent.

Admirable pictures are given of the Assembly of Notables and its work, of the policy and independence of the Parlement of Paris, of the actions of other of the French Parlements, and of the recently summoned Provincial Assemblies, which Dorset thinks "are likely to be of great benefit to the nation," if only "the principle of liberty upon which they are founded" does not "extend itself beyond the bounds prescribed by the monarch." The first mention of the States-General is in Dorset's dispatch of July 12, 1787, referring to the meeting of Parlement of July 6, when "several of the members spoke with great freedom and twelve of them were of opinion that the States-General ought to be summoned at a conjuncture so critical as the present."

Among other interesting matters referred to in the earlier part of the volume are: the demand made by the Emperor for the opening of the Scheldt to Austrian vessels, in 1784 and 1785, a demand which troubled England very little at that time, though made a pretext for war when presented by France in 1792; the building of the harbor of Cherbourg, at an enormous expense and among many doubts of the practicability of the scheme, doubts that Napoleon was to set at rest forever, twenty years later; the early aviation projects of the Montgolfier brothers, who, declaring that they had learned how to steer their balloon, proposed at this time to open a regular traffic between northern and southern France, freighting their balloon with plate glass on the southern journey and with reams of paper on the return.

References to the United States are numerous, in some instances contributory to our knowledge of the period, and, in others, perhaps, contributory to our knowledge of ourselves. In the second class may be placed the following comment upon the badge of the order of the Cincinnati:

> It is a Blue Ribband, with a golden Eagle enamelled hanging to it, and worn at the button hole: the Motto on one side is, Omnia reliquit servare Rempublicam; on the reverse, Societas Cincinnatoria, and some other words, for which a boy of ten years old would have been flogged at Eton or Westminster.

The minister who wrote this had to take his turn at the game of repartee, when, in 1787, during a discussion of the proposed *Timbre* or Stamp Duty, a member rose in Parlement and said that M. de Calonne, who proposed the tax, "ought not to have so soon forgot that it was a Stamp Act, which occasioned America to shake off the yoke of the Mother Country," a remark which Dorset thought "highly indecent."

The most valuable piece of information furnished by these dispatches is one touching matters of trade and finance. Hailes's long letter of October 25, 1786, is a commentary showing considerable insight into the financial sit-

nation of France: the extravagances of the court, the prodigality of the department of finance, the heavy and largely unsuccessful loans, the expenses of Cherbourg, and the immense works carried on in all the royal houses. Dorset elsewhere confirms the statements of his inferior. In considering French finances, the ministers are naturally drawn on to discuss trade and commerce, and endeavor to show how entirely the French missed their object in taking part in the American war. Hailes thought this object to have been the dividing with England of the commerce of the New World, for he cannot believe that "an enlightened and politic nation would have precipitated itself into a distressing and bloody war without hoping some more substantial advantages than the glory of rendering America independent." He declares that French trade with America after the war was so inconsiderable as to be unworthy of mention, and that, taking all the circumstances together, France had been as great a sufferer by the war as had Great Britain. Dorset's statement that since November, 1783, not one American vessel had been seen at Bordeaux, Marseilles, or other ports of the south, and that exportation to the West Indies had entirely ceased, is important from the standpoint of French revenues, but it is equally important from the standpoint of American trade in the early years of our country's independence. If Great Britain continued to monopolize American trade after the navigation acts ceased to apply to American commerce, and there is evidence elsewhere to corroborate Dorset's statements to that effect, then we may well believe that, contrary to the commonly received opinion, these same navigation acts did but little during the colonial period to hinder our commercial development.

The Relations of the United States and Spain—Diplomacy. By French Ensor Chadwick. New York: Charles Scribner's Sons. $4 net.

With singular fairness and dignity Rear-Admiral Chadwick has written the story of all our dealings with Spain. One may or may not accept his thesis that the Cuban war was written in the stars, but if the theory is to be refuted, the objector will not need to go beyond this book, so full is its documentation and so transparent its presentation of all matters of fact.

Spanish claims have been a sort of byword for more than a century, but the record of such negotiation and litigation is without wide significance. The real points of diplomatic debate between the United States and Spain have been the boundaries of Louisiana and the status of Cuba, although the recognition of the Latin-American republics has had, in the Monroe Doctrine, a more stately reverberation.

Naturally, the keenest interest attaches to the account of our dealings with Spain regarding Cuba. On the whole, the record does us credit. Spain during the half century of dispute persistently preferred *pundonor* to the real issue, whatever it might be; her agents readily committed stupid, provocative, and even sanguinary acts, which were grudgingly disavowed. A characteristic instance of Spanish myopia was the Virginius affair. The real point that horrified the world was the judicial massacre of a shipload of men. Spanish diplomacy, ignoring this moral issue, spent itself in tedious query as to the status of the ship. Were her American papers valid? In fact, the general course of Cuban negotiations suggests that the Foreign Office of Madrid, with all the sensibilities of a *caballero*, too often possessed the soul of a notary public. In striking contrast with the spasmodic conduct of Spanish negotiations is the firmness and moderation of such Secretaries of State as Hamilton Fish and Richard Olney. Either Grant or Cleveland, Admiral Chadwick thinks, could have brought on war by yielding to popular pressure and laying the Cuban matter before Congress. This was what President McKinley chose to do at the precise moment when his diplomatic battle was won.

Among the tragic malarrangements that abound in history, is there one more pathetic than the last days before the Cuban war? General Woodford, at Madrid, had most painstakingly opened the short-seeing eyes. A Ministry was in power that perceived the hopelessness of the Cuban situation and would go all lengths in concession. The Queen was actively enlisted on the side of peace. The seriousness of the emergency had at last found Spanish statesmen who could rise above *pundonor*. At this moment the very slightest grace from America might have secured peace with honor. But the indispensable element of time was lacking. The Spanish Ministry, in an inflamed state of public opinion, dared not go fast on the road of concession, and Mr. McKinley, for a similar reason, dared not be backward in demanding. At a certain point we have the tragic coincidence of the diplomatic battle wholly won at Madrid and the mind of a humane and Christian President suddenly fixed upon war as the only solution. A full week before the Presidential message which meant war was read to Congress, Mr. McKinley knew that through the mediation of the Pope the Queen would grant an unconditional armistice—the main issue of contention. Minister Woodford was confident that this meant peace. Mr. McKinley made a short, cold, and evasive answer to the overture, and finally appended to his message a vague, misleading, and slurring reference to the matter. Spain, who, for the sake of peace, had thrown herself on our mercy, was represented to Congress as incorrigibly obstructive, and war ensued.

Admiral Chadwick, who treats this episode almost without comment, has nothing to say except that the surrender came too late. Indeed, it may have been merely a straw, but it is a straw at which Grant or Cleveland would have grasped. What induced Mr. McKinley to fail to play the last card for peace is still matter of conjecture. It may have been the sinister influence of the senile and prejudiced statesman nominally in charge of the State Department. One may imagine financial interests, whose influence had ruled in Cuban matters, having bound Mr. McKinley irrevocably to a war. But we must not over-indulge mere surmise. It is possible that the explanation is simpler. The chagrin at finding that an unexpected move of the opponent has made waste-paper of a momentous document—such reasons have often provoked an exaggerated stubbornness, both in scholars and statesmen; mere inertia—the inability to revise a strenuous decision—counts for much. So apparently alien a motive as the resentment of a good Methodist at Papal interference is not to be utterly dismissed. But behind any of these possible motives lies Mr. McKinley's temperamental inability to distinguish between the voice of the people which is the echo of base journalism and the voice of the people which is also that of God. The struggle may or may not have been inevitable; but history can never clear Mr. McKinley's memory from the disrepute of casting upon the tender mercies of an inflamed Congress, and there misrepresenting, a generous nation which had made every concession ever demanded by his predecessors or by Mr. McKinley himself.

Points of special interest in Admiral Chadwick's able review of the Cuban imbroglio are his equitable partition of the blame for the awful state of the island between Spain and the insurgents, and his conviction that the Maine was blown up from outside. Cuba was a hell, but the insurgents had willed it to be so. The Spanish repression did not disregard the laws of war, but simply used the stern measures dictated by a desperate situation. It is time that these truths should be said by authoritative lips. Admiral Chadwick's view of the Maine disaster is weighty, for he now tells that he went to Havana as a commissioner expecting to find evidence of an internal explosion.

Without falling back too complacently on fate or providence, it is fair to recall the broader moral issue of Cuba. The island, from whatever cause, was a moral offence and a permanent peril to us. The obvious responsibility for an intolerable state of affairs lay with Spain. Our people, if the viler journalism and the horrible fate of the Maine

counted for much, were also greatly moved by a genuine and worthy compassion for suffering, and by a real if perhaps excessive moral indignation. It is true that in Mr. McKinley's time the negotiations were often conducted with small regard for Spanish sensibilities—Mr. Woodford's local dealings being in honorable contrast to the temper of his home advices; but it is also true that for a quarter of a century Spain had signally failed to understand the disinterestedness and moral righteousness of the American attitude. Until too late she regarded every plea for humanity as if it were a routine move in a sharp political game. If Mr. McKinley treated the overture of the Queen with wilful or ignorant disregard of its import, a similar fate had befallen a score of similarly humane representations from Washington in time past. This does not excuse Mr. McKinley, but it may help rehabilitate that Providence which, if it has indeed directed the dealings of Spain and the United States, has surely had its slumberous intervals. The broader moral of this excellent book is the duty that nations have to understand each other.

The Medici. By Col. G. F. Young, C. B. With portraits and illustrations, in two volumes. New York: E. P. Dutton & Co. $8 net.

This well-printed and fully illustrated work is, we believe, the first that gives the whole history of the Medici family, and with this statement any specific merit is acknowledged once for all. Col. Young is a diligent but rather undiscriminating compiler. All authorities seem to look pretty much alike to him. His style is usually without grace or motion, and he lacks the gift of articulating quoted passages with his own text. Still the book gains in dignity and skill as it goes on, and the lives of the later Medici begin to reveal some of the gifts of the philosophical and literary historian.

On the narrowly historical side the work is adequate. One may feel that the lives of the older Medici have been told many times and better, but the plan of the book required a repetition that is not wholly vain. On the side of the history of art, the author indulges a tendency to link all important pictures with current events. Here he frequently gives his unsupported inferences the weight of facts. In particular his exposition of the pictures of Botticelli plays havoc with the chronology of that artist as ascertained by the study of his style. Still there are suggestive contributions in this matter. Col. Young shows that Mr. Herbert Horne's theory that Botticelli's Spring and Venus were painted for the Villa of Castello, owned by Lorenzo di Pierfrancesco de' Medici, rests on an unproved assumption, and he draws an interesting analogy hitherto overlooked between the title of the Primavera and Lorenzo the Magnificent's motto in the joust of 1475—*Le temps revient.* All this matter still awaits a final interpretation. Col. Young is more prolific in queries than in solutions.

The very full illustration of these volumes, especially as regards portraiture, is an attractive feature. In some cases, the author is careless in accepting bad traditional attributions; elsewhere, he offers inferior posthumous effigies when life portraits are to be found in the fifteenth century paintings; but in the main this is a remarkable pictorial chronicle of a family whose faces are treasure-trove to the physiognomist.

Clearly the most interesting part of the work is that devoted to the later Medici. The services of the inexorable Cosimo I to art and commerce are, perhaps, fairly well understood, but who realizes how much the galleries of the Uffizi and Pitti owe to those admirable brothers Ferdinando II, Giovanni Carlo, and Leopoldo? What enthusiast grasps the fact that, on the dying out of the line, but for the liberality of the Electress Anna Ludovica, the chief treasures of the Uffizi, Pitti, Bargello, Archæological Museum, and National and Laurentian Libraries, might have been dispersed? It was she who dedicated them formally to Tuscany and to the world. In fact, the persistent strain in the stock was the love of art and scholarship. Long after priestly tutors had emasculated the line, they remained enlightened patrons of literature, art, and science. This is their enduring glory, for what the elder Medici and the ruthless Cosimo, Grand Duke, achieved in a political way soon crumbled. No lasting political fabric could be reared on the shifting sands of the Florentine temperament.

Col. Young is the avowed apologist of the Medici, at times beyond discretion. We agree with him that no member of the family ever destroyed any liberty that was worth respect. Except for Cosimo I, the greatest of the race ruled by consent of the people. It is well also to dispel the false impression that the Medici were monsters of vice. As the times went, they were, for the most part, rather scrupulous folk, both in their public and private morality. Yet it evinces either ignorance of the facts, or lack of judgment, to say that the licentiousness of Shakespeare's works and of Lorenzo de' Medici's is on a par. We can only conclude that our author knows the Magnificent Lorenzo in discreet selections that exclude his frank pornography. One could wish that this laborious work had been done with greater scholarship and literary tact. As it is, its completeness and convenience for reference are likely to insure it popularity.

Around Afghanistan. By Major de Bouillane de Lacoste. With a preface by M. Georges Leygues. Translated from the French by J. G. Anderson. New York: D. Appleton & Co. $3 net.

This is a record of the author's fifth journey in Asia. The circuit of the forbidden territories of the Amir of Kabul was made by going on the Transcaspian Railway to its eastern terminus and thence across the Pamirs, or "Roof of the World," over the Himalayas at the Karakoram Pass into Kashmir. Northern India was traversed by rail, and then came the desert regions of Baluchistan and the fluvial oases of Persian Seistan. Major de Lacoste writes in an entertaining way of the various noteworthy incidents of his journey, and describes vividly the striking characteristics of the life of the people whom he saw. But a large part of the countries traversed partook of the nature of the Pamirs, the first impression of which was "a cold and dismal solitude. The earth is bare, the sky void. A continuous wind which whistles lugubriously, sweeps everything on its way, and raises in blinding columns a coarse sand which darkens the horizon. Nothing exists, nothing lives." In view of this, it is hardly surprising to read that in the similarly denuded and desolate plains of Baluchistan, where in ancient times famines occurred every five or six years, the natives built their houses of uncemented stones with a cupola supported by a central pillar, fashioned to a point at both ends. "When the famine became such that it was no longer possible to live, the head of the family assembled all who were in the house around the fragile pillar, then he would call upon the superior divinities, and putting his shoulder to it, like another Samson pulling down the house, he buried under the brutal heap of granite his smiling descendants, whom he thus sent to appease their hunger in eternity."

A novel invention of a Baluchi was the making "in the moist sand a little tunnel ten centimetres long, at one end of which I saw him put a pinch of tobacco, which he lighted; then, stretching himself on the ground, he placed his lips at the other end, and made a long inhalation of warm smoke. Our interpreter, who had no more cigarette paper, had just invented the desert-pipe."

Georges Leygues, member of several French Ministries, introduces the book to its readers with an appreciative preface in which he discusses the Asiatic problem of Russian and British interests. The work of the translator, J. G. Anderson, has been exceedingly well done. There are reproductions of seventy-five photographs which, with five route-maps, add much to the value and attractiveness of the book.

Notes.

Macmillan & Co. of London announce a new library edition of Walter Pater's works in ten volumes, the first of which will be issued in April.

Deltus M. Edwards has been engaged by Messrs. Henry Holt & Co. to prepare a book which presents the human side of Arctic exploration from the earliest expeditions to the achievements of Peary.

"The History of Kings County, Nova Scotia," by Arthur Wentworth Hamilton Eaton, "giving a sketch of the French and their expulsion, and a history of the New England planters who came in their stead, with many genealogies," is soon to be published by the Salem (Mass.) Press Co.

In addition to the books already mentioned in the *Nation*, the following are some of the spring publications announced by the Macmillan Company: Fiction—"A Brood of the Eagle," by James Lane Allen; "Jim Hands," by Richard Washburn Child; "A Modern Chronicle," by Winston Churchill; "The Undesirable Governess," by F. Marion Crawford; "A Life for a Life," by Robert Herrick; "Lost Face," by Jack London; "Kings in Exile," by Charles G. D. Roberts; "An Interrupted Friendship," by Ethel Lillian Voynich; "Nathan Burke," by Mary S. Watts; "An Unwilling Minerva," by Mrs. Mabel Osgood Wright. Literature and Drama—"The Book of Easter," with an Introduction by Bishop Doane; "The Nigger," a play by Edward Sheldon; "The Rôle of Self in Mental Healing," by Dr. J. W. Courtney; "A History of Classical Philology," by Harry Thurston Peck. Travel and Outdoor Books—"The Picturesque St. Lawrence," by Clifton Johnson; "Practical Farming," by Dr. John McLennan; "How to Keep Bees for Profit," by D. E. Lyon; "How to Keep Hens for Profit," by C. S. Valentine; "Manual of Gardening," by L. H. Bailey. Music and Art—"Groves Dictionary of Music," revised and enlarged under the editorship of J. Fuller Maitland; "Design in Theory and Practice," by Ernest A. Batchelder. History and Biography—"The American Merchant Marine," by John R. Spears; "Daniel Boone and the Wilderness Road," by H. Addington Bruce; "The Last American Frontier," by Frederick L. Paxson; "The History of Mexico," by Justo Sierra and H. N. Branch; "Social and Industrial Conditions in the North during the Civil War," by Prof. E. D. Fite of Yale University; "The Letters of Richard Henry Lee," edited by James Curtis Ballagh, professor of American history in Johns Hopkins University; "The Life of Lord Kelvin" by Sylvanus P. Thompson. Religion and Philosophy—"Building a Working Faith," by Dr. Newell Dwight Hillis; "Studies in Religion and Theology," by A. M. Fairbairn, principal of Mansfield College, Oxford; "The Gospel and the Modern Man," by Shailer Mathews, professor of Historical and Comparative Theology at the University of Chicago: "The Development of Religion," by Prof. Irving King of the University of Iowa; "The Ethics of Jesus," by Henry Churchill King, president of Oberlin College; "Religion in the Making," by Dr. Samuel G. Smith of the University of Minnesota; The Bible for Home and School Series, edited by Shailer Mathews: "The Epistles to the Colossians and to the Ephesians," by Gross Alexander, and "The Gospel According to St. Matthew," by Prof. A. T. Robertson; "The Religion of the Chinese," by Dr. J. J. M. De Groot; "The Religions of Eastern Asia," by Horace G. Underwood; "The Duty of Altruism," by Roy Madding McConnell. Politics and Economics—"Day in Court, or the Subtle Arts of Great Advocates," by Francis Wellman; "Democracy and the Party System," by M. Ostrogorski; "The Old Order Changeth," by William Allen White; "Revolution," by Jack London; "Principles of American Government," by Prof. C. A. Beard; "Great Cities in America: Their Problems and Their Government," by Delos F. Wilcox; "Wage-Earning Women," by Annie Marion MacLean, professor of sociology in Adelphi College. Scientific and Technical—Rural Text-Book Series, edited by Prof. L. H. Bailey of Cornell University, "The Physiology of Plant Production," by J. F. Duggar; Rural Science Series, edited by Professor Bailey, "Fruit-Growing in Arid Regions." Educational—"The Cyclopedia of Education," edited by Paul Monroe, Ph.D., professor of history of education Teachers College, Columbia University; to be completed in five or six volumes; volume I.

D. Appleton & Co. announce the following spring publications: Fiction—"The Green Mouse," by Robert W. Chambers; "White Magic," by David Graham Phillips; "The Depot Master," by Joseph C. Lincoln; "The Gilded Chair," by Melville Davisson Post; "Tony's Wife," by George Gibbs. Juvenile—"On the Trail of Washington," by Frederick Trevor Hill. History and Biography—"A History of the People of the United States" (Vol. VII, bringing the work up to 1852), by John Bach McMaster; "An Admiral's Log," by Rear-Admiral Robley D. Evans, U.S.N. (retired); "The Real Francis Josepb: The Private Life of the Emperor of Austria," by Henri de Weindel (English version by Philip W. Sergeant); "The Last Days of the Emperor," by Paul Frémeaux; "Republican France," by Ernest Alfred Vizetelly; "Queen Christina of Sweden," by I. A. Taylor. Travel and Sport—"The Big Game of Africa," by Richard Tjäder; "Up the Orinoco and Down the Magdalena," by H. J. Mozans; "George Grenfell and the Congo," by Sir Henry Johnston; "Travel and Sport in Turkestan," by Capt. J. N. Price Wood. Science—A new uniform edition of the works of Herbert Spencer, in eighteen volumes; Appleton's Science Primers, edited by J. Reynolds Green: "Astronomy," by F. W. Dyson, professor of astronomy in the University of Edinburgh; "Geology," by J. W. Gregory, professor of geology in the University of Glasgow, and "Physiology," by Professor Sherrington, of the University of Liverpool; "Descriptive Meteorology," by Willis L. Moore, chief of the United States Weather Bureau; "Aerial Navigation," by Alfred F. Zahm, professor of theoretical and applied mechanics, Catholic University of America; "Music: Its Laws and Evolution," by Jules Combarieu, lecturer at the Collège de France (translated by Joseph Skellon); "The Modern Science of Languages" by H. Cantley Wyld, professor of science, Liverpool University (in the International Scientific Series); "A History of Birds" by H. O. Forbes, reader in ethnography, Liverpool University (in the International Scientific Series). Miscellaneous—"The Southern South," by Albert Bushnell Hart, professor of history at Harvard University; "Race Distinctions in American Law" (this title may be changed), by Gilbert T. Stephenson; "The Story of Sugar," by G. T. Surface, instructor in Yale University; "A Manual of Nursing," by Margaret Frances Donahoe, superintendent of nurses and principal of Training School, Philadelphia General Hospital; "Nutrition and Dietetics," by Winfield S. Hall, M.D.; "The Conquest of Disease Through Animal Experimentation," by James P. Warbasse, M.D., chief surgeon of the German Hospital, consulting surgeon to the Sency M. E. Hospital, Brooklyn, N. Y.; "The Psychology of Reasoning," by Prof. W. B. Pillsbury, University of Michigan; "The American Hope," by William Morse Cole, assistant professor of accounting in Harvard University; "The American Public Library," by Arthur E. Bostwick; "The Reconstruction of the English Church," by R. G. Usher, instructor in History, Washington University.

It is announced that *Putnam's Magazine* will suspend publication with the April issue, when it will be combined with the *Atlantic Monthly*. The original magazine of this name was founded in 1853 by George William Curtis, and was suspended in 1857, having numbered among its famous contributors Lowell, Thoreau, Longfellow, Stoddard, and Stedman. As revived in 1906, it represented the absorption of the *Literary World*, the *Reader*, and the *Critic*, the last named founded in 1881 by Miss Jeannette L. Gilder and Joseph B. Gilder, and published at first fortnightly, then weekly, and, finally, as a monthly. Mr. Gilder had been editor of *Putnam's* since its revival, and Miss Gilder had contributed "The Lounger" department of comment and gossip. Miss Gilder and Mr. Gilder will discontinue their connection with the magazine upon its suspension.

Notes on determination of position near the Poles, by Arthur R. Hinks of Cambridge University, and the discussion upon the paper when read before the Royal Geographical Society by some of the most eminent polar explorers and distinguished cartographers, are published in the *Geographical Journal* for March. The difficulties of getting accurate observations, that of the meridian altitude of the sun for instance, are very clearly shown, and the fact is emphasized that "published accounts of the details of polar observations are scanty." A chivalrous people is described by Douglas Carruthers in an account of a recent journey in Northwestern Arabia, a region still almost unknown to the outside world. So little intercourse do the Arab nomads have with other peoples that "camels are their sole means of exchange." The different tribes virtually live by robbing each other, but "in the case of battle near an encampment, it is a recognized thing that neither party enters the camp. The fight is carried on according to certain rules well away from the camp, and does not endanger the lives of the women and children, who are left behind to look after the camels." Killing not being the aim of the fight, it is really very like playing a game, rough, says the well-known traveller, David Hogarth, but "perhaps not even so rough as

football after the American fashion." An interesting discovery was the remains of a large khan far away out in the sterile desert, showing that here was probably the ancient trade route between Egypt and the Persian Gulf.

Benedetto Croce, whose "Æsthetics" in its English dress has attracted unusual attention in England, and has drawn from Mr. A. J. Balfour a striking compliment in his recent Romanes Lecture, has supplemented this work by a volume of "Problemi di Estetica" (Bari: G. Laterza & figli), dealing with various problems connected with the theory and history of æsthetics. Among the fifty or more essays in the book may be mentioned those on Criticism and Literary History, Plagiarism, Comparative Literature, The Theory of Literary Style, Technique and Art, The Definitions of Romanticism, Humor, The Search for Literary Sources, and The Æsthetics of Gravina. Signor Croce has just received the highest honor which can be conferred on an Italian: he has been elected a Senator for life.

To the small well-printed books of the world's classics the Oxford University Press (New York: Henry Frowde) has added "Sylvia's Lovers," by Mrs. Gaskell. In the opinion of some this is her masterpiece, being of larger scope than the more famous "Cranford," and more passionately conceived than "Wives and Daughters." It is the fifth of her books to be taken into this handy edition. Clement K. Shorter provides a brief introduction suggesting the background of actual history in this tale of old Whitby.

After an interval of three years, Miss Jessie L. Weston has published the second part of her study on the "Legend of Sir Perceval," her two volumes constituting, respectively, the seventeenth and the nineteenth numbers of Mr. Nutt's Grimm Library. The first part dealt primarily with the Perceval story as treated by Chrétien de Troyes and his continuator, Wauchier de Denain, but it set forth also the author's general view of the history of the cycle. In the present volume, the starting-point is the prose "Perceval," known commonly as the Didot version from the name of the only manuscript hitherto published. Miss Weston prints from the Modena manuscript of the same document what proves to be a much better text, and subjects it to a careful analysis as regards both form and substance. She makes out a good case for the propositions that the prose "Perceval" is based upon a metrical version, and that this latter was the work of Robert de Borron. The greater part of the volume is taken up with the French text, which runs to more than a hundred pages, and with the discussion of its contents. The later chapters, which are frankly of a more speculative character, undertake to trace the whole history of the Grail tradition, deriving it in the first place from nature cults of the ancient Celts, and explaining many features of its symbolism by parallels from occult mysticism, both pagan and Christian. The development, if of the sort Miss Weston supposes, would be hard to trace (she describes it herself as a current that flowed underground); and the evidence she uses, derived in part from an anonymous informant, who is a "practising mystic," is not easy to control. But while, to the exoteric mind, at least, it is far from sufficient to prove her whole theory, it deserves serious examination.

The Index of Economic Material in Documents of the States of the United States, compiled by Adelaide R. Hasse and published by the Carnegie Institution of Washington, has been advanced a step nearer completion with the issue of the seventh volume dealing with Illinois. In all essential particulars, the material listed is the same as that in previous volumes, consisting of the printed reports of administrative officers, legislative committees, special commissions of the States, and Governors' messages for the period since 1809. The Index also undertakes to supply volume and page references to all material of economic importance which the listed works contain, except only the reports of the bureaus of labor, already indexed in a volume published in 1902, by the late Carroll D. Wright. The material for Illinois offered certain peculiarities requiring slight adaptation of method in this case, but in the main the volume performs for that State what has already been accomplished for the six States previously treated.

In a monograph entitled "The Transition in Illinois from British to American Government" Dr. Robert Livingstone Schuyler has made a scholarly contribution to the history of a portion of the old West. He has given a brief but well-balanced and impartial account of an early phase of westward expansion—the breaking down of the first American frontier, and the overthrow of British control in the region west of the Wabash. Taken in connection with the writings of Professors Turner, Alvord, and Carter, and with the publications of the Illinois State Historical Society, this work points to a more scientific treatment of a phase of American history that has hitherto been dealt with in separate fragments, largely from a local point of view. Except in the articles referred to above, little attempt has been made in the past to study British policy during the period after 1763 in the region ceded by the French in the treaty of Paris, or to connect local administration there with the governmental activities in Whitehall. Even Dr. Schuyler leaves something to be desired in this respect, for he does not appear to have made any appreciable use of other than printed material. Certainly, the history of British Illinois cannot be adequately handled unless one has access to records in Ottawa, Washington, Philadelphia, and London. Carefully as Dr. Schuyler has done his work, his conclusions can hardly be considered definitive. It seems a questionable policy for a student aiming to fulfil the requirements for the doctor's degree to select a subject that he is unable to develop in all its bearings. As a preliminary investigation demonstrating the author's competency to do good historical work, this study is deserving of commendation, but Dr. Schuyler should have been more outspoken in his preface regarding its incompleteness (Columbia University Press).

About the Boston of John Hancock and his Dorothy Q. it would be difficult to write a bad book, so inherently entertaining is the record itself. But Mary Caroline Crawford, in "Old Boston Days and Ways, from the Dawn of the Revolution Until the Town Became a City" (Little, Brown & Co.), has retold this familiar story with spirit and tact, communicating unpretentiously a considerable amount of original and documentary matter. She is a discreet enthusiast for old times, perceiving clearly enough certain human defects both in the Revolutionary populace and in its heroes. There are abundant illustrations of an authoritative sort, none more welcome than those likenesses of grave citizens and fair women which Copley made for so many Boston homes. Miss Crawford has written other books in this vein of genial yet not uncritical antiquarianism, but has never before dealt with so compact and important a theme. She has acquitted herself creditably in the broader as in the narrower task.

The teaching of Jesus, according to the synoptic Gospels, finds sympathetic treatment in "The Ethic of Jesus," by Rev. James Stalker, D.D. (A. C. Armstrong & Son). For thirty years, since his popular "Life of Christ," Dr. Stalker has contributed wisely and constructively to the extension of knowledge concerning the New Testament. He is an evangelical, moderately progressive, possessed of fine balance of judgment, gentle religious spirit, and appreciation of what is most worth teaching. His writings are semi-popular, and the present volume is distinguished by sane portrayal of the evangelical doctrine of duty, virtue, and the highest good. His chapters on sin and repentance are of special excellence, and his analysis of what the Gospels contain and do not contain in the way of social doctrine is particularly timely. His argument that Jesus was a teacher of religion, not a social reformer, is well supported.

"For twenty-five years and more," Dr. C. A. Briggs, as he tells us in the preface to his "Church Unity" (Scribner), "has labored in behalf of" that ideal, and he has gathered together in this volume fifteen studies bearing more or less directly upon the subject, including The Historic Episcopate, The Validity of Orders, Infallibility, The Sacraments, The Theological Crisis, especially in America, The Constitutional Crisis in the Church of England, The Passing and the Coming Christianity. Most of the essays have already appeared in print, and it is to be regretted that the dates and places of publication are not given. The volume, as Dr. Briggs says, "is an earnest effort to solve the hard problems of Church Unity and to reconcile the various parties to the controversies which distract Christendom." His zeal and sincerity of purpose and the learning which he brings to his task are unquestionable, and the value of some of the studies is great. The book will find many sympathetic readers who will gain both instruction and inspiration from it. But that it will materially forward the cause so dear to the author's heart it is difficult to believe. The futility of all efforts for organic church unity becomes more apparent with every passing year. Church unity indeed is not likely ever to be restored so long as it is made an end in itself. Only when some great cause so lays hold upon the conscience and the imagination of all Christendom that Christians everywhere forget the Church in their eagerness to give themselves to the common task, only then will existing differences cease to divide.

A valuable work, the first volume of which has just been published (Berlin: Martin Warneck), is Dr. Conrad Müller's "Bismarck's Mutter und ihre Ahnen." It is well shown that the intellectual qualities and distinctive traits of character, which distinguished the first German imperial chancellor, and contributed to his brilliant success as a statesman, were inherited from his mother, Wilhelmine Menken, and her ancestors, and not from the Bismarck progenitors. The marked influence of the maternal lineage is clearly and conclusively set forth in the record of Bismarck's youth, to which the present volume is confined, and will be still more manifest in the delineation of his later development and political activity.

Jean Maurice Prou, who succeeds Henri Weil as a member of the Académie des Inscriptions, was born at Sens in 1861. He is a librarian in the Cabinet de Médailles of the Bibliothèque Nationale, professor of diplomatics at the Ecole des Chartes and editor of *Le Moyen Age*, and has published "Les Monnaies carolingiennes," and "Recueil des actes de Philippe Ier," and other works on numismatics and history.

David Alexander Munro, assistant editor of the *North American Review*, died on March 9 at the age of sixty-five. He was a native of Maryburgh, Ross-shire, Scotland, graduated at the University of Edinburge, and then came to New York and entered the editorial department of Harper & Bros. From 1887 to 1889 he was the publisher of *Garden and Forest*. In 1889 he became general manager of the *North American Review* and from 1896 until 1899 was the editor. Since then Mr. Munro had been assistant editor under Col. George Harvey. He supervised the collation and transmission of American contributions to the last edition of Liddell and Scott's Greek Lexicon, and collaborated with Dr. Philip Schaff in preparing the "Companion to the Study of the Greek New Testament."

Eben Alexander, professor of ancient languages at the University of Tennessee from 1873 to 1886, of Greek at the University of North Carolina from 1886 to 1893 and since 1897, died at Knoxville last Friday at the age of fifty-nine. He was United States minister to Greece, Rumania, and Servia from 1893 to 1897.

Arthur John Butler, widely known as a Dante scholar, died on February 26, at the age of sixty-five. He was professor of the Italian language and literature in the University College, London, though he had had several other interests, notably a connection with the Cassell's publishing house from 1887 to 1894, when he became assistant commissioner in education; while in recent years he had been employed in the Record Office editing calendars of foreign state papers from 1577 onwards. His principal work was a translation of the "Divina Commedia," with a commentary, and a translation of Scartazzini's "Companion to Dante," while he himself wrote a serviceable book on "Dante: His Times and Work." He had also translated the memoirs of Marbot and Thiébault and the "Correspondence of Cavour," and had charge of the English rendering of Busch's "Memoirs of Bismarck." He was a frequent contributor to the *Athenæum*.

Marie-Henri-Arbois de Jubainville, professor of the Celtic language at the Collège de France since 1882, died recently in Paris, at the age of eighty-three. Some of his earlier historical work won for him membership in the Academy of Inscriptions and Belles Lettres in the place left vacant by the death of François Lenormant. Since 1882 he had been editor of the *Revue Celtique*, and he had also published "Le Droit Celtique," in two volumes, which remains an authority on the custumals of the Bretons; "Les premiers habitants de l' Europe," an example of exact scholarship based on dated text rather than archæological or anthropological research.

Gustave Janicot, who died recently in Paris, had been connected with *La Gazette de France* for more than sixty years. He had written novels, and much dramatic criticism under the pseudonym, Edmond Rack.

Charles Joliet, who had contributed frequently to French periodicals, died recently at the age of seventy-six. His publications include "Les Pseudonymes du jour," "Curiosités des lettres, des sciences, et des arts," and "Romans incohérents"; and he also wrote a successful comedy, "La Bougie rose," which was presented at the Théâtre Français.

A. Caland, tutor of English in the State High School at Wageningen, in the Netherlands, died there recently at the age of fifty-five. He had been a voluntary and valued contributor to the Oxford English Dictionary.

Science.

Botany of To-day. By G. F. Scott Elliot. Philadelphia: J. B. Lippincott Co. $1.50 net.

In these days of extreme specialization, it is increasingly difficult to get a general view of any comprehensive subject. The work of coördination is always embarrassing, because each specialist naturally insists upon the great importance of his own field. The author who sets about the preparation of a popular treatise on any subject, nowadays, must expect harsh criticism from every investigator whose work he may happen to leave out of account, and hence many good coördinators are deterred from undertaking popular exposition.

The present English work on the "Botany of To-day" is reassuring. It shows that the art of popularizing science in the best sense has not been wholly lost. The author presents the chief features of a large district of scientific research in an attractive manner and with very few mistakes of proportion or perspective. Moreover the reader is led along the paths of survey by a guide who walks with an easy swing and with no fear of a mild jest now and then. Thus, in speaking of the Fern alliance, in the Coal periods, one of the most puzzling groups in nature, he says:

> But the real difficulties and dangers of this chapter begin when one tries to give even a sketchy impression of the great and important discoveries which have been made by many English botanists, who have laboriously examined the actual plants which lived in the forest. So far we have been, intentionally, as vague as possible about them.

Again, in regard to a minute phosphorescent alga, pyrocystis, concerning which

> a curious experiment is recorded which may yet have a practical application. One fills an ordinary tumbler one-third full of alcohol (this is more than three fingers or a third mate's peg, as it is sometimes described), and then adds as much seawater with pyrocystis as it will hold. If one then gently shakes or jars the tumbler, the pyrocystis will glow with most unusual brilliancy for a time, not exceeding four minutes; they then sink to the bottom of the tumbler and remain very quiet, indeed, for a very lengthened period!

The author has travelled extensively and has made good use of his advantages. From some of the experiences in mid-Africa a good deal of illustrative material is brought, and this is employed in a telling manner. Any traveller who has had to rough it in the tropics and in deserts, gets a good deal of nonsense knocked out of him and sound sense comes to take its place. As is to be expected, the author treats the subject of bacteria in their relations to health and disease in a very judicious manner, putting the reader fully on guard, but not frightening him too much. Thus, after the account of the bacterial friends and foes, we have the following which is well worth quoting.

> When exploring a well or rubbish-pit, belonging to the Gallo-Roman period, M. Baudouin discovered some suspicious mud. In this, he found several dangerous disease-bacteria, and kindly points out that by living in a half-comatose condition, they were still prepared to start a dangerous epidemic, after 1,800 years in the bottom of a well. Fortunately, eminent bacteriologists hastened to reassure the public mind, by declaring that these bacteria were only our own contemporaries, who had got into the well with the rainwater. So that this awful foreboding of a thousand-year-old bacteria still waiting to prey on us need not alarm the most sensitive person.

The wide range of this admirable book may be seen from the following partial list of chapters: Seaweeds and Leaf-Green; The First Land Plants; Reconquest of the Water; Sense-Life and Sensibility; Seaside and Strand Plants; Ants and Mites; Electricity, Radium, and X-Rays; Arable Land; Fortunate Islands; Plant-Breeding; On Evil in Small Doses.

The chapter on the reconquest of the water reminds one of the best work of that famous popularizer, Grant Allen. After getting the plants fairly established on land, following their early development as aquatics, he seems to think

that turn about is fair play, and he shows, like other œcologists, that these terrestrial plants again invade the water, and become adapted to the changed conditions there, constituting morasses and the like on an enormous scale. Under the heading Sense-Life and Sensibility, the author discusses the general subject of the irritability of protoplasm and its amazing phenomena. The chapter on ants gives us the most interesting facts relative to the interaction between ants and plants, and deals in a delightful manner with the contrivances by which certain plants manage to support a standing army of defenders to ward off the leaf-cutting enemies. He speaks in a feeling way of "ants' inhumanity to ants that makes countless thousands mourn, for it is other insects of their own kind that these fierce body guards are intended to keep away." The fortunate islands are the tropical homes of the myriad forms of vegetation which fill every nook of available space. In this account the author goes with much skill over the phenomena and forms which have fascinated every student of abundant equatorial life. The chapter on Evil in Small Doses is devoted to the important matter of plant diseases. Thus it will be seen that the author has covered many of the more interesting, as well as the more important subjects.

The photographic illustrations do not fit the text very well. The two that show the manufacture of maple sugar in Canada, exhibit amusingly primitive methods. Here and there one may notice a slip in proof reading, for example, where mile is given for millimetre; and occasionally, the construction is somewhat obscure; but these trifles are pardonable in so good a book with so full an index. Finally, the book is up to date. Most of even the recent advances in the different portions of the field of plant activities are given in detail so that a careful perusal of the treatise will place even an unscientific reader in possession of much of the latest information.

The "Vital Economy" of Dr. John H. Clarke (A. Wessels) is the new "American" edition of a little book which attracted some attention a year or so ago. The only change seems to be a brief appendix to meet certain criticisms. The book is intended for readers who have no great store of strength to spare and who should learn not to waste what little they still have. The advice is, however, not without value to the stronger brethren who follow popular idols. Dr. Clarke treats of the tyranny of the tub and the damage done by soap, the possibility of too great zeal for fresh air, the over-estimation of exercise, the harmfulness of stimulants, the wastefulness of worry—all this in a sketchy, somewhat superficial manner, yet with a certain conviction calculated to impress many who need just such advice. Some of the opinions of the author about bodily magnetism and vitality are heterodox, and also quite false, belonging to a time which the modern medical man is glad to think has been left far behind; but these do not seriously mar the presentation of the doctrine which his experience tells him he ought to preach.

Shinrokuro Miyoshi, professor of naval architecture at the Kobu Daigakko, died last January in Tokio, at the age of fifty-three. He drafted the first shipbuilding regulations for Japan, and most of the naval architects of that country received their first instruction from him.

Drama.

Dante and Beatrice. By Sara King Wiley. New York: The Macmillan Co. $1.25 net.

This poetic drama is the last work of the late Mrs. Wiley, and is so full of literary and dramatic promise that the stroke of death seems particularly cruel. On its dramatic side, indeed, the play is weak, so far as its fitness for theatrical representation is concerned; for although it contains some poignant situations, and tells a continuous and perfectly intelligible story to the reader, it often shows a complete disregard for stage necessities. It would have to be recast before it could be successfully acted. But it is a moving bit of romance, in which the spirit of the period is vividly reflected, and historic facts are skilfully used as the foundation of a passionate, eloquent, and dignified story. Evidently Mrs. Wiley had studied her subject reverently. In drawing her Beatrice and her Dante she has produced two figures, which intellectually and spiritually are not unworthy of the great originals. That she has endowed the youthful Dante with the spirit of prophecy and with the attributes of his later years is a liberty easily permissible to poetic license. At all events, she has succeeded in approaching verisimilitude where the veteran and erudite arch-trickster Sardou failed utterly.

The illusion which she creates is literary and psychological, independent of scenic aid. Dante first appears as a young and popular poet refusing to take active part in the fierce faction fights of Guelf and Ghibelline. Then he encounters Beatrice on the bridge, and in the following scene meets her in the house of Simone dei Bardi. She, knowing him her worshipper and venerating his nobility of soul, begs him to show her how she may best fulfil her ambition to save the world; whereupon he, hailing her as "a mirror of celestial light," bursts into a prophetic rhapsody—one of the most stirring passages of the book, glowing with poetic and patriotic spirit—in which he welcomes a prospective life of martyrdom for Florence, if only he may speak and live. Beatrice, in like exalted mood, prays that the souls of the glorious dead may inspire his song. They part as unpledged lovers, but presently Beatrice's father, old Portinari—who mistrusts poets—tells her that she must wed Simone, and she, apparently hoping to avoid that fate, bids Dante seek glory in the field.

It is in the camp that Dante, now renowned as a warrior, hears of Portinari's death and Beatrice's marriage. Maddened, he seeks the latter in her husband's house, and, in a scene of notable eloquence, upbraids her with the seeming treachery that has shattered his faith and sunk him in despair. She reminds him that there had been no proffer of love or exchange of betrothal, and when he, recalling desperately the unspoken bond between them, urges her to flee, rebukes him with a noble austerity and vigor that subdue him utterly. Rallying, he craves pardon for his offence, declaring that henceforth his imperishable love shall have in it no trace of earth. And so they part, Beatrice promising that at the last he shall receive a message from her. In the final scene Dante, in a tumult of rebellion and despair at the news of Beatrice's death, receives from the faithful but reluctant Simone her dying permission to kiss her dead lips, and is comforted. The play closes with an exultant soliloquy in which Dante conjures up the vision of Beatrice in Paradise and proclaims her the guiding star of his future.

This skeleton sketch is given simply as an indication of the nature of what is in many ways a remarkable achievement. Other historical characters and subsidiary episodes are introduced with excellent literary and pictorial effect, but not with much dramatic pertinence or significance, although the characterization is vivid. Dante and Beatrice are all in all, and it is the preeminent merit of this essential but untheatrical drama, that these partly legendary figures have been abstracted, as it were, from the works of the poet himself and made substantial and human without spiritual or intellectual degradation.

The artistic resources of the New Theatre were manifested in a striking way on Monday evening, in the production of Maeterlinck's miracle play, "Sister Beatrice." This, as our readers know, is a work of delicate poetic fancy, and deep devotional feeling, which, in stage representation, would be ruined utterly by ordinary theatrical methods. At the New Theatre every artistic device has been employed, and, on the whole, with marked success, to create an appropriate atmosphere. The musical accompaniments of Max Marshalek are felicitous, and are admirably executed; the convent scene, in its simplicity and noble dimensions, furnishes an impressive background to the action; the costuming is rich and picturesque, and the supernatural incidents are most effectively managed. Moreover, the acting is of that subdued and carefully calculated order which best harmon-

izes with the spirit of a piece which is itself more or less visionary and unreal. The management was peculiarly fortunate in securing the services of so refined, accomplished, and imaginative an actress as Edith Wynne Matthison to play the parts of the errant nun and the Virgin Mary, who concealed the nun's lapse from virtue by assuming her vacant place. She invested the human character with great womanly charm, and the divine one with a wonderfully dignified and gentle benignancy. It was a delight to watch her free, broad gestures—so natural, so graceful, and so significant—and to listen to the mellow tones of her voice. In the closing scene her portrayal of the physical and spiritual sufferings of the dying prodigal was full of eloquence and pathos, while singularly free from theatrical exaggeration. She was very well supported by Pedro de Cordoba, Mrs. Dellenbaugh, Mr. Ben Johnson, and others. By way of contrast to the spirit of celestial love with which the Maeterlinck piece is irradiated, the management presented certain extracts from the Christmas eve scene between Brand and Agnes, in the fourth act of Ibsen's "Brand." As a sample of the whole play it was quite insignificant, and insufficient, while it was equally futile as an exposition of character. Lee Baker could not suggest the iron fanaticism of Brand, nor could Miss Russell fathom the emotional agonies of Agnes. The novelty of the performance did not compensate for its dulness.

Music.

REVIVAL OF WEBER'S "FREISCHUETZ."

Of the operatic revivals of the season the most interesting is that of Weber's "Der Freischütz," which was heard last Friday at the Metropolitan. That it would be welcomed by many seemed probable in advance, because of the popularity of "Hänsel und Gretel," which indicates that thousands of adults in this town have preserved the faculty of enjoying a fairy tale told with modern music. Weber's opera was sung for the first time in 1821, yet in some respects it is as modern as Humperdinck's. If the composer of "Hänsel und Gretel" profited by Wagner's example, Wagner no less profited by Weber's. Had it not been for the Wolf's Glen scene in the "Freischütz," which made Wagner shudder in his boyhood, it is not at all certain that he would have gone so far as he did in the direction of musical realism, which revolutionized operatic methods. While Wagner is celebrated for his boldness, it took even more courage on the part of Weber to write pages which Tieck called "the most unmusical noise that ever raged on a stage," but which, Beethoven exclaimed, were "the right thing. Wherever the devil puts in his paws, we are sure to feel them."

Before this opera was written, it was taken for granted that all music, though the scene be devilish, must be angelic. The grewsome was tabooed till Weber set to music the midnight scene in the Wolf's Glen, with the monstrous owls and other uncanny sights and sounds, and the circle of human skulls in the midst of which Caspar casts the magic bullets. With this scene musical romanticism was born. For the first time, an orchestra was used deliberately to make sounds that were as uncanny as the scene on the stage. For the first time, also, was an orchestra used for the production of tone colors that were aimed at for their own sake as a means of producing emotional effects. This is one of the main elements of musical romanticism, and from this point of view, again, the "Freischütz" marks the beginning of a new epoch.

A great injustice has been done to Weber by the musical historians and critics. Almost unanimously they give Berlioz credit for innovations that sprang from the genius of Weber. It was Weber's scores that suggested to Berlioz his audacious experiments in orchestration. It was Weber who anticipated Wagner in the artistic use of leading motives long before Berlioz did it. Countless writers have said that the *idée fixe* in Berlioz's "Fantastic Symphony" is interesting historically as the first instance in music of what Wagner afterwards termed the "Leitmotiv." As a matter of fact, Berlioz, who was an enthusiastic student of Weber's scores, did not write this symphony till eight years after the production of the "Freischütz," in which there are eleven leading motives recurring in thirty-four places.

The revival of "Der Freischütz" would have served a useful purpose had it been only to provide an opportunity to do justice to Weber. But it was also a treat in itself quite apart from all historic considerations. There is so much simple and heartfelt melody in this opera that Weber was accused of having helped himself to the treasures of German folksongs; but these airs are his own as thoroughly as Grieg's Norwegian songs are his own. Operatic melody is subject to frequent change in style, but Weber's melodies, like Schubert's, are not affected by time, like the fashionable arias of Rossini and Donizetti. Airs like "Leise, leise," "Durch die Wälder," "Wir winden dir den Jungfernkranz," and a dozen others in this opera affect the hearer as do the "quotations" in a Shakespearean play.

London has been indulging in an orgy of excitement over Strauss's "Elektra." The newspaper writers, with flamboyant pens, incited the people till, as one observer remarks, "the public seemingly expected Smithfield to be depleted for an endless succession of sacrificial processions, a whole evening of drums lashed with whips, a pile of corpses on the stage—in fact, something made up in equal proportions of Tophet, the shambles, and Bedlam. It is a sign of the times that such things should be done in London in the American manner. The American tail has wagged the British dog in this case with a vengeance, for New York began it; and the attitude does not become the British dog." But it was not the public alone that lost its balance. One of the critics called the production of the opera an event "second only in importance to the memorable occasion when Wagner's Ring of the Nibelung was given for the first time in England."

The Berlin *Tageblatt* reports that Edyth Walker, who acted Elektra in London, was entertained the other day by Strauss, who played for her the first act and part of the second of his new opera, "Tartuffe." She liked it, and said: "It is entirely different from anything ever before done by him. The music is quite easy. There is even a Vienna waltz in it." This fulfils the prediction that Strauss, having reached the limit of orchestral acrobatics, will next astonish the world by writing as simply as Bellini.

Art.

DRAWINGS BY HENRI MATISSE.

It would be well if the visitor to the Photo-Secession could forget that Matisse is the object of a cult, the reputed possessor of strange secrets and philosophies, the regenerator of the torpid art of the age. It would be well to ignore all this and suppose that these are anonymous sketches which the post has brought to Mr. Stieglitz, and which have so warmed his heart that he has asked his friends in to see them.

Matisse conceives the body as a powerful machine working within certain limits of balance. The minute form of the tackles and levers does not signify for him, what counts is the energy expended and the eloquent pauses which reveal the throb of the mechanism. The important thing is that muscles should draw over their bone pulleys, that the thrust of a foreshortened limb should be keenly felt, that all the gestures should fuse in a dynamic pattern. So much for the vision. It differs in no essential respect from that of great draughtsmen of all ages. A Matisse drawing, looked at without prejudice, is no more bizarre than a study of action by Hokusai or Michelangelo. It belongs in the great tradition of all art that has envisaged the human form in terms of energy and counterpoise. Look at any of these drawings, the walking woman so sensitively balanced, the crouching woman, she who averts some attack, she who stands firmly with her leg doubled back sharply on a chair. In the last drawing note how the bulk, and retreat, of an almost invisible calf of the foreshortened leg are indicated by a single powerful stroke that tells of the tension athwart the knee. Such drawing is odd only because it is so fine that much of it there cannot be. The nearest analogies

to these sketches are those remarkable tempera studies by Tintoretto which have recently been discovered and published in part in the *Burlington Magazine*. In fact, Matisse is akin to all the artists who approach the figure with what Vasari calls *furia*. The Frenchman is a kind of modern Pollaiolo.

His originality lies less in vision than in a strenuous economy of workmanship. He will have the fewest contours and the most expressive, will not shirk any syncopation or exaggeration where he seeks an effect. That his method is really more concise than that of Michelangelo may be doubted. Hokusai's is certainly more direct and simple and equally potent. A calculated roughness, which occasionally disguises itself as the queer linear slackness with which Rodin has familiarized us, brings Matisse's manner very close to that of the aboriginal designers who scratched animal forms on bones in time prehistoric, or only yesterday adorned with admirable animal paintings the caves of the South African veldt. These savage masterpieces show the same keen sense for balance and significant action. Matisse is reputed to have individual and novel theories about counterpoise, correlation of gesture, etc. It may be so, but these drawings merely suggest a fresh attitude toward the model, and a desire for unhackneyed poses. That some doctrine may be involved is suggested in those caricatures in which he bloats and distorts the figure, evolving a grotesquely expressive pattern out of a pose that already grazes the impossible. The ingenuity of such studies will escape any but a trained eye. Perhaps, he is experimenting to ascertain the bounds of the physically possible and pictorially credible. It would be like the eminently intelligent and experimental nature of the man to do so.

There is one question which a plain man might very properly ask, namely: "Is this all there is of it, or is it a preparation for something else?" To us these drawings have a painful, we trust a misleading, air of finality. The few compositions represented in chalks or photography are merely extensions of the single figure or quite commonplace calligraphies. It is possible that Matisse will always be making these magnificent studies. The present exhibition gives small hint of constructive imagination. If so he will merely take his place with other geniuses who have sacrificed themselves in the passionate invention of processes. Pollaiola and Hokusai, to a considerable extent, represent this inability to organize a complicated whole. Meanwhile one is grateful for so much. It is no small gift to have one's vision toned up to this strenuously controlled enthusiasm for the human mechanism. The effect of this work upon modern art can only be beneficial. Matisse as painter is almost unknown to the present writer, who suspects that there individual and arbitrary caprice may be masking as genial invention. As for these drawings, there is no manner of doubt. They are in the high tradition of fine draughtsmanship of the figure. If, on sufficient acquaintance, they still seem merely eccentric to any one, let him rest assured that the lack of centrality is not with them, but with himself.

"The Lives of the British Architects from William of Wykeham to Sir William Chambers," by E. Beresford Chancellor, is a routine bit of bookmaking for which the justification is not quite obvious. Since the biographical material is perfectly accessible a compilation of this sort should offer either felicity in presentation or acuteness in criticism. These qualities are absent in the present case. The author is too frequently on the level indicated by his comment on the apparent lowness of the Radcliffe Library. This, he remarks, "is only an effect, as the building is really of considerable height." The shade of James Gibbs will hardly rejoice in such an apology. Architecturally, buildings are as squat as they seem to be. This book is included in the Duckworth's red-covered series (imported by Scribner), and is well illustrated.

The new wing of the Metropolitan Museum, containing the Hoentschel collection of decorative art, the Bolles collection of American furniture, ceramics, textiles, and the Whistler loan exhibition, was opened last week. This important new feature of the Museum will be reviewed in due course.

The spring exhibition of the National Academy of Design is now open at the Fine Arts building in Fifty-seventh Street. Next week we shall review the pictures at length. The prizes have been awarded as follows: The Clarke prize for figures, Frederick A. Waugh; Inness gold medal for landscape, J. Francis Murphy; first Hallgarten prize, for painting by men under thirty-five years, Gifford Beal; second Hallgarten prize, Louis D. Vaillant; third Hallgarten prize, Charles Rosen; Saltus prize, for the most meritorious picture, Douglas Volk; Julius Shaw memorial prize, Miss Susan Watkins.

Finance.

LIGHT ON A FAMOUS EPISODE.

In the case of sensational and abnormal episodes, whether in politics, in war, or in finance, it will sometimes be many years after the event before its actual causes are understood. The general conditions which made possible the phenomena in question will have been analyzed clearly enough by the critics, but it is not always possible for the shrewdest critics to determine why those conditions operated exactly as they did. Not infrequently, personal considerations and accidental influences settle that part of the question, and in many episodes of the sort, it is only when some active participant tells his story publicly—in interview, testimony, or posthumous memoirs—that the world learns the whole truth.

Otto Kahn's story of the railway struggle of 1901, told at the Government's Union Pacific hearing last week, was a narrative of this sort. Economic criticism long ago made plain what were the general causes underlying the situation of that period—immense expansion in national wealth, drift towards consolidation of great companies, easy credit at the banks, and omnivorous appetite of both the speculative public and the investing public. All this was more or less dimly recognized, even in 1900; but general opinion held that industrial amalgamation was to be, as in 1899, the order of the day. The billion-dollar steel merger was in incubation; other great manufacturing combinations were known to be under discussion, and we had already learned from the events of 1899 that, when movements of this sort were absorbing capital on the grand scale, railway finance had to stand rather quietly in abeyance. Just before the Presidential election of 1900, no less an oracle than James R. Keene gave out the prediction that the stock market would break if McKinley were elected, and would only break more severely in case of Bryan's victory.

What happened, to change the history of 1901 into a continuous campaign in the grand strategy of the railways and a riotous Stock Exchange speculation? Mr. Kahn told the connected story. The episode really hinged on the death of Collis P. Huntington, in August, 1900. Harriman wanted the Central Pacific Railroad, so as to give the Union Pacific a direct east-and-west line from the Missouri River to the Pacific Coast. Huntington's Southern Pacific controlled the Central Pacific through an iron-clad ninety-year lease, dating from 1894. Huntington refused to sell it to Harriman; probably, indeed, even Huntington could not have broken the lease. Mr. Kahn, himself a Union Pacific director at the time, testified that his company distinctly did not wish to buy the whole Southern Pacific system. That system, in his words, "was considered an obstacle and a deterring feature, because we did not care for the Sunset Route."

But Huntington died in August; his estate was known to be in the market with its Southern Pacific holdings; the Gould family and other interests had appeared as possible bidders. Had they bought, the Central Pacific also would have fallen into possibly hostile hands, and Harriman's Union Pacific might have found itself deprived even of the favorable terms regarding San Francisco traffic which it had previously enjoyed. Six months of this uncertainty brought matters to a head, and in February, 1901, $100,000,000 in convertible Union Pacific bonds was authorized to

provide the purchase money. Only $40,000,000 was needed for the Southern Pacific purchase; Harriman fixed the larger amount "because he invariably asked for authority for a larger issue of securities than were immediately needed."

The next incident narrated by Mr. Kahn touched better-known history. Substantial control of the Chicago, Burlington & Quincy, an important connection and competitor of the Union Pacific system, had been offered to Harriman by the Burlington insiders, as far back as the beginning of 1900. The terms were not satisfactory, but negotiations continued throughout the year. Not until late in 1900 did Mr. Hill appear upon the scene; in March, 1901, it was announced that he had bought the road for the Northern Pacific and Great Northern. "Prior to that, the idea of buying Northern Pacific had never been in our minds or been mentioned between us." The Harriman party had had an opportunity before 1900 to buy control of another transcontinental road, the Atchison, and had refused because of unwillingness to undertake the reorganization. In 1901, the Rock Island was offered to Harriman by the inside interests, and he wished to buy it; but his bankers overruled him, on the ground that the work of administration would be too great for him. But it was Mr. Schiff, Kahn's senior partner, who notified his junior, at the end of February, 1901, that, "having exhausted all efforts . . . to be allotted a share in that [Burlington] purchase, . . . there was nothing to do but to bring about by indirection that which we had failed to bring about directly," and that this "could only be brought about by our purchasing a control of the Northern Pacific."

What followed, everybody knows—competing bids, by the "Morgan interest" and by the "Harriman interest," for the outstanding Northern Pacific shares, possession of which was needed to control; the wildest "bull market" in our history; the most remarkable corner ever known in a railway stock; a Stock Exchange panic day comparable only to Black Friday, and a year or more in which promoters and speculators were cruising about to buy up other railways on a margin and threaten rival interests until the ransom price was paid. The sequence of events is clear enough. But Mr. Kahn's review of the episode suggests one question of high historical interest. Did our great capitalists, as the world at large supposes, lay their plans carefully, long before, for their spectacular achievements of 1901, or was the whole chapter of events a series of impulsive adventures, on the inspiration of the moment?

Mr. Kahn's narrative certainly points towards the second conclusion. The suddenness with which these various enterprises were conceived no doubt explains why Mr. Keene and others, a month or two earlier, misread the future of 1901. Perhaps, also, the ease with which these Napoleonic projects, undertaken on the impulse of the day and in instantaneous response to a change in circumstances, managed to command the money market's support, explains why things were done which no banker in his senses would have dreamed of attempting, half a dozen years before. It is, in fact, not even true that a critical emergency forced these successive ventures; the Burlington itself, over which the great battle

How We Select Our 6% Reclamation Bonds

Our experience with Reclamation bonds covers 16 years. During that time we have bought and sold 78 separate issues of Drainage and Irrigation bonds. All have been secured by first liens on good farm land, and no investor has lost a dollar through default in interest or principal.

We are the largest purchasers of Reclamation bonds, and thousands of bond buyers place confidence in our selections. As a result we are constantly offered the pick of many projects. Thus we are able to select for our customers the cream of these securities.

Our Competent Staff

We employ in our investigations engineers and attorneys of national repute, and of wide experience in reclamation projects. Certified copies of their reports and opinions are supplied to our customers.

The Vice-President of our Company almost constantly travels in sections where land is reclaimed. Thus we keep in close touch with the best undertakings.

We buy no issue of Reclamation bonds until all officers of our Company, and all engineers and attorneys employed in the matter, unanimously agree on the safety of the bonds in question.

The Exact Data

In irrigation projects water supply is now determined by Government records covering a number of years. Government surveys show the area drained by the streams in question. Government records tell the minimum rainfall.

When fertility is in question, soils are easily analyzed. We may know their constituents, and the size and kind of crops they will raise.

Naturally, men don't reclaim land that isn't remarkably fertile. These lands on the average are the most productive farm lands in America. And the question of crop failure is practically eliminated by the control of water supply.

There are few undertakings where the security of a lien can be more exactly determined than in reclamation projects rightly investigated. The Government itself is spending many millions of dollars on such projects, depending solely on the land for repayment.

Farm Lien Security

Reclamation bonds are secured by first liens on good farm land. In irrigation projects the liens are given by land owners in payment for water rights. The bonded indebtedness rarely exceeds one-fourth the land's value. As the liens are paid off in annual instalments the security increases each year.

The bonds are additionally secured by a first mortgage on all the property in which the proceeds of the bonds are invested. Thus we combine corporate responsibility and management with farm lien security.

Some Reclamation bonds are issued by organized districts, so the bonds become tax liens. Some are "Carey Act" bonds, where the State supervises the project.

All are serial bonds, so the indebtedness is rapidly reduced. One may get these bonds maturing all the way from one to twenty years. The denominations are $100, $500, and $1,000. The interest rate is six per cent.

These bonds have become the most popular bonds that we handle. In our estimation it is hard to conceive of any more inviting security.

Ask for Information

Reclamation bonds combine safety with fair interest rate. They appeal to all investors, small and large. Please ask us to send you a new book of facts which we now have in preparation. Cut out this coupon lest you forget.

was fought in the stock markets of 1901, remains to-day in exactly the hands that controlled it when Mr. Schiff sent his ultimatum, and no disaster to any one seems to have followed. Possibly, also, the readiness of banks and investors, in 1901, to facilitate these immensely expensive contests, also explains why most of the chief participants in the exploits of 1901 came to lose their own poise and judgment utterly, not so very long afterward, and to trust implicitly in the safety and certainty of carrying out all their other sudden inspirations.

THE BAKER & TAYLOR CO.
33 East 17th Street, New York.

A History of Mediaeval Political Theory in the West
By R. W. CARLYLE, C.I.E., and A. J. CARLYLE, M.A.
To be in 3 volumes. 8vo. Each, $3.50 net.
Ready; **Vol. II. The Political Theory of the Roman Lawyers and Canonists in the Middle Ages up to 1250.**
Previously Issued; **Vol. I. A History of Political Theory from the Roman Lawyers of the Second Century to the Political Writers of the Ninth.**
The subject which is dealt with is strictly a history of theory, not of institutions. In the Middle Ages, as at other times, the two things are closely related to each other.
The work commences with the second century and comes down to the work of the political theorists of the sixteenth and early seventeenth centuries—that is, to the time when the specific characteristics of modern political theory began to take shape.

A Story of the Siege of Leyden

By Augusta Huiell Seaman

With an introduction by William Elliot Griffis, D.D., and decorative drawings by George Wharton Edwards. (*12mo. Cloth. $1.25 net.*)

STURGIS & WALTON COMPANY, 31-33 East 27th Street, New York

Letters and Memorials OF
Wendell Phillips Garrison

Editor of The Nation 1865–1906

In one volume, crown 8vo, 300 pages, with photogravure portrait

During the forty-one years in which he edited the *Nation*, with a thoroughness, ability, and conscientious devotion unsurpassed in the records of American journalism, Mr. Garrison was an indefatigable correspondent, never employing an amanuensis, but writing tens of thousands of letters with his own hand to his contributors, who embraced practically all the leading American scholars and critics of the period. From a dozen groups of these, which have been kindly loaned by the recipients, a sufficient number of selections has been made to illustrate the relations between Mr. Garrison and his great corps of contributors, the frankness and tact which he exercised towards them, and the wide range of his interests, tastes, and sympathies. The volume also contains a brief sketch of his life, a dozen of his best poems, and several of his characteristic editorials, reviews, and essays, besides a fine photogravure portrait. It likewise preserves the notable letter of appreciation addressed to Mr. Garrison by more than two hundred contributors to the *Nation* on the completion of his fortieth year of service, and his acknowledgment thereof.

TRADITIONS AND CONVENTIONS
DRAMATIC CHARACTERIZATION
THE LOGIC OF CONSTRUCTION
THE ANALYSIS OF A PLAY
THE ELIZABETHAN DRAMATISTS
THE POETIC DRAMA AND THE DRAMATIC POEM
THE THREE UNITIES

DR. WOODS HUTCHINSON'S

THE CONQUEST OF CONSUMPTION

A helpful and practical book for all who are interested in stamping out the Great White Plague. Certain of the chapter-titles are significant, as for instance: Fresh Air and How to Get It; Food: the Greatest Foe of Consumption; Sunlight: The Real Golden Touch; Work and Rest: Intelligent Idleness, etc. Illustrated. $1.00 *net*. Postpaid $1.10.

MARY C. E. WEMYSS'S

THE PROFESSIONAL AUNT

"A charming, witty, tender little book, with much keen observation of children."—*Kate Douglas Wiggin.*

$1.00 *net*. Postpaid $1.10.

WILLIAM J. TUCKER'S

PERSONAL POWER

Direct and earnest counsels to college men by one of the foremost American educators, the former President of Dartmouth College. $1.50 *net*. Postpaid $1.65.

CHARLES STELZLE'S

THE CHURCH AND LABOR

PROFESSOR FRANCIS G. PEABODY of Harvard University says: "I have found it a wholesome arraignment of class-consciousness within the Christian Church, and at the same time a sympathetic appreciation of the church as a social factor."

ROBERT A. WOODS, South End House, Boston, says: "It signalizes one of the most vital rapprochements in the moral life of to-day, and it is an important and enduring document in the present-day stage of American history."

50 cents *net*. Postpaid 55 cents.

PAUL AND PAULINISM

By JAMES MOFFATT

Dr. Moffatt writes out of a prolonged study of the subject, so that the volume may claim to have behind it that original research without which no contribution to the literature of Paulinism is entitled to a hearing.

50 cents *net*. Postpaid 55 cents.

EVERY-DAY BUSINESS FOR WOMEN

By MARY ARONETTA WILBUR

Simple and accurate instructions for the conduct of the usual every-day affairs which will prove useful not only to women who work for their living, but to the thousands (both married and single) who wish to exercise their independence in these matters. $1.25 *net*. Postpaid $1.34.

THE EARLIEST SOURCES FOR THE LIFE OF JESUS

By F. C. BURKITT

Professor Burkitt has made a special study of the Semitic Christianity that once flourished east of the Roman Empire, and believes that the rise of the Christian Church can be understood only in relation to the hopes and fears of the Jewish nation during the first century.

50 cents *net*. Postpaid 55 cents.

POEMS OF BELIEF

By THEODORE C. WILLIAMS

The poems express devoutly and freely the common experiences of the religious life, but are not ecclesiastical. The accent is rather upon truth than feeling. The standpoint is ethical idealism. With frontispiece by Elihu Vedder. $1.00 *net*. Postage extra.

Spring Bulletin FREE on Request.

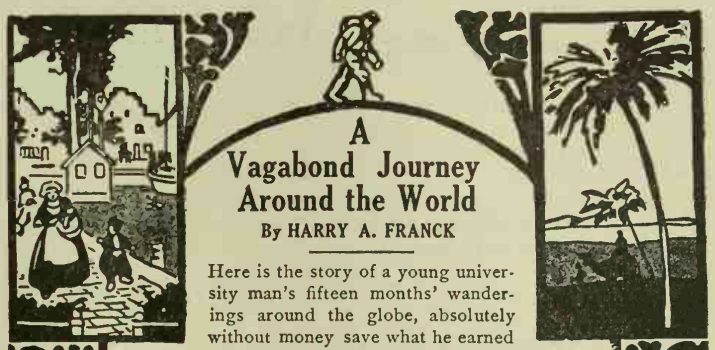
The Greatest Travel Book of the Decade



A Vagabond Journey Around the World
By HARRY A. FRANCK

Here is the story of a young university man's fifteen months' wanderings around the globe, absolutely without money save what he earned by the way. He had keen powers of observation; he was intensely interested in every man, woman, and child he met, however wretched and low-caste; he had the Yankee trait of making himself easily at home in any and all circumstances. French tramps, underground denizens of German cities, Arabs of the desert, high- and low-caste people of India,—these, and countless others, are shown as real personalities and they stand out with the vividness of Kipling characters.

The Most Vivid Picture of Native Life in Strange Corners of the World that Has Ever Been Presented

Every Page Glows with Life. It is Illustrated with 100 Pictures. 500 pages. $3.50 net; postage, 23 cents.

The Century Co., New York

A WONDERFUL NEW SMALL DICTIONARY.—Thin Bible paper, 1,224 pages, only 1⅜ in. thick, 7¾x5⅛; 50,000 words defined; Webster's, genuine morocco, value $4.50; delivered, with Success Magazine one year, $2.45. No other way to get it at this price. Send order now or ask for circular. E. M. DUNBAR, 53 C State St., Boston.

School Advertising in the Nation

THE NATION stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions.

SPECIAL RATE

TEN CENTS A LINE NET FOR THIRTEEN TIMES (minimum space three lines)

Orders may be forwarded through any responsible advertising agency, or directly to

THE NATION, 20 Vesey Street, N. Y.

Timely New Macmillan Books

NEW BOOKS FOR EASTER GIFTS

Bishop W. C. Doane's — The Book of Easter

A collection of varied bits of literature grouped so as to express the thoughts of the season, rising from old hopeless views of death in ancient times through the world-wide joy in the return of new life in spring to the glorious hope of immortal life taught by the resurrection of our Lord. *Introductory Essay by Rt. Rev. William Croswell Doane. Decorative drawings by George Wharton Edwards. 12 full-page halftones from famous paintings.* *Decorated cover, $1.25 net; postpaid, $1.35.*

Dr. Henry van Dyke's — The Spirit of America

"His broad, generous, sympathetic presentation of some of the more striking features of the American Spirit is both instructive and highly entertaining," says one critic; another, in the *Chicago Tribune,* recommends the book strongly to young Americans for the inspiration of its spirit, saying that taking it up "is like stepping into another and a better world." *Cloth, 12mo, $1.50 net; postpaid, $1.62*

BOOKS FOR THE LOVER OF OUT-DOOR WORK

Manual of Gardening

By L. H. BAILEY.

A new practical guide to the making of home grounds and the growing of flowers, fruits, and vegetables for home use. *Cloth, 12mo, profusely illustrated, $2.00 net; postpaid $2.14*

How to Keep Hens for Profit

By C. S. VALENTINE, a well-known authority. *Ready in April*

How to Keep Bees for Profit

By DR. D. E. LYON, the bee expert and enthusiast. *Ready in April*

Practical Farming

By DR. JOHN McLENNAN. *Ready shortly*

The farmer will no longer drift on in old ways. The man with even the smallest "back-yard" is waking up to its possible relation to "the cost of living." And these books aim to put at their service the wisdom of men who make a business of securing the highest results with the least effort and expense.

A Book of Vegetables and Garden Herbs

By ALLEN FRENCH.

A practical handbook and planting table for the house garden. *Cloth, illus., $1.75 net; postpaid $1.90*

A Self-Supporting Home
The Earth's Bounty

Two sensible practical books by KATE V. ST. MAUR, being simple detailed accounts of the work of a home place month by month. *Each, cloth, illus., $1.75 net; postpaid $1.88*

A Woman's Hardy Garden

By HELENA R. ELY. *Cloth, $1.75 net; postpaid $1.87*

The Garden of a Commuter's Wife

By "BARBARA" (MABEL OSGOOD WRIGHT). *Cloth, illustrated, $1.50*

Always popular and useful books among garden lovers.

THE NEW MACMILLAN FICTION

Mrs. Voynich's *new novel*
An Interrupted Friendship

Mrs. Voynich's work has that wonderful quality in great fiction of making imaginary characters live with an insistent vitality, so that they haunt the memory as do only a few remarkable human beings. Her "Gadfly," who reappears in this volume, is a case in point. *Cloth, 12mo, $1.50*

Mrs. Atherton's *new novel*
Tower of Ivory

By the author of "The Conqueror."

"Ordham and Margarethe Styr are persons conceived and presented with extraordinary clearness and power. One does not doubt that the bond which unites them . . . is the supreme bond which has linked the great lovers of all time."—*The Nation.* *Cloth, 12mo, $1.50*

Mr. Winston Churchill's *new novel* — *Ready next Wednesday, March 30*

A MODERN CHRONICLE

By the Author of

"Richard Carvel," "The Crisis," "Coniston,"
"Mr. Crewe's Career," etc., etc.

Cloth, $1.50

Published by THE MACMILLAN COMPANY 64-66 Fifth Ave. N. Y.

The Nation.

NEW YORK, THURSDAY, MARCH 24, 1910.

The Week.

Apart from all questions of Cannon or "Cannonism," the insurrection in the House of Representatives gives evidence of the general state of political feeling, and, above all, of feeling on the tariff. Honest men like President Taft and Representative McCall may succeed in convincing themselves that Aldrich and Cannon gave the country a "square deal" on the tariff, but it is plain that they will never convince anybody else. To satisfy the demand of the country, to fulfil the expectations that had been aroused in the campaign, a change in the tariff was necessary whose reality it required no fine statistical argument to establish. If the indignation against the tariff taxes levied on the people by favored interests, which had been steadily rising year after year, was to be stilled, the change in the tariff had to be one that was clearly visible to the naked eye. The reception that Mr. Taft's Winona speech met with was a foretaste of what happened in the House last week. When powers that are almost despotic in themselves, and whose range is coextensive with the government of a great country, are exercised not only with gross disregard of the rights of minorities, but also in the interest of a system of tax-spoliation of which the country is thoroughly tired, such a storm as we are witnessing is a natural result.

On a careful reading, Secretary Ballinger's address before the Minnesota State Conservation Convention reveals important shortcomings. Mr. Ballinger was more fortunate in those passages in which he endorsed the work and aims of the originators of the conservation movement than in those other passages in which he either displayed resentment toward individuals or entered upon the interpretation of statistics. When he said that "our country is the richest of all in natural resources," that wise conservation implies "as full and free a development of our natural resources as is consistent with our civilization and needs," and that "what the public needs to-day is a speedy survey of all available areas for settlement and an adequate classification of the remainder of the public lands" as a preliminary to legislation, he was originating no new doctrine, for those are statements which the leaders of the conservation movement have been making in a hundred forms ever since they took the lead. On the other hand, when Mr. Ballinger referred to "doctrinaires" and their "wholly exaggerated notions" he was unconvincing, while his use of statistics in dealing with the duration of the coal supply invites close scrutiny.

Mr. Ballinger finds that the apparent supply of coal still available is 99.6 per cent. of the original supply, "or coal enough to last, as some claim, for a period of 7,000 years." While it is true, as the National Conservation Commission pointed out in its report, that prophecy as to the duration of the coal supply must possess questionable value, because it is impossible to foresee the future rate of consumption or of waste, it is equally true that any attempted estimate ought to be soundly reasoned. Messrs. Marius R. Campbell and Edward W. Parker of the United States Geological Survey, the experts who reported on this subject to the National Conservation Commission, were selected on account of their competence in the field. They discovered a prospect grotesquely at variance with that which Mr. Ballinger apparently accepts as not unreasonable. They showed, by one method, that, provided waste is unchecked and the present increase in the rate of consumption continues, "the 1,382,780,000,000 tons available at the close of 1907 would be exhausted in one hundred and seven years"; and by another method, allowing for a constantly diminishing rate of increase in consumption, it would be exhausted in one hundred and twenty years. These estimates may be mistaken; but the 7,000 years of future supply, which "some claim," and Mr. Ballinger seems to find satisfactory, depends on the assumption that the present rate of production will remain stationary, and that all waste will be eliminated. Since for the five decades just past consumption has increased at a rate of 73.6 per cent. per decade, while but little more than half of the available coal is recovered by present mining methods, such an assumption is clearly inadmissible.

Readers of the newspaper reports of the oral arguments in the Standard Oil appeal case, before the United States Supreme Court, will possibly have gained a puzzled impression that the counsel were dealing in glittering generalities rather than grappling with the hard legal facts of the controversy. Such feeling of perplexity may have been deepened by the interpellations from the bench. Thus Justice Harlan's interruption of Mr. Milburn's plea for the company with the query, "Would you call an organization of men to buy all the coal lands in Pennsylvania a conspiracy in restraint of trade?" and Mr. Milburn's cautious answer that "the question you put is one difficult of solution," might to some minds seem to be of deep significance. So, too, of Mr. Milburn's apologetic remark that he was out of his line in discussing monopolies, and Justice White's retort, "I think you are in your line," and of Justice McKenna's sharp demand of Mr. Watson if he thought the Circuit Court's decree was the only question before the Supreme Court, and Mr. Watson's hasty abnegation of such a theory. Perhaps some people may have been tempted to read between the lines of these colloquies an indication of prejudice by the court. The fact of the matter is, however, that, as one of the company's counsel put it, the Supreme Court is a law unto itself, and in nothing more so than in this cross-questioning of counsel. The law and fact, as interpreted by counsel for the Government and for the company, are set forth in voluminous briefs, usually containing hundreds of pages of argument, citation, and precedent. These briefs do not often come before the general public's eye, but it is they which chiefly determine the ultimate finding of the court.

The American Prohibition Year-Book for 1910 asserts that "the figures of the United States Census show almost inexhaustible data for prohibition argument." The pro-liquor advocate might come back with the statement that in

the American Prohibition Year-Book one might pick up a wealth of data in favor of a liberal excise policy. Without subscribing to the latter view, one may nevertheless draw, from the figures cited in the prohibition manual, the fact that there has been less change in the drinking habit than in the drinking habits of the American people during the last forty years. In 1840 the annual per capita consumption of distilled liquors was 2.52 gallons. After thirty years' fluctuation the figures stood at 2.07 gallons in 1870, whence, during the next decade, there was a drop to 1.27 gallons, around which figure the annual consumption has remained; in 1909 it was 1.37 gallons. The consumption of malt liquors in 1840 was 1.36 gallons per head; in 1880 it had risen to 8.26 gallons; in 1909 it was 19.7 gallons. To the Prohibitionist, whose principles do not discriminate between distilled and malt liquors, this should be a discouraging development. The rabid anti-prohibitionist will seize upon such figures as proof of the utter failure of prohibition. But the great fact that must be taken into account, of course, is the change in the character of our population since 1840. The advent of the malt-drinking German immigrant has profoundly affected the drinking habits of our entire population. It supplied an impetus which has not exhausted itself twenty-five years after the slackening of the tide of German immigration.

Pittsburgh is presenting the spectacle of a miniature Reign of Terror. The terrified, however, are not fleeing the wrath of an inflamed populace; they are members of the Select and Common Councils hurrying and scurrying to cover by confessing that they have been taking bribes. The element of the comic is injected into this sordid semi-tragedy by the eagerness of the rush, and the fear which oppresses some of these representatives of the people that the policeman may seize them before they can get their confession in. One of these worthies rushed into court late in the afternoon anxious to confess. "Come back to-morrow, we're too busy," said the judge. Was ever anything like this seen since the days when the guillotine was kept so busy in Paris in '93? The guillotine, however, in the case of these precious rogues, will mean, it seems, only official decapitation; while those who are too stiff-necked to confess are to be energetically prosecuted and severely punished.

Monday's $50,000,000 New York city bond sale was eminently successful, in the sense that it showed readiness of investment capital to subscribe in abundance for such issues. The loan appears to have been almost four times over-applied for; thus contrasting in a gratifying way with the $29,000,000 city bond offer of 1907, of which only $2,000,000 was taken, and even with the $40,000,000 offer of last June, which elicited $68,000,000 total applications. The result of Monday's offer disposed at all events of the notion, which had found more or less expression, that the city's credit was impaired. It is true, on the other hand, that the price obtained was relatively low—or, to put the matter in another way, the city has had to allow a higher interest rate than heretofore. The actual price, secured on the average from bidders to whom the bonds were awarded, is higher than in two preceding city bond sales; but those bonds bore an interest rate of only 4 per cent., as against 4¼ in the present instance, and the net yield to the investor, estimated on the interest rate and the average premium bid, is larger than in any New York bond sale of recent years, except for that of September, 1907, and that of February, 1908—just before and just after the panic. This circumstance, however, cannot rightly be construed as reflecting unfavorably on the city's credit, for the course of events has been precisely similar in the market for other equally high-grade public loans.

How precious a possession the New York City Hall is few people realize. Many architects regard it as the most beautiful building in America. Built just before the artistic chaos of the last century supervened, it is the most conspicuous and palpable link between ourselves and that European civilization from which we sprang. It is one of the last structures anywhere that carry the stamp of historic tradition and are dignified by consistent and appropriate style. Without this City Hall our American art would be deprived of an indispensable monument—would be in the case of American literature were the works of Washington Irving obliterated. Of course, nobody proposes to destroy the City Hall. Even those who have only a vague sense of its importance instinctively love it. They know that it is venerable, and that the eyes rest willingly upon it. The mere suggestion of its destruction would raise an outcry, from the newsboys who ply their trade about it to the dwellers in our remotest borough. But something only a little less disastrous than its destruction is proposed, and New York generally is indifferent. This can only be through failure to grasp the seriousness of the emergency. When it is realized that to rebuild the court-house on its present site is to destroy the effect of the City Hall, there will be widespread protest against so needless a vandalism. Facing the need of a new court-house, the city government has heedlessly considered the erection of a high building across the north end of the park and immediately behind the City Hall. Any structure of this sort would not merely encroach upon precious park space, but would dwarf the City Hall and make it apparently no more than a stepping-block to the court-house. The mere consideration of such a project must show its impropriety and lead to its rejection.

Contrary to what one would imagine at first sight, "Ozanna Roosevelti" is not the Sudanese formula of adoration with which Fuzzy-Wuzzy's kinsmen are acclaiming the head of the returning Smithsonian African expedition. Yet with that expedition the picturesque bit of nomenclature is intimately bound up. For Ozanna Roosevelti, as described by Edmund Heller in Vol. 54, Part 6, of the "Smithsonian Miscellaneous Collections," is nothing less than "a Sable Antelope collected by Kermit Roosevelt in the Shimba Hills, British East Africa, representing a form easily distinguishable from *Ozanna Niger*." Here, then, is a foretaste of the treasures that are now floating northward on the bosom of the Nile. The talent for zoölogical classification so strongly manifested in the discoverer of the Malefactor, the Mollycoddle, and the Muckraker, has proved hereditary, and Kermit has a new animal species to his credit at the very beginning of his career. For purposes of closer scientific identification we quote the official measurements of Ozanna R.:

Skull: Condylobasal length, 415; basilar

length, 365; zygomatic width, 150; interorbital constriction, 108; nasal, 144; maxillary toothrow, 109 mm.

No doubt, this might be put into shorter and uglier terms, but the reader can find these for himself.

Mr. Fairbanks's message of peace from around the world has authority and timeliness. As against the passionate newspaper correspondent at Tokio, Washington, or Berlin, Mr. Fairbanks has had the advantages of an equable temperament and plenty of time for observation. When he says that "we were never further removed from the possibilities of conflict that we are to-day," he is stating a fact which the present condition of international politics the world over emphatically reinforces. Whatever may be the cause, the fact is there. So far as Europe is concerned, Dr. Dillon, in the *Contemporay Review*, sums up the situation in a single sentence: "The governments in quest of money are pacific." Dr. Dillon's views are not encouraging as to the distant future, but for the moment they reassure. "The Powers are busy replenishing their depleted coffers under conditions of steadily-growing difficulty, and, like the wild animals at feeding-time, they hate to be disturbed." Among the governments now in the money market are Germany, Prussia, France, Turkey, Greece, Rumania, Hungary, Bulgaria, Servia. Itself in a pacific mood, Europe refuses to take seriously the wild rumors on which we, in this country, are fed concerning our relations with Japan. The European nations have lived too closely together for too long a time not to be impressed by the efficacy of 10,000 miles of ocean as a preventive of war.

The two attempts to deal with the problem of the Lords show a strong contrast. Mr. Asquith has brought forward his resolutions, which are of the expected tenor. The first resolution provides for complete control of money bills by the House of Commons, thus unmistakably disposing of the question that was precipitated by the Lords' rejection of the budget; the second precludes the Lords from rejecting any bill that has been passed by the Commons at three successive sessions, provided the entire time the bill has been before the House is not less than two years; and in the same case the bill becomes a law without the royal assent. This proposal is in diametrical contrast with the first of Lord Rosebery's resolutions, declaring that "a strong and efficient second chamber is not merely an integral part of the British Constitution, but is necessary to the well-being of the state and the balance of Parliament." A second chamber that was perfectly helpless in the face of any majority in the House of Commons which could be counted on to hold out for two years could certainly not be described as a "strong" body.

The House of Lords, in committee of the whole, has adopted not only this resolution of Rosebery's, but also the other two resolutions proposed by him. The second, declaring in general terms the necessity of "reforming and reconstituting" that House, was adopted without a division; the third, which declares that "possession of a peerage should no longer of itself give the right to sit and vote in the House of Lords," was adopted, after a short debate, with a near approach to unanimity, the vote being 175 to 17. Between the two parties, there will certainly be a clear contest of the most profound and important kind on the issue of a strong second chamber; and the most acute question just now is, how much popular support the Conservatives will gain for their side by the adoption of the radical reform to which the Rosebery resolutions commit them. In a word, these resolutions call for more power and less privilege; for more strength, based on more ability to use that strength rightly. As between this and Mr. Asquith's proposition to leave the House of Lords what it is in composition, while depriving it of nearly all real significance in action, there will be plenty of room for doubt as to the nation's decision. Seldom has a people been called upon to decide, in a single election, a more interesting or a more vital Constitutional question.

The Prussian Government has forced through the House of Delegates the so-called franchise reform bill, against which the bulk of the Prussian people has been protesting. It is not necessary to sympathize with the violence of the language of the Socialist Representative, Liebknecht, which drove out of the building most of the Clericals and Conservatives, to feel that he is correct in his contention that this outcome of the suffrage fight settles nothing. The franchise battle there is bound to go on, with the Socialists in the happy position of fighting the battle of all the people, and not merely of those who favor its policies. In a recent issue of *Ulk* there is a picture of Christ with an inscription that he never received the degree of doctor of philosophy, nor graduated from a public school—he was nothing but a sort of a "low-down, third-class elector." This illustrates something of the spirit in which the battle is being waged—it is becoming a kind of holy war. The Government, having sowed the wind, may now reap the whirlwind. When a ruler forces his programme after such overwhelming demonstrations of popular distrust, he ought to be prepared for the worst. When it comes time to write the obituary of King William of Prussia, it can never be set down that he was either truly enlightened or in the least degree in sympathy with the aspirations of the bulk of his people.

In Italy the Sonnino Cabinet has gone out of office after holding power for a little more than three months. The resulting situation is undoubtedly puzzling, but scarcely of great significance. There is no far-reaching issue of immediate moment upon which the Italian Parliament is divided. The question is one of personalities. The Chamber of Deputies is divided into four or five groups, none of which is strong enough to assume office and no two or three of which can be held together by any other leader than the late Premier, Giolitti, who made way for Baron Sonnino last December. Giolitti abandoned office virtually of his own free will. He had been long at the head of the Government, and it suited his purposes to remain in the background for a while. Baron Sonnino has had the support of Giolitti's followers at the latter's express directions. It was a situation which the Chamber and the press accepted as a good deal in the nature of a farce. Giolitti seems to have been willing to keep up the game for some time, but Premier Sonnino, one of the most respected personages in Italian public life, evidently grew weary of the job of seat-warmer for his astute predecessor.

THE SPEAKERSHIP STRUGGLE.

Throughout the great fight on Speaker Cannon there has been involved a mixture of two issues, on their face quite distinct. The question of the power that ought to be conferred on the Speaker in the control of legislative business is one thing, the question whether that power has been abused by Mr. Cannon is another. But easy as it is to distinguish between these questions in the abstract, it was inevitable that they should be inextricably bound together in the actual contest and trial of strength. And alongside this double character of the fight, we must place the party issues which were interwoven with it. The regular Republicans, standing by Cannon from start to finish, were involved in no perplexity; but the insurgents and the Democrats could never lose sight of the fact that they were dealing with three distinct and yet interwoven elements—the curbing of Speakership power, the repudiation of Cannon personally, and the helping or hurting of party prospects in the Congressional elections of next autumn.

Had the effort to choke off Mr. Burleson's motion for the deposition of Speaker Cannon succeeded, had the House adjourned last Saturday immediately after passing the Norris resolution, there would have been a breathing-spell during which the country, and the House itself, would have digested the result as bearing on the first aspect of the question. That resolution goes far to break down the power of the Speaker; it does break down completely that part of it which gives him despotic control, the selection and domination of the Committee on Rules. With this accomplished, and with no immediately subsequent test of the attitude of the insurgents toward Speaker Cannon personally, attention would have been centred almost exclusively on the question of what the victors would substitute for the system they had overthrown. But the test that Mr. Burleson insisted on forcing, and which Mr. Cannon more than welcomed, brought the other aspect of the issue to the front; the Republicans plucked from their defeat unexpected comfort in the shape of a larger majority for the Speaker's retention than he had commanded when elected to the Speakership of the present Congress. The result on Saturday night accordingly assumed, on the surface, the form of a crushing defeat for the system of Speakership domination that Cannon represented and a personal victory for Cannon himself.

But it is on the surface only that the outcome of the great fight bore this character. When the tumult has subsided, and the new Committee on Rules has begun to grapple with the extraordinary difficulties of the situation, it will be seen that some form of concentration of power to control business is necessary, and it will not be surprising if we shall witness a reaction on the abstract question of Speakership power; but it is almost unthinkable that such a reaction should take the shape of a reconciliation with "Cannonism." Whatever may be necessary for the successful conduct of Congressional business, to admit the necessity of such absolute power—over great things and small, over party questions and questions of non-partisan character—as has been exercised by Mr. Cannon is to throw overboard completely the idea of the House as a legislative body. It is possible that sober second thought will come to the support of the idea of Speakership power that was repudiated in the Norris resolution; it will not come to the support of that idea as embodied in Speaker Cannon.

That the uprising was wholesome in its nature and that it will be beneficent in its results we have no doubt whatsoever. In the practical conduct of public affairs a nation is constantly confronted with situations in which theoretical objections of great moment can be urged against a proposed course of action, and in which, nevertheless, that action is manifestly demanded by existing conditions. Even if it could be demonstrated with scientific precision that absolute power in the hands of the Speaker is the only possible means of assuring the working of such an institution as the House of Representatives, a revolt such as this we have been witnessing would still be justified. It is one thing to say that you must have a despotism, and quite another thing to say that the despotism shall be exercised to the limit of its theoretical possibilities. A despotism that is unendurable will not be endured—this axiom is simpler, and rests on more secure ground, than does the accredited theory of Speakership power, however scientific its basis. The terrors of House anarchy are terrors of the future; if they come about, we may rest assured that they will not be allowed to persist very long. The abuses of Speakership despotism, on the other hand, are solid facts of the past, and especially of the immediate past, and a virile people will not be deterred from grappling with them by the difficulty of providing anything to take their place. They will proceed in the only way in which they can proceed in such a situation; they will begin by overthrowing that which they have found to be a tyrannical abuse. Whatever may be the future development of the struggle, it will be a long time before the country will be asked to submit to the kind of domination that has been embodied in the Cannon Speakership.

THE ETHICS OF PRICE-MAKING.

A select committee of the United States Senate, with Mr. Lodge for chairman, has been engaged on the problem of the high cost of living—or, as it should rather be entitled, the high prices of the necessaries of life. That the committee is getting a number of more or less interesting, important, and trustworthy bits of information is hardly to be denied. But that any really valuable result can come from an inquiry conducted in the manner of this, is in the highest degree improbable. We say nothing as to the rectitude of the committee's purpose; though it were granted that Senator Lodge and his associates had no more interest in the standing of the tariff than in the character of Henry VIII, it would still be idle to expect from these "hearings" a conclusion of authoritative character or of substantial value. In the first place, the facts to be inquired into are of such a nature that only through the patient labor of trained investigators of economic and statistical questions can they be satisfactorily determined or intelligently classified. And secondly, after the facts are ascertained they can be made fruitful for the practical purposes either of daily life or of statesmanship only through the interpretation of the facts in the light of broad economic principles. Indeed, it may justly be asserted that any one who has not formed the instinctive habit of associating economic facts with economic principles will not know how to look for the facts themselves; for the circumstances that on the surface appear to cover the point at issue are often

by no means the significant facts of the case.

Throughout the discussion of the price question, in Congress, in the committee, in the newspapers, there is a constant tendency to talk about who is "to blame" for the high prices. A number of interesting exhibits have been presented to show that extortionate retail profits are to blame; and yet five retail meat dealers who were before the Senate committee some days ago declared that the retailer is being crushed to the wall. "I blame the farmer," said one of them. "So does the packer. The farmer explains he has to raise so much good corn in order to feed his cattle. Possibly he lays too much stress on this argument. At any rate, I think the farmer is responsible for driving up prices in the last five years and is now reaping the big profits." Thereupon Senator Crawford of South Dakota, whose constituents are almost all farmers, came to the defence of the agriculturists, and did his best to clear them of the scandalous charge that they had been getting a high price for their product when they could find people willing to pay it. The retailer, on his part, refused to admit that his class were getting anything out of the rise; they got only the same number of cents per pound above the wholesale price as they did in former times, and not the same percentage; and sometimes they couldn't get that, because when they attempt to raise prices above a certain point, "the public won't stand for it." This looks like a good translation into current American slang of the musty old "classical" law of supply and demand; and the evidence it furnishes of the continued existence of that law is the more valuable because this Washington meat-dealer, like Molière's hero, was talking political economy without knowing it.

Now, in this matter of placing the "blame," it is high time we were all getting our bearings with regard to the fundamental point at issue. Time was when "every schoolboy," or at least every grown man with an elementary knowledge of economics, was supposed to understand that the prices of commodities and services were, in the absence of special conditions that interfered with competition, governed by supply and demand. Under this view of the economic organization of society, a farmer was not to be "blamed" for getting a dollar for a bushel of wheat or twenty dollars for a hog; if the price was highly remunerative, he was simply to be congratulated on his good fortune; and if the price was higher than the natural possibilities of supply warranted, it was to be expected that the temptation to increase the supply would be sufficient to provide the remedy. If the price was permanently maintained, that was proof that it was the price which existing conditions warranted, and there was nothing more to be said. There is no law of God or man that prescribes that the owner of a forty-acre farm shall be limited to an income of $1,000; if he can sell his produce at such prices as to make $2,000 or $3,000, he has earned it just as the hod-carrier has earned his $600, or the carpenter his $1,200, or the lawyer his $10,000, or the banker his $50,000. And the same thing applies to retail trade. If there is no combination, or understanding, among retailers that prevents competition, the fact that certain rates of profit prevail year after year must be taken as presumptive evidence that they are the rates which are called for by the adjustment of supply to demand—the supply of the conveniences of the retail stores and the demand for those conveniences. In a word, what a man can get for his wares or his services, in the open market, without fraud and without conspiracy, is the measure of what he is entitled to in our economic system.

Of course, nothing of all this applies to the case of either natural or artificial monopolies. And even in other cases, we are not arguing in favor of putting a gag on inquiry. The inquiry is well worth making, but it must be made with a full appreciation of the elementary factors in the case. In the matter of retail business, for example, it is quite possible that there exist in the trade certain understandings, tacit or express, that have the effect of keeping the rate of profit unnecessarily high. Although we know that the little retail shopkeepers are not amassing fortunes, it is possible that the level of profits is such as to keep a great many more in existence than there is any genuine demand for. Possible, we say; but a person inquiring into the matter in a scientific spirit would ask, first of all, what prevents anybody who chooses from breaking down this scale of retail profits? To judge from some of the statements made by investigating Senators, profits on clothing, on glassware, and what not, are so enormous that if prices were cut in two there would still be a large margin for the retailer; and any respectable merchant who sold goods at half price would, of course, get them sold with tremendous rapidity. And then another point would necessarily come next into the inquirer's mind. Co-operative retail shops are an old idea, both in this country and in England. In England they have attained considerable dimensions; in this country they do not seem to flourish at all; but in neither country do they offer such tremendous economies as ought to follow from the abolition of the retailer's profits if these are as "extortionate" as is sometimes alleged. Why have coöperative shops not driven the ordinary retail shops out of existence in England? Why are they almost unknown in this country? Any properly conducted inquiry into the price question would raise these questions and a hundred others. It would not be content with a scrap-book of miscellaneous answers to haphazard questions. It would seek such light as might furnish guidance to the people in their every-day life, and to the law-makers in determining whether or not there was occasion to take any action in the premises.

PENNSYLVANIA'S CONSTABULARY.

The Philadelphia street-railway strike ought not to slip from the public mind without the calling of attention again to one highly important phase of the battle between order and disorder in the city's streets. We refer to the invaluable services of the Pennsylvania State Constabulary. After the expected failure of the city's police to control the lawless, and the pitiful incapacity of a battalion of the militia to patrol one street, the Constabulary were sent for, precisely as they have been in every important strike since their organization in 1906. The arrival of only 180 of the Constabulary changed the entire situation; thereafter disorder virtually came to an end. What several thousand police had failed to accomplish they did in a twinkling, and in a way to compel the enthusiastic admiration of all beholders. And there is a reason for the difference. The Constabulary is a business organization. Although employed by the State, it knows no politics in its

make-up or in the execution of its orders. It is an object-lesson to the entire country, because it proves that there is no reason why we should have as a nation the worst police in the world, and because it suggests one reason why Europe, with its constabularies, is so much more law-abiding than the United States.

When the bill creating this force was passed at Harrisburg, in 1905, we commented upon its purport as one of the most important developments in American government of recent years. Everything we hoped of it has been realized, and more besides. Originally planned, partly at the behest of labor unions, to take the place of the Coal and Iron Police, which was paid by corporations for keeping order in the mining regions, and to prevent the use of Pinkerton detectives, as in the great strike of 1902, the force, it was supposed, would be little needed outside of the mine districts. As a matter of fact, their services are in demand in every portion of the State. In 1908 they spent in varying numbers six weeks in the town of Chester preserving order in the trolley strike, the local police being powerless and the town in the hands of the strikers. Three weeks ago they were preserving order in Bethlehem. What they accomplished in the Pressed Steel Car Company's strike at McKee's Rocks, near Pittsburgh, last year, is a matter of record. It ought not to be forgotten that while on duty there the Constabulary lost two killed and four wounded; yet when the stress was over strikers and State police fraternized. The former knew the Constabulary had but done their duty, and respected them for it. All in all, this force has answered twenty-eight calls for riot duty since it began work on March 1, 1906.

Altogether the Constabulary has lost seven men killed and eighteen severely wounded since its organization. It numbers only 228 men; yet in the year 1908 alone its members made no less than 5,028 arrests. They have acted as forest, fish, and game wardens; extinguished forest fires; raided "speak-easies," disorderly resorts, and gambling houses; pursued and caught criminals after long day and night marches; captured railway thieves; gathered in numerous "Black Hand" miscreants, and furnished to county law officials precisely the law-enforcing body they have so long needed. In 1909 the members of the Constabulary travelled 500,000 miles, and in the four years of their existence they have patrolled 1,321,509 miles of road. There are only ten officers, including the able superintendent, Capt. John C. Groome; there are no supernumerary staff officers, and only two officers to each troop or company. All promotions are made from the ranks, and since the organization no outsider has been appointed either a non-commissioned or commissioned officer. All offenders are tried by a summary court, and any one found guilty is fined or dismissed. Intoxication is paid for by a fine once only; the second offence means dishonorable discharge.

The few general rules to which this force has lived up are given as follows:

> A man can be a gentleman as well as a policeman; he must treat everybody with respect; if he starts after a criminal he *must* get him; he must never fire save in self-defence, or to secure a prisoner; must never hit a prisoner after arrest, and each constable must always be equal to 100 foreigners.

"The morale and discipline of the force are excellent and, I consider, unequalled by any body of men in the United States," is the opinion of its commander, and we believe it to be a correct statement of the case. Nobody can overestimate the service this body of men has done to the State. The year before its organization, seven of the game wardens had been shot and four killed; the next year not one was injured. The game commissioners testified officially that this change was solely due to "the unhesitating, determined, and persistent pursuit of wrong-doers of all classes by members of that force [the Constabulary]." It is the cheapest investment the State has ever made, and its record answers every excuse, wherever made, that other States cannot do likewise, because of lack of funds. If the situation is studied, it will soon be found that no State can afford to do without a similar body. The sheriff, as a means of enforcing law in rural districts, is a hopeless failure. To him we owe, in part, our record as the most lawless people, with pretensions to civilization, on the globe.

We have dwelt at length on this Pennsylvania success, because we have long felt the need, particularly in the South, of precisely such organizations. In Jamaica, the indispensable character of a mounted negro constabulary has long been established. We are glad to see so enlightened a Southern newspaper as the Charlotte *Observer* coming out in favor of some colored police for that city, to control the lawless blacks. If this is proper for a city, it is for a State as well. Nothing could so rapidly free us from the ignoble disgrace of the lyncher; before efficient constabularies the worst phases of the race trouble in the South would fade away, and the saving of human beings in the way of crime-prevention and the decrease of the chain-gang would be inestimable. But it is not the South alone that needs mounted State constabularies. New York and every other State should have them.

THE STORY AND THE MORAL.

It has always seemed to us that of all objectionable kinds of literature, the most objectionable is the kind which purports to deal with that ancient topic, the Wages of Sin. The fault is in the obvious insincerity of the author's motives. Pretending to be entirely interested in the Wages, he almost invariably concentrates his attention on the Sin. There are very few plays and novels like Ibsen's "Ghosts," which leaves one in a condition of horrified disgust with the consequences of transgression. The plays and novels are innumerable which, for all their unhappy endings, leave behind them a very insinuating picture of the attractiveness of vice. Sometimes the impression is plain that the author has tacked on his unhappy ending as a mere matter of expediency. Having this pleasantly unconventional tale to tell, he is quite aware that in Anglo-Saxon countries his story must plead a moral purpose as its excuse. Wherefore the heroine shoots herself just before the final curtain. "Why, yes, of course," you almost hear the author say towards the end of the fourth act, "I almost forgot that the wages of sin is death; here goes."

In such plays and stories, it is to be noticed that sin is nearly always synonymous with sex. What we had to be thankful for, until very recently, was that the literature of transgression dealing in subjects other than sex did not find it necessary to assume the mark of virtue in order to carry the tale. Mr. Hornung's Raffles, for instance, has not reformed or been killed, up to last ac-

counts. Mr. Arthur Stringer's fascinating wire-tappers and bank-burglars attract solely because their illicit adventures interest us. Arsène Lupin has his spasms of beneficence, as all well-regulated rascals in fiction should have; but Lupin is still unconverted and undefeated. These men have the sincerity of the heroes of the old picaresque novels. If they make evil-living attractive, there is no attempt to palliate the fact. If they make roguery unattractive, it is because their adventures speak for themselves, and carry no pious lesson at the end. For the only way to show that vice leads to pain and death is to show it. The old theologians did it by giving a paragraph or two to the sin and devoting all their fervid rhetoric to the torments of hell. They kept the right proportions.

Of late, however, the novel of roguery, as it is written in this country, has begun to hide itself under a moral mask. The latest wire-tapper ends his life in jail. The get-rich-quick financier "goes broke" on the last page. Even the title of the book is made to suggest a high moral purpose. But between the title and the last page we find the old delight in criminality for its own sake, and the general effect is the old impression of insincerity, of obvious pretence. In the newest story of this kind, our hero makes his entrance in the rôle of a Chicago telegraph operator working honestly but discontentedly for a salary of eighty dollars a month. He decides that he can do better. In company with an equally honest and discontented woman stenographer, he carries out a scheme for beating the bucket-shops by manipulating the "ticker" quotations from the New York Stock Exchange. By the exercise of commendable patience and ingenuity they build up a capital of a few thousand dollars. They go into the bucket-shop business on their own account. They amass a fortune and marry. The man acquires a varied assortment of vices that go with "easy" money, divorces his wife, marries again, builds himself a palace, fights for a place in society, and, in the end, goes utterly to smash. Moral: Don't tap wires and organize bucket-shops; because, even if you accumulate millions, you are bound to lose them, sooner or later, and go back to working for twenty dollars a week.

That, at least, is the moral our writer would have us accept. The true moral of the story is that this broad land of ours is full of "suckers" and "good things" waiting for the right man to come along and make use of them. It is a book which will set many an overworked and under-paid telegraph-operator to brooding over the possibilities of his trade. We could scarcely blame Mr. G. Lowes Dickinson or some other philosophic observer from abroad, if he were to cite this book as illustrative of the essential immorality of the American people. We are restive under the misdeeds of high-finance and at heart admire the methods of the get-rich-quick millionaire. Else, Mr. Dickinson might ask, why are such books written? There is no attempt here at psychological or social analysis; the moral is an obvious pretence; the methods by which the obscure telegraph-operator makes his fortune are not even ingenious or amusing. Evidently there must be an audience in this country that licks its chops over the mere thought of somebody selling somebody else a gold brick.

If such an audience there were, the fact would be regrettable; but it would be something at least to have the appeal made in a straightforward manner. And, to tell the truth, the appeal is made openly enough, if it were not for the smugly virtuous title and the conclusion:

> It was brutally hot in the street. The glare from the stone flagging hurt their eyes. Crowds of people toiled wearily along, jostling them. Behind was the stifling operating-room, with its hard, idiotic clatter, whither he would go as soon as he had a bite to eat, and work a commercial wire for three hours to eke out the eighty dollars a month that he got for working the stock wire. Oh, undoubtedly, this was what he wanted! They stopped on the hot, dirty cobblestones of the crossing to let a big, bottle-green automobile glide by. A man and a woman lolled negligently on the back seat. He didn't want anything like that himself! Oh, no!

This is a very comprehensible feeling. Why drag in the wages-of-sin doctrine at all?

FASHIONS AND ENLIGHTENMENT.

We are now at the opening of the joyful season when Nature and women's hats simultaneously break into a rich and bourgeoning existence. Nature, this coming spring, will probably wear the same style of verdure and sunlight she has hitherto affected. But for Easter millinery we are promised a delightful innovation in the form of those Chantecler hats in preparation for which the greatest dramatic poet of our times did not think it excessive to spend ten years of continuous labor and study. The stern moralist who never fails to lift his voice of protest on such occasions will, of course, raise his wonted plaint. He will point out how incorrigibly ridiculous is fashion when, in pursuit of "the up-to-date," she hesitates at nothing in the entire scale of organic or inorganic evolution that can be stuck upon the head or sewn upon a gown or carried in the hand. Our moralist may even lose his temper and assert that it is an insult to the French poet, to the drama as a whole, and to the dignity of the human mind, that M. Rostand's magnificently symbolic rooster should be degraded to the uses of the modiste. He might maintain that women, by ancient prescription, have a right to make themselves ridiculous; but that they have no right to render civilization ridiculous. He would not, of course, go so far as to refuse to accompany his wife to church in her new hat on Easter Sunday.

Such a moralist is constitutionally unable to see that, for all its absurdities and incongruities, fashion is, at bottom, a force for civilization and morality. It works in ways of its own. Its services are sometimes pitifully disproportionate to its efforts. But in this respect it is perhaps not very unlike such pretentious agents as revolutions, or political conventions, or wars, or treaties of peace, or earthquakes and inundations. As a mere educational force, women's styles are not to be despised. Chantecler millinery will at least make the name of a great dramatic poem familiar to millions of women who otherwise would never have heard of it, or, having heard it, would have immediately forgotten. It is probable that the shop-girl who buys her Easter hat will fail to associate it with M. Rostand and the Molière tradition. But then again she may. There are chances that the good-natured criticisms of various "gentlemen-friends" may lead to a dim searching, now and then, for the facts behind that impaled barnyard fowl. How many innocent purchasers of Trilby hats and Trilby shoes fifteen years ago were led in turn to read the book itself, and, perhaps, another of Du Maurier's books after that, and—who knows?—perhaps a good many other

good novels after that? Literature, like every other phase of life, is not exempt from the philosopher's dictum that it pays to advertise. What would not any publicity agent pay to have every woman in the land carry his advertising bulletins on her head?

The influence of styles upon the hygiene of the body has also been sadly misunderstood. On this point, it is the traditional thing to expatiate on the evil results of constricting the human form into lines that Nature neither parallels nor approves. The stock comparison is drawn between modern woman in her artificial dress and the natural woman as typified in the Venus of Milo. This overlooks the simple fact that the modern woman, like the modern man, is physically the superior of her progenitor of a thousand, or two thousand, or three thousand years ago. Where physical degeneration exists we are inclined to believe that child labor in the factories, for instance, is probably more responsible than tight-lacing. But whatever may be the merits of this or that specific practice, it is only proper to admit that beneath the seemingly arbitrary fashion which decrees that this year everybody must be slim and next year everybody must be robust, there lurks a fine sense of justice, of democratic equality, and of that law of balance that rules the universe. Let us conceive that either the slender figure or the full figure were adopted as a permanent standard of fashion. Immediately one-half the world would be condemned to a position of permanent inferiority. We should have a fixed class of the beautiful and a fixed class of the ugly. It would be the caste system in a most undesirable form. By contrast, there is infinite justice in the law that once in so often the stout shall make themselves slender and once in so often the slender shall make themselves stout. It is a law which distributes the pains and the pleasures with more than human impartiality.

In a dozen ways it is possible to show how fashion acts as an educational and ethical force. The satirist is fond of railing at the fashionable women who play at charity. Yet it cannot be denied that if it were not fashionable to be interested in slumming, or to patronize nurseries and dispensaries in the tenement district, a large amount of good work would be lost. There are times when, as we learn from the "society" columns, it even becomes fashionable for mothers to be very fond of their children and to give them a good deal of attention. In Rousseau's day ladies of fashion brought their babies to the theatre and indulged in public demonstration of maternal affection. That, too, was a fashion to be grateful for. It probably did not hurt the child, and it surely did the mother a great deal of good.

AUSTRALASIAN LITERATURE.

SYDNEY, February 15.

"Living very close to Nature, the Maori was an acute observer of the ways of the wilds; he caught strange whisperings of unknown things, and his mind was saturated with the magic and mystery of the bush." There are novelties of many kinds in the outwardly and inwardly attractive volume on "The Maoris of New Zealand," by James Cowan (Christchurch, N. Z.: Whitcombe & Tombs)—stories and songs without end, recasts of historical narratives that had been unquestioningly accepted, rehandlings of old traditions and legends, fresh evidences of the track followed in the great migrations across the Pacific, new lights on Hauhauism, that Mormonlike breakaway from the religion of the hated colonists—but hardly anything will please the reader better than the many specimens of "the wisdom of the wilderness," culled in all quarters and garlanded here. The Maori was a nature-worshipper who, with a great wealth of imagination, personified all natural objects—the trees and the streams, rain and dew, mist and sunshine. He was familiar from of old with the stars, his forest-lore was as deep as his star-lore, and from the "soul-mastering" forest come delightful folk-tales, fairy yarns, and nature-myths that will be new to all readers. Sitting by the camp-fires on summer nights by the lake shore, in the homes and settlements of the more advanced tribes, or in the huts of the wild Urewcras, the sympathetic author gathered these songs and stories from the *kaumatuas*, the learned old men.

Not the Maori as he was is here described—that has been done to repletion; but the Maori as he is. Yet it is often the "survival of ancient faiths and ancient ways" that is painted. Here lies the distinctive originality of this interesting volume. Such survivals are disentangled. They are traceable in new folk-tales, examples of nature-lore and forest-craft, imprecations, invocations, and incantations. Some years ago Japanese scholars inquired about Maori poetry. There was then, and there is still, no adequate collection of it, but many finds occur in the present volume, and some of them are very beautiful. Dirges, songs of love and regret, canoe-songs, sentinel songs—all are here; the Maori instinctively poured himself into song.

The book has historical value. It gives a new account of the tragedy that darkened the early days of the colony—the massacre at Wairau—and first voices the Maori view of it. No more memorable siege than that of Orakau glorifies the Maori defence in the last heroic struggle for the possession of the land in 1864. Much about it, as hitherto narrated, appears to be mythical. The famous chief, Rewi Maniapoto, in Sir George Grey's mansion at Kawau, implicitly accepted, in the hearing of the present writer, the heroic part assigned to him by history and poetry. As he was absolutely honest as well as very brave, it is hard to believe that he deliberately imposed on Grey and his guest, as on his fellow-Maoris there—the Maori king and other chiefs. Yet the author asserts that the ascription was a myth. A new account from Maori lips is now given, very different from the accepted version, but, though stripping Rewi of his borrowed plumes, leaving his immortal three hundred on a level with their brothers at Thermopylæ.

New Zealand has witnessed two unique and memorable funerals—that of Dictator Seddon in 1906 and that of the Maori king twelve years before. At the exequies of Tawhiao all of old Maoridom was brought to life again; extinct customs were revived; the orations over the grave were rich in song and proverb, symbol and imagery; and the soul of the Maori was laid bare. Hardly in the history of a savage race has a function so impressive been witnessed; never before has it been so adequately described. We now learn that the interment was a blind. Like John Calvin, and for a similar reason, Tawhiao was buried in an unknown grave. We cannot too strongly commend a volume where so much that is new is combined with so much that is attractive. More than sixty highly finished engravings and a map of Maoriland enhance the value of the book.

It was a happy thought, which could have occurred only, perhaps, to an English lawyer, to describe the progress of international law by means of an analysis of leading cases that have been judicially determined and of the judgments given from the bench. Dr. Pitt Cobbett has for twenty years been dean of the faculty of law in the University of Sydney, and he has formed a large portion of the bar of New South Wales. We well understand the sources of his influence from the volume before us ("Leading Cases in International Law"; London: Stevens & Haynes). Purporting to be only a third edition of a work that has long enjoyed authority in England, it is really a new book. It has

been completely recast, the more important parts rewritten and many new sections added. This course was rendered necessary by the momentous developments in international law that have taken place within the last ten years. With the possible exception of the work by Th. Baty, which has been announced, but has not yet reached Australia, the volume here named is the only English treatise that brings the subject down to the present time. The fifty or sixty cases examined are dissected with remarkable keenness, their results are stated with masterly precision, and their contributions to the advance of international law are in each instance summed up in one or more rules or principles that are logically deduced and lucidly formulated.

A large portion of the volume is for the jurist alone, and of this about one-fourth specially concerns the American jurist. But, outside of the more technical parts, there are instructive and interesting excursuses, where the lay student may follow from point to point the growth of the international organism. The author shows how it acquires quasi-legislative and quasi-judicial organs, and how there arises a new habit of international coöperation (pp. 10, 30). He discusses profitably the future of arbitration (pp. 40-41), and he makes the bold suggestion that, in certain cases, the leading states might withdraw from diplomatic intercourse with an offending state. Precisely this step was taken, we may add, when Great Britain refused to recognize the accession of King Peter to the throne of Servia as long as he retained in office his regicide ministers. Again, he builds up a whole section of international law when he defines "international persons" and describes their variety, writes of the "commencement of statehood," and tells of states that lie "outside the family of nations" (pp. 46-48). Apropos of an American case in the English Court of Chancery he discusses the whole doctrine of succession in international law (pp. 71-76), everywhere seizing and enforcing the principles that govern such cases. The immense variety of relations between a suzerain and a subject power is clearly stated.

How thoroughly up-to-date the work is will appear from the exhaustive excursus appended to the discussion of a case bearing on state boundaries. The new conception of vertical as well as lateral boundaries, involving the making of air territorial up to a certain height, is introduced (p. 106). When the author examines the Newfoundland Fisheries Arbitration, he educes five "important principles" disclosed by the progress of the controversy. The right of national expatriation, explicitly asserted by an act of Congress in 1860, leads the author to draw five "conclusions" that will deserve the scrutiny of publicists as well as jurists. Indeed, this volume on peace, with its successor on war, should form an indispensable handbook to all writers on international questions.

A substantial quarto volume of poetry ("Satyrs and Sunlight," by Hugh McCrae), so pretentious that it is issued solely to 130 subscribers, with Lord Dudley, the Governor-General of the Commonwealth, at their head—a book gorgeously decorated and dazzlingly illustrated by the most ambitious of Australian illustrators, should have something brilliant or something solid within it, if it is to satisfy the rather extravagant claims it outwardly makes. What shall we say of its contents? "Exotic" is the verdict the critic at once passes on this collection of poems. The characteristic Australian notes are absent; affinities with English poets, so visible in Gordon and Kendall, are untraceable; there is no manifest literary paternity or demonstrable affiliation. Mr. McCrae's verses strike the reader as being absolutely original—in theme, in treatment, in form, in color, and in music. The subjects of the poems are unhackneyed and sometimes lofty; the imagery is splendid or daring; and there is extraordinary power of visualization. Single lines show a poet's faculty of phrasing, and now and then a quatrain has the lilt of song. At other times missing or defective rhymes detract from our enjoyment of the author's finest verses. "Poems of the fancy," they might have been classified by Wordsworth, who would have denied that, with their lack of soberness, if not of sanity, they are poems of the constructive imagination. They nevertheless challenge attention and would possibly reward a close examination.

T. G. Tucker is professor of classics in the University of Melbourne. A Cambridge scholar of repute, he is devoted to the minute scholarship that has been typical of Cambridge since the days of Richard Bentley, and he is an acknowledged master in the art of amending ancient texts. In this department he has been more successful than Bentley, and his new readings in the text of Æschylus have been accepted by so celebrated a Grecian as Prof. Lewis Campbell. We could spare him from such high tasks a while, if he would only employ his hours of recreation in a manner that would be as easy to himself and more useful to us. But where is the utility of publishing a number of lectures and essays ("Things Worth Thinking About"; Melbourne: T. C. Lothian) such as dozens of men could write as well? These essays on The Teachings of History, The Teachings of Travel, Literary Judgment, and the like are excellent, but they are not the kind of work the lay reader expects from his scholastic teachers. Why is it that, among American and English scholars, there is such a dearth of those who are willing to instruct us in the popular aspects of Greek and Roman life and literature? France abounds in them: J. J. Ampère in a past generation, Gaston Boissier more recently, Paul Masqueray and Maurice Croiset at this hour (to mention only these) have made ancient Rome, Roman public life, the ideas of Euripides, and Greek comedy themes of living interest to all intelligent readers. No one could do work of this kind better than Professor Tucker. As these essays show, he is a master of the art of luminous presentment. Could he not reconstruct for us some neglected phase of the domestic life of old Athens or Miletus, or narrate to us the politics of the Aventine, like a recent French essayist, founding on the work of a recent archæologist?

J. C.

NEWS FOR BIBLIOPHILES.

Twenty-five years ago Charles Plumptre Johnson, in his "Bibliography of Thackeray," pointed out that there existed two different forms of title-page of "The Four Georges," 1861. That of the earlier form, of which Johnson had seen a single copy only, reads, "The Four Georges: | Sketches of Manners, Morals, Court, | and Town Life. | By | W. M. Thackeray," etc. In the later issue the second and third lines were cut out. Shepherd and Melville give only the second form, "The Four Georges. By W. M. Thackeray." Anderson gives the correct form, but adds: "The title-page of the British Museum copy reads 'The Four Georges' only."

In the expectation of bringing to light some such variations in text as he recently discovered in the "Lectures on the English Humourists," the Bibliophile has compared the two books, reading the entire text of the four essays, word for word. No other typographical variations have been discovered, and it may be safely stated that the two issues are identical, and printed from the same setting of types, or more probably from the same stereotype plates. Nor was the altered title of the second issue a substituted one pasted on the stub of the earlier leaf, as is the case of some other books. The title and half-title (which together make the first signature) are the same sheet and continuous. The two lines, "Sketches of Manners, Morals, Court, | and Town Life," appear on the half-title of both issues. There is another point of difference between the two books which seems not to have been pointed out before. The Catalogue bound in at the end of the first issue is dated "November, 1861," and the notice of "The Four Georges," on page 2, is without price. The Catalogue in the second issue is dated December, 1861, and "With Illustrations" and "Price 5s. cloth" have been added to the notice of the book. The sub-title is given in both cases. The book was, apparently, published late in 1861. "The Four Georges," which had been delivered as lectures, first in America in 1855, and in England the next year, were first printed in the *Cornhill Magazine* in the later months of 1860. The American edition, published by Harper & Bros., is dated 1860. This, printed, it may be

supposed, from the *Magazine*, is probably the actual first edition. It also has the subtitle, "Sketches of Manners," etc. One misprint in the English edition, "twenty-five sale of the line" (p. 217), is correctly printed "sail of the line" in the New York edition.

The magnificent private library of the late Amor L. Hollingsworth of Milton, Mass., will be sold by C. F. Libbie & Co. in Boston on April 12, 13, and 14, two sessions each day. The catalogue, a thick volume of nearly 400 pages, describing 1891 lots, contains thirty-six reproductions of title-pages and thirty half-tone plates of bindings. The collection of Americana is perhaps the best offered at auction since the Deane sale; indeed, several items are from that collection, and others are from well-known libraries which have been dispersed during the last thirty years in Libbie's rooms. Among the rarer items relating to New England, we may note Smith's "General Historie of Virginia, New England and the Summer Isles" (1624), the Deane copy; "Plain Dealing: or Newes from New England" (1642), by Thomas Lechford, the first lawyer in Boston; Johnson's "History of New England" (1654), better known by its running title, "Wonder-Working Providence of Sions Saviour, in New England"; Josselyn's "Account of Two Voyages to New England" (1674); Penhallow's "History of the Wars of New England" (1726); Mason's "Brief History of the Pequot War" (1736), the Balcom copy, which brought $445 in 1901; and Backus's "History of New England, with particular reference to the Denomination of Christians called Baptists," 4 vols. (1777-1784). Other important items of Americana are: Lescarbot's "Histoire de la Nouvelle France" (1609); Romans's "Natural History of East and West Florida" (1775); Haywood's "Civil and Political History of Tennessee" (1823); Smith's "History of Nova Caesaria, or New Jersey" (1765); Drayton's "Memoir of the American Revolution" (1821), uncut; Anne Bradstreet's "Poems," third edition (1758); and not less than twenty-one books by the Mathers. A Harvard College book worthy of special mention is the Brinley copy, on thick paper in a special tooled binding of red morocco, of that curious book "Pietas et Gratulatio Collegii Cantabrigiensis Apud Novanglos" (Boston, 1761). This is a collection of thirty-one poems in Latin, Greek, and English by the faculty or graduates of Harvard, written on the death of George II and the accession of George III. These thick-paper copies, according to Justin Winsor, were prepared for presentation to members of the royal family, and were probably sent over to Thomas Hollis, who had them specially bound. The copy presented to George III is in New York city.

Among older English books we may note the following: Froissart's "Chronicles," Lord Berner's translation, Vol. I printed by William Middylton and Vol. II by Richard Pynson (1525); Ben Jonson's "Workes" (1616-1640); Montaigne's "Essays," translated by John Florio, the first edition (1603), with all three leaves of Errata; Chaucer's "Woorkes," the fourth edition (1561); Burton's "Anatomy of Melancholy," first edition (1621); Drayton's "Poly-Olbion" (1622); Donne's "Poems," first edition (1633); Milton's "Paradise Lost" (1668), and "Paradise Regained" (1671); and Wither's "Emblems" (1635), the Brayton Ives copy.

Of English nineteenth century authors notable volumes are: Shelley's "Prometheus Unbound" (1820); Keats's "Endymion" (1818); Lamb's "Tales from Shakespeare" (1807); Thackeray's "Vanity Fair" (1848); and a set of the four numbers of the *Germ*, that very rare periodical published by the Pre-Raphaelite Brotherhood, in which first appeared "The Blessed Damozel" and other poems by Rossetti.

The first editions of American authors are few in number, but several first-class rarities are included. Poe's "Al Aaraaf, Tamerlane and Minor Poems" (1829), described as being uncut, is the most important. A long list of Emblem books; a fine copy (from the Gerald E. Hart collection) of the famous "Nuremberg Chronicle"; books illustrated by Cruikshank; publications of the Grolier Club, Bibliographical Society, and the Caxton Club; a set of Goupil's "Historical Monographs," beautifully illustrated with photogravures; and publications of the Kelmscott and other presses are included.

Many of the books are in very handsome specimen bindings by the best English, French, and American binders.

Part of Edward Everett Hale's library was sold in New York last Thursday. Some of the more important items were as follows: A copy of the privately printed issue of James Russell Lowell's "Commemoration Ode" (Cambridge, 1865), containing an autograph inscription on the fly-leaf reading, "E. E. Hale, with the sincere regards of J. R. Lowell, 3d Sept'r, 1865," sold to "Champlain" for $490; a copy of the privately printed "Poems of Maria Lowell," with Dr. Hale's signature on the fly-leaf, $40; Lowell's copy of the dramatic works of Shakespeare, vols. 3-6 of Whittingham's miniature edition of eight volumes, printed at the Chiswick Press, London, in 1828, to F. W. Morris for $48; a rare broadside, "To all True Southern Men! Shall Kansas be Surrendered to the Abolitionists?" $20; first editions of eight parts of Robert Browning's "Bells and Pomegranates," $61 (F. R. Arnold); and St. Augustine's "De Civitate Dei cum Commento Thomas Valois Nicolai Trivetti," folio, no date or place, but printed by Johann Mentelin at Strassburg, between 1466 and 1468, $77 (order).

Correspondence.

THE CARNEGIE FOUNDATION.

To the Editor of The Nation:

Sir: Some readers may have been led, in the course of recent discussions of the Carnegie Foundation in your columns, into a misapprehension upon one point. It was a satisfaction to find that my letter in the issue of February 3 had elicited President Jordan's illuminating communication. For it appears from Dr. Jordan's statement that the action which the members of the board of trustees intended to take with respect to service pensions is open to somewhat less severe criticism than is the action which was officially promulgated by the president of the Foundation as having been taken by them. Dr. Jordan seems to be in error, however, in supposing that the resolutions of the board, which he cites, have had much to do with determining the actual position officially taken in this matter by the Foundation. The annual report, in announcing and interpreting the recent abolition of the system of service pensions, includes no such qualifying clauses as those which Dr. Jordan mentions. Faint adumbrations of two of these qualifications are, indeed, dimly recognizable in the report; the third (which alone is entirely pertinent to the ethical question raised in my letter) is conspicuous by its absence. The incident seems to throw a certain light upon the internal economy of the Carnegie Foundation; a consideration of the facts thus made manifest may be profitable to presidents, professors, and governing boards in "accepted institutions." The board of trustees of the Foundation is a relatively representative body; but its power of effective control over the Foundation's policy seems more limited than one had supposed.

Arthur A. Lovejoy.

MORRIS HICKY MORGAN.

To the Editor of The Nation:

Sir: For the third time within three years the department of classics at Harvard University has been deprived by death of the services of a distinguished scholar at the height of his powers. Neither Minton Warren nor John Henry Wright passed the limits of middle life, and Morris Hicky Morgan now follows them at the age of fifty-one. These successive losses, while falling most heavily upon Harvard, have grievously impaired the strength of American classical scholarship as a whole.

Professor Morgan's activity in the university was many-sided. He combined to an unusual degree the temperaments of the scholar and of the man of affairs, and in both capacities he rendered able service. Throughout most of his life he carried a heavy burden of administrative work, serving on important committees and taking active part in the deliberations of the faculty. As university marshal he long had charge of formal academic meetings, and gave much thought and labor to the proper conduct of such ceremonies. His interest in the university library, of the governing council of which he was a valued member, will be permanently commemorated by the Persius collection, which he gave to it only a few months before his death. As a teacher he was both exacting and stimulating. Himself the product of strict philological discipline, he maintained severe standards of judgment; but his scholarship was by no means arid or narrow. He had fine literary feeling and power of expression, both in Latin and in English; and his interests comprehended not only linguistics and literature, but also the history, politics, and religion of the ancient world. He was deeply concerned, too, about the adjustment of classical studies to the changing conditions of modern education. In spite of all his responsibilities and routine duties, he found time for many scholarly publications, and he left uncompleted a translation of Vitruvius which, with the commentary that was planned to accompany it, would have been a monument to his learning.

Mr. Morgan was a man of vigorous mind and character, with well-defined opinions

and strong feelings on most of the questions at issue within or without the academic world. In the discussion and settlement of these questions, consequently, he displayed a strong personality; effective in support, where he gave support, and always candid and generous in opposition. As such, he will be remembered with respect by all his colleagues; and by many of them, and of the other men among whom he lived, he will be remembered also with affection as a warm friend, especially to be counted on in times of trouble. F. N. R.

NEWFOUNDLAND FISH.

To the Editor of The Nation:

Sir: All we Provincials are watching the great popular movement now going on in America against the corrupt protectionist rings and the Trusts. How will it end? Is the combination too strong to be broken by the people? Of all the Trusts the worst is the Gloucester Fish Ring. Every one knows that all the fish and herring caught on the west coast of Newfoundland are taken by the natives, and *sold* to the American schooners. This bought fish is passed into the States as *"the sole product of American industry."* Every one concerned knows that it is a transparent falsehood. Taxes on the people's food are opposed to all sound political economy. The result of this excessive tax on fish more than its intrinsic value is to make fish, and especially herrings, enormously dear—250 per cent. higher than they are in Europe. Herrings are the food of the poor all over the British Isles, selling for two cents apiece, whereas in the United States they are never below five cents. If the duties were taken off, Newfoundland and Canada could supply America with any quantity of cheap fish, both fresh and salt. The new "Solling" method of sending fresh fish has been tried here and is a perfect success. Even with the heavy duty an enterprising Newfoundland merchant is sending cod by this method to New York. To us outsiders it seems a most absurd state of affairs that all America should eat dear fish for the sake of the Gloucester ring. The joke of it all is that nine-tenths of the protected fishermen are not Americans, but Provincials. D. W. Prowse.

St. John's, Newfoundland, March 14.

THE KING'S SHILLING.

To the Editor of The Nation:

Sir: In Holberg's comedy of "Erasmus Montanus," the dénouement is brought about by a curious device. In order to correct the disputatious tendencies of Montanus, an officer is made to trick him into enlisting for a soldier. The officer bets Montanus he cannot prove it the duty of a child to beat his parents. Montanus, who can prove anything, has no difficulty with this proposition, and wins the ducat of the bet. Thereupon the officer informs him that he is enlisted, for whoever has received the King's money is his soldier. (Act V, scene ii.) According to John Ashton ("Social Life in the Reign of Queen Anne," chapter xxxix), this method for obtaining recruits was resorted to in Marlborough's England:

The Queen's shilling, once being taken, or even sworn to have been taken, and attestation made, there was no help for the recruit, unless he was bought out.

The author refers to Farquhar's "Recruiting Officer," in which Sergeant Kite plays the same trick as the lieutenant in "Erasmus Montanus." He persuades two drunken countrymen to receive the Queen's portrait in gold, and then declares they are enlisted, for they have received a gold angel of the Queen's money. (Act. II, scene iii.) Farquhar's play was presented in April, 1706, during the period of Holberg's stay in England. Holberg's faculty for assimilating foreign literatures is well known. Peder Paars is an obvious son of Gulliver. The borrowings from Molière are innumerable. It is interesting to suppose that Holberg may have taken his suggestion for the lieutenant's trick from a play seen or read in England.

Joseph Warren Beach.

University of Minnesota, March 16.

VIRGINIA AND SECESSION.

To the Editor of The Nation:

Sir: In your notice of Mr. B. B. Munford's book, "Virginia's Attitude Toward Slavery and Secession," occurs the following sentence: "If, as Mr. Munford insists, Virginia seceded simply because the Federal government resorted to coercion, the conclusion is unavoidable that the State preferred to continue on a low social plane under its own guidance rather than to attain an admittedly higher one by Federal aid." The present writer does not pose as any violent champion of secession, but he cannot see that the conclusion you draw is unavoidable. If, as Mr. Munford insists, and as you admit, for argument, Virginia seceded merely because of coercion, she would have continued to emancipate her slaves and would probably have emancipated them in larger numbers when free from the irritation of partisan struggle within the Union. The sentiment of Virginia before 1833 is suggestive of what it might have been again under quieter conditions.

Also, instead of consciously preferring "to continue on a low social plane under its own guidance," Virginia might not have realized that remaining in the Union would have been attaining a "higher one by Federal aid." She might believe that the Republicans were telling the truth in their promise not to interfere with slavery in the States, or she might not believe them and suspect that slaves were to be freed, not by Federal aid, but by Federal compulsion.

The conclusion you draw does not, therefore, seem unavoidable. The case did not present itself to Virginia as simply a case of a lower or a higher plane of life. The lower plane might remain should she stay in the Union, the higher plane might be found if she went out. No one knew.

D. R. Anderson.

Richmond, Va., February 21.

"WORDSWORTHSHIRE."

To the Editor of The Nation:

Sir: Again and again and yet again, in lectures and essays on the literary associations of the English Lake District, and in popular books of travel, one hears or reads the statement, "'Wordsworthshire,' as Lowell called it." But did he? If so, where? Not, certainly, in his essay on Wordsworth. He uses the word there, to be sure, but the context shows that by it he meant the mental domain of William Wordsworth rather than any particular locality. The passage runs:

If we consider carefully where he was most successful, we shall find that it was not so much in description of natural scenery, or delineation of character, as in vivid expression of the effect produced by external objects and events upon his own mind, and of the shape and hue (perhaps momentary) which they in turn took from his mood or temperament. His finest passages are always monologues. He had a fondness for particulars, and there are parts of his poems which remind us of local histories in the undue relative importance given to trivial matters. He was the historian of Wordsworthshire. This power of generalization (for it is as truly a power of generalization) is what gives such vigor and greatness to single lines and sentiments of Wordsworth, and to poems developing a single line of thought or word. It was this that made him so fond of the sonnet.

As this is sufficiently unambiguous, how does it happen that so many seem to misread it? The explanation is, I think, simple: in the introduction to his account of the Lake District, in Baedeker's "Great Britain," Mr. J. F. Muirhead wrote:

Readers need scarcely be reminded of the Lake School of Poetry. Wordsworth in particular has made the district his own ("Wordsworthshire," as Lowell calls it), etc.

This was conveyed by Dr. Rolfe into "The Satchel Guide" in this form, "'Wordsworthshire,' as Lowell aptly calls the English Lake District"; and the statement is merely repeated by those who depend on their guide-books for their erudition.

Wm. Dallam Armes.

University of California, February 24.

To the Editor of The Nation:

Sir: I could not have "conveyed" (does Mr. Armes use the word in the Elizabethan sense?) the term "Wordsworthshire" from Baedeker's "Great Britain," which I had not seen, if indeed the book was published, before I quoted it in my "Select Poems of Wordsworth," 1889, after having used it in a lecture on Wordsworth at least ten years earlier.

I probably took it from Lowell's essay on Wordsworth, where I still think it has a distinct reference to the Lake district. Lowell has just said that parts of Wordsworth's poems remind him of "local histories"; and he adds: "He was the historian of Wordsworthshire." I can see that the context may also suggest a figurative reference to the poet's "mental domain," so intimately connected with his home and his works, as well as to the geographical locality which has given him his title as a "Lake poet." I have no quarrel with those who may not agree with me. I am quite sure that I sent Lowell a copy of my book, with the leaf turned down at the page, and that he made no objection to my giving him the credit of coining the word and applying it to the district.

W. J. Rolfe.

Cambridge, Mass., March 16.

G. P. R. JAMES.

To the Editor of The Nation:

Sir: I think Mrs. Roger Pryor's recollections of my father (G. P. R. James) must

be a little colored. I never heard him use the expression "By George!" which in her "Reminiscences" she puts into his mouth at every turn. If "Jove" or "Jingo" were substituted for "George" (his own name), it would be a shade more characteristic; but he was not addicted to asseverations of any kind.

I remember Gen. Pryor well. I do not think he had the reputation of being a very extreme fire-eater, at Richmond. The Potter bowie-knife incident may have given it to him in the North. Mrs. Pryor seems to say that he never owned slaves, and therefore was not likely to be an extreme apostle of slavery—only a Virginian who "went with his State." C. L. JAMES.

Eau Claire, Wis., March 22.

Literature.

A COMPANION FIGURE TO LAFAYETTE.

The Life and Memoirs of Count Régis de Trobriand, Major-General in the Army of the United States. By his daughter, Marie Caroline Post. New York: E. P. Dutton & Co. $5 net.

When after the death of Gen. de Trobriand the Loyal Legion of the United States declared in their resolutions in his honor that he was the only native of France except Lafayette who had attained rank so high in the service of the United States, no mistake was made in mentioning the two men together. Both were members of the *haute noblesse;* both became imbued with the American spirit; each at a great crisis of our history upheld with his sword the cause of the United States. Though the name of Lafayette is more familiar to American ears than that of de Trobriand, his service to our country was probably no more able and unselfish than that of the later champion. Lafayette returned to play a great part in his native land; to de Trobriand the door was open to a similar course, in the crisis, so terrible for France, of 1870. He preferred to remain an American, giving his years of vigor to the country he adopted. Had he followed the precedent of Lafayette, one feels he might easily have risen in the old world to a similar leadership. The merits of this fine character have been obscured, and it is fortunate that they are at last set forth in a noble biography.

A family record more picturesque and thrilling than that which Mrs. Post unfolds it would be hard to imagine. The founder of the line, an Irish adventurer on the continent, went back with William the Conqueror. A descendant returned with the Black Prince, in the fourteenth century, to Brittany. He received nobility and estates, among others the fief of Trobriand, and henceforth, so long as monarchy endured, the de Trobriands played a part in the armies. In the time of Louis XV, the grandfather of our subject, in exile from his home, married in Spain the daughter of the Governor of Venezuela, a lady whose nephew was the famous Bolivar, the "Washington of South America." The career of the grandfather was for the most part in the Western world; he returned, however, from exile on the eve of the French Revolution, only to die in poverty and in hiding in Paris, in 1801. The de Trobriands of the next generation, three sons and three daughters, all experienced the most varied and romantic fortunes. The reader finds himself sometimes in an atmosphere like that of "Les Trois Mousquetaires"—of light-heartedness, frivolity, daredevil intrepidity, whether the matter in hand be a trifle or a kingdom. A jostle in a theatre or a jeer in the street becomes straightway an occasion for a duel to the death with rapiers. A stripling de Trobriand, picking his way through the mud in front of the barracks of a rival regiment, hears laughing comments from three officers: "Regardez mademoiselle qui a peur de se crotter les pieds." At once a challenge; the laughers in turn are dexterously stretched out and pay the penalty by a term in hospital. In the cataclysm which overtakes the *ancien régime* the lightheartedness persists, but the *insouciance* deepens into heroism. The same de Trobriand, it was the younger uncle of our subject, was in 1806 an aide of Davout, and carried to Napoleon, at Jena, the news of the victory of Auerstadt—good news for the Emperor, but received with ill-nature by Bernadotte and Ney, who begrudged the glory to a rival. The nonchalance of a mere cub involved in the very whiskers of such lions amuses and amazes. François, the elder uncle, a superb Breton sailor, attained distinction at sea. Sent by the Emperor, in 1809, in a fast-sailing frigate, with important dispatches for Martinique, he ran the gantlet of the entire English fleet. Cutting in two with his prow a ship that threw itself in his path, and exchanging broadsides with the rest, he swept on toward land. There he beached his vessel when capture seemed inevitable, promptly blew her up, escaping, however, with his crew and fully accomplishing his errand. The younger uncle rose to be a general of the Empire. The careers of the three aunts were scarcely less full of adventure.

The most notable career of the six was that of Joseph, the father of Régis. At nineteen, during the Terror, escaping across the Rhine, he took service as an *émigré* with the Austrian army, against the Directory and Consulate. He attracted the attention of the Archduke Charles, had a share in some victories and more defeats, but, always intrepid, won at last a high distinction, the medal of Maria Theresa. The two nations becoming allied after Austerlitz, and the stability of France appearing secure under Napoleon, Joseph took advantage of the amnesty and attached himself to the fortunes of the Empire. His intrepidity was manifest on small occasions as well as great. He beards Murat, when King of Naples, for not inviting him to a ball, and brings him to terms, and even braves the wrath of the Emperor himself in claiming a ribbon promised but long withheld. But all was forgiven to a soldier so brave. He was fearless in every campaign: he soon rose to be general, in 1812 was chief-of-staff of Count Lobau, in Russia, where he endured all but death; he was among the most energetic in fighting off the final catastrophes. He was especially distinguished in 1813 at Lützen and Bautzen. At the latter battle, observing that the Breton recruits, not understanding French, could not obey their officers, he put himself at their head, and, inspiriting them in their own dialect, stormed the key-position obstinately defended, thereby winning victory. Joseph de Trobriand served Napoleon well, bearing on his body no less than eleven wounds.

Régis de Trobriand was born in 1816, at Tours, where his father was in command. The family under the new régime loyally supported the Bourbon throne, received amnesty for the past, and enjoyed their ancient estates and privileges. While still a young child, as a noble who could boast "sixteen quarterings," he was appointed a page to the child who was expected to rule France as Henri V. In 1830, however, the house of Orleans displaced the older branch; the de Trobriands remained firm in their allegiance and fell into disfavor. Since a public career was closed to Régis, his education went on in the ordinary way. He was a good scholar at the University of Tours, and afterward studied law at Rennes. A chance invitation from a friend in 1841 brought him to New York, where marriage with an American heiress fixed his destiny. Had the Bourbon line recovered its place in France, de Trobriand would probably have been among its upholders. His life during early manhood was passed partly in the New World, but sometimes in the Old, especially at Venice, where the Comte de Chambord, "Henri V," in exile, maintained a kind of court. In 1848 the Orleans dynasty came to an end, but without a restoration for the Bourbons, whose hopes waned utterly after the *coup d'état* of 1851.

During these years de Trobriand was a man of elegant leisure. He had great versatility, painted with skill, was accomplished in music, a good amateur actor; above all, a writer, both in French and English, of marked grace and *esprit*, combined with virile force.

In these years of waiting he was a dilettante and man of fashion rather than an earnest striver, but no *faineant*. Once, at Venice, he swam seven miles, then immediately rowed an equal distance against the current, his companion in the feat being the Bourbon pretender "Henri V." He knew the writers and artists of both worlds, by whom he was well received. He undertook in New York the *Revue du Nouveau Monde*, and, when this proved unsuccessful, gave his strength to the *Courrier des Etats Unis*. Here, as a musical and dramatic critic especially, he much influenced the public taste.

The hour struck for de Trobriand in 1861. Under his light occupations, a man of sense and strength, he had studied thoroughly the American crisis, and now at once chose his side, by no means as an unthinking *sabreur* with an itch for adventure, but as a champion well-schooled and conscientious of the cause of the North. For five hundred years and more his line had been one of soldiers. Now at forty-five, he found the opportunity through which he could manfully carry forward the family tradition. As colonel of the Fifty-fifth New York Volunteers, the nucleus of which was the Lafayette Guards, he took the field promptly. He did brilliant service at Williamsburg; then, after prostration by malarial fever, at Fredericksburg and Chancellorsville. On the second day at Gettysburg his brigade held long the exposed angle at the Peach Orchard against the onset of Longstreet. It was withdrawn only when reduced by nearly one-half, the survivors in good heart and cheering their commander as he led them to a new position not less dangerous. On the third day they continued on the left the line of the Second Corps in the repulse of Pickett from Cemetery Ridge. Later, on the Rappahannock, and, in 1864, on the James, he was in the thick of conflicts which might have daunted even his forebears, the doughty heroes of the First Empire. He rose to the command of his division, and to the temporary command of the Second Corps, the strength of his arm lending weight at the very last to the *coups de grace* at Five Forks and Appomattox.

Mrs. Post does not deal in detail with her father's civil war experiences, but refers her readers to his "Quatre Ans de campagnes à l'Armée du Potomac," a work he published in Paris in 1867, designed especially to affect European opinion. The "Quatre Ans" is a most intelligent military record, but has been especially useful perhaps for its lucid vindication, in the introduction, of the cause of the North. Before this work came from the press, de Trobriand had accepted a colonelcy in the regular army, where he did perhaps his most arduous, if not his most dangerous, service, until he reached the retiring age. He was set to curb the Indians in Dakota and Montana, wildernesses then unbroken, where he passed winter after winter in huts upon the bleakest prairies and mountains. Here, while holding in check Sitting Bull, or conducting with perfect success winter campaigns against the fiercest tribes, he filled up the intervals by acquiring the language of the Sioux, so that he could talk to them without an interpreter, and by learning the secrets of the waste. In strange contrast with this life were his occasional leaves of absence, spent in the midst of what is brightest and most refined in New York and Paris. One vacation, however, was for him a dreary time. He was in France, where, the Germans having retired, the days of the Commune were at hand. His acceptance was sought of a high command in France, a place from which, veteran and man of sense that he was, he might easily have gone on to leadership. A pathetic letter of this time shows his heart-break over the misfortunes of his native land, but he could not give up his new allegiance: he remained an American, seeming to feel that in the New World he could best make his manhood tell.

His latest service was in struggling with the Mormon imbroglio in Utah and the Reconstruction disorders in Louisiana. In this rather dismal business his tact and sound judgment were no less conspicuous than had before been his valor in the field. Now and then, circumstances made it proper for him (a rare chance for a soldier) to counter with his pen upon civilian schemers who sought to defy him to the public detriment. His deliverances here are notable specimens of English—rapier-thrusts of polished and stinging sarcasm at the pretensions of his adversaries. The point which, in quieter times, had so often pricked the negligent songsters of the Grand Opera to better work was now fleshed savagely in game of a different feather, the harpies that infest the body-politic.

De Trobriand, after retirement, enjoyed many pleasant years. He was much in New Orleans, much in New York, and especially happy in Paris and the picturesque Breton country in which he was born. Among his intimates were the best soldiers, artists, and *litterateurs*, both of the Old World and the New. He died in 1897, in his eighty-second year—a man naturally gifted and elegantly accomplished, clothed to the last with the best traits of the old *haute noblesse* of his birthland, and yet thoroughly an American who had sealed his faith with the manliest striving.

Mrs. Post has done her work in her father's memory with grace and skill. We hesitate to note as a blemish, the printing of many papers and letters in French without translation. These pages, lucid, and effervescent with the best Gallic *verve*, give fine and appropriate character to the record, and the reading of them will certainly not embarrass greatly the public to which the book appeals. We hope the fascinating story will be taken as convincing proof that in Régis de Trobriand we have for our history a proper companion figure to Lafayette.

CURRENT FICTION.

The Counterpart. By Hornor Cotes. New York: The Macaulay Co.

The civil war story has come to be a rather perfunctory affair of late. Those who, in one sense or other, assisted at the struggle seem to have pretty well exhausted their fund of anecdote and generalization; and the younger chronicler finds himself in a kind of doldrums between, as it were, two favorable "slants of wind." He is neither sufficiently contemporary nor sufficiently posterior to interpret the events of the fateful sixties with freedom. The author of "The Counterpart" has an exceptionally vivid sense of the atmosphere of war days—more than a touch of the warmth and vividness which belong to Mr. Cable's stories of that period. The history and the romance of it are more than commonly well-fused: neither seems to have been introduced for the sake of the other. An impatient reader might object to the Dromio idea upon which the action is founded. "The counterpart" is a young Union staff-officer who is able to act the spy successfully in Richmond at a critical moment through his close resemblance to a cousin who is in the Confederate army, and has been taken prisoner. Of course, he makes love to a beautiful and innocent Southern girl; of course, she scorns him (see cover) when she learns that he is not what he has seemed; and, of course, they are reconciled and united after the war is over, to the satisfaction of all concerned. But no discerning novel-reader to-day will complain that his novel of the moment has the same old plot. The invention of a new combination of circumstance is a cheap if amusing trick. What we really look for with eagerness is the story-teller who can breathe the breath of life into the old immortal matter. The author of "The Counterpart" is not a great story-teller; but he has evidently told this story because it interested him, and not because he thought it was about time he wrote a novel. For so much, and for something more, he deserves our thanks and good wishes.

The Top of the Morning. By Juliet Wilbor Tompkins. New York: The Baker & Taylor Co.

This is a story of "Us," a little group

of writing, painting, modelling folk, who lead the life of private inspiration and social independence which has, one sometimes suspects, greater glamour in print than in reality. It would be only fair to offset Gissing against Du Maurier if one wished to judge of the studio life on literary evidence. However, though the present spectator sees her artists rosily, there is nothing fatuous in her regard for them. The band of intimates which calls itself "Us" includes a caricaturist, a short-story writer, a sculptor, an illustrator, two budding playwrights, and a boy, son of the illustrator. At her flat, every Sunday night, the group gathers; the central figure is Paul, the sculptor, whom they all adore and look up to. An implicit bond of sincerity in life and workmanship secures the little society. Several of them are tempted in one way or another to cut themselves off from the cherished association; but the group remains whole in spite of everything—even the marriage of Paul to an outsider. Charlotte, the illustrator and hostess, and Donna, the young story-writer, represent the modern type of comrade-woman. They enjoy the freest and most unconventional companionship with the members of the group who chance to be masculine. Everybody is My Dear to everybody else, and friendly hand clasps hand regardless of the accident of sex. This is understood to be a very admirable and comfortable state of things: one is glad to gather, as if from the reluctant admission of the author, that even in this happy family of Art, such human emotions as love and jealousy and suffering do eventually intrude. But the wholesomeness of these people, after all our weary experience of the studio bounder and the studio cat, is what we must be most grateful for. It is now more commonly admitted that flabbiness of will and shabbiness of personal habit are not the chosen handmaidens of Art, even as spelled with a capital.

The Screen. By Vincent Brown. New York: E. P. Dutton & Co.

If the Evangelicals seem to have been having it their own way in fiction of late years, that is because their methods are more popular, not to say sensational, than those of the conservative Churchman. But the Churchman has not been idle. Probably few Americans have read or heard of the seven or eight novels by the present writer, which have preceded "The Screen"—all of them breathing the atmosphere of the Established Church. The most grateful thing about the present narrative is its occasional Trollopean flavor. The Lerchester clericals are lineal descendants of the Barchester worthies. The stern and ambitious parson of "Crolly Magna," who becomes Bishop of Lerchester, has many of the traits of our old acquaintance Archdeacon Grantly, and the meek Vicar of St. Saviour's is strongly reminiscent of Warden Harding.

But there is an undeniably sensational element in the plot of "The Screen" from which Trollope would have shrunk. It is, to be sure, the most ancient of sensations. In youth, and before taking orders, the Bishop has betrayed and deserted a good girl. There is nothing disgraceful about her family or breeding, but she does not measure to the standard of his ambition. She bears a son, and is later married to a good man who understands and forgives everything. On her death-bed, she gives her son letters written by his father. Presently the father becomes Bishop of Lerchester. The tendency in his new see has been toward ritual and disestablishment. The Bishop is a Low Churchman, and one of his first acts is to order the removal of a crucifix from a choir screen in St. Saviour's which has been the dying gift of the woman he had wronged. This is too much for the long-suffering son, who, as editor of a local journal, has it in his power to publish the incriminating letters and ruin the Bishop's career. This he threatens to do if the screen is interfered with. Through the intervention of the good old vicar, this catastrophe is prevented. The screen is mutilated, but the Bishop's conscience is aroused, and he resigns his office. The son agrees that he cannot make public confession of his fault, on account of the harm it would do the Church—a position which only the dissenting mind would incline to challenge. The really disconcerting thing to the outsider is the blandness with which this clerical interpreter reports the unseemly squabbles of his clergymen among themselves—the slang and flippancy with which their discussion of Church matters is interlarded. Surely, the present writer exaggerates in representing his parsons shouting for the merits of High or Low Church observance with the gesture and accent of angry drummers.

Peggy the Daughter. By Katherine Tynan. New York: Cassell & Co.

This is a pretty, spinsterly tale of love and sacrifice, such as might have been written for a larger audience a generation ago. If its eighteenth-century speech is a trifle absurd, and its machinery a trifle obvious, it will fare none the worse with the particular constituency to which it is addressed—still a fairly large constituency even in this sophisticated day. Peggy is the daughter of a spendthrift nobleman, who adores the memory of Peggy's sainted mother, but abducts a comely Quakeress for her money. The Quakeress does not mind, having long cherished a hopeless passion for the gentleman. But her father does. Unfortunately, the nobleman shoots one of his pursuers, and what with the business of abducting and the business of shooting, is sent to prison by a harsh judge for twenty years or so. Peggy grows up, and falls in love unwittingly with the son of the harsh judge—a manifest impropriety. But there are ways out of such dilemmas for even the least adroit story-teller, which Miss Tynan is not. How Peggy releases her lover to another woman, how she becomes acquainted with the harsh judge and the other woman, how the other woman in her turn withdraws, and the harsh judge pardons Peggy's father and takes Peggy to his fatherly-in-law bosom—all this is related with a good deal of grace and some fervor. It is very ingenuous, unfeignedly sentimental—the right thing (from one point of view) for the young person—the safe thing for the matron who dreads the nerve-racking influence of the novel in which real life is approached from any point of view whatever.

BABYLONIA AND THE BIBLE.

Amurru, The Home of the Northern Semits. By Albert T. Clay. Philadelphia: Sunday-School Times Co.

There are some archæological problems, which, like the poor, are always with us. One of these is the relation of Babylonian culture to the religion and tradition of the Hebrews. At an early stage in the study of the cuneiform inscriptions, it was recognized that the material unearthed by excavations in Babylonia and Assyria would have important bearings on the myths and traditions of the Old Testament. The finding of creation and deluge stories among the clay tablets of the royal library of Nineveh which bore striking resemblances to the Biblical tales gave an impetus to a comparative study of the religious conceptions of Hebrews and Babylonians, with the result that, owing to the great antiquity of the Babylonian texts, the disposition of scholars was to make the Hebrews borrowers from the Babylonians. The problem, however, soon assumed more complicated aspects, when it became necessary to account for the equally important points of divergence between the Hebrew and Babylonian traditions. Whereas the Babylonian tales were clearly and unmistakably mythical—both the creation and deluge stories representing the conflict of the seasons—in the Old Testament, the general disposition was to minimize the mythical features and to bring the folk-lore of primitive culture into accord with advanced monotheistic conceptions of the government of the universe. The more cautious scholars recognized that since the process involved in thus transforming myths into illustrations of the ethical implications of the teachings of the Hebrew Prophets must have been one of long duration, the Hebrews must have received their folk-lore at a pe-

riod far earlier than the time when they could have come under the direct influence of the literary activity unfolded in the Euphrates Valley.

But while the efforts of this class of scholars are directed towards tracing the independent religious development among the Hebrews of traditions which, in a crude form, they once held in common with fellow-Semites, a vigorous school of investigators has sprung up, who boldly maintain that Babylonia at an early period developed a systematized scheme of cosmology and theology combined, which spread its influence throughout the ancient world, leaving its traces in Egypt, Greece, and even Rome. This school is disposed to attribute to Babylonian influences, not merely the myths and legends of Genesis, but most of the religious ideas of the Hebrews, including Monotheism, which we have been accustomed to regard as a distinctive product of Hebrew thought. The most extreme position is maintained by a group of scholars, chiefly in Germany, who have been dubbed "Pan-Babylonists," and who, like the party managers on the eve of an election, "claim" practically everything for Babylonia. The entire Babylonian religion is resolved into a species of hazy Astral-Theology, which, it is declared, colored the entire culture of the Euphrates Valley; and it is this Astral-Theology which the Pan-Babylonists detect in almost every page of the Old Testament and in many pages of the New, while traces of it are to be found in Greek and Roman religions and even in Islamism. The reaction against such a position was sure to come, and the significance of Professor Clay's new work lies in the fact that it is a symptom of this reaction. The author, whose publication of many volumes of cuneiform texts and researches connected therewith has placed him in the front rank of Assyriologists, reveals himself in this work as a keen and ingenious student of Biblical criticism and of Semitic origins. His main thesis is that, instead of assuming an exclusive influence of Babylonia on the Western and Northern Semites, the indications are that Babylonia at a very early period was strongly influenced by Semites who entered the land from the northwest, and whom, in a general way, he designates as Amorites.

The originality of Professor Clay's thesis cannot be denied, nor the fact that he has amassed a surprising amount of evidence against the current view, which assumes, *e. g.*, that the creation and the deluge stories of the Bible and such institutions as the Sabbath are of Babylonian origin; he also argues plausibly that there are elements in the Babylonian traditions, such as the figure of Timat—the Symbol of Chaos, overcome by Marduk, the God of Light and Order—that betray foreign influence. In regard to the Sabbath, he points out that, whereas the underlying stem of the word is very common in Hebrew, it is virtually unknown in Babylonian. It is actually applied, so far as the present evidence goes, only to the fifteenth day of the month, and does not appear to have had at any time a distinctive religious significance. In all this we are able to follow him, and there can be no doubt that Professor Clay's learned researches and clear discussions will have the result of calling a halt against extravagances on the part of many Assyriologists and of some Biblical critics.

A greater difficulty is felt when we come to the second part of the work, which deals with the evidence for Amoritish influence on the Babylonia-Assyrian pantheon. That the God Adad, whose worship as a storm deity goes back to the earliest period of Babylonian history, is identical with the West-Semitic deity of a similar name, but appearing also under other designations, has long been suspected; but Professor Clay goes much further, in his assertion that some of the chief deities of the Babylonian pantheon, such as Marduk, Shamash, and the deity whose name is conventionally read Ninib, are also of West-Semitic origin. He has, indeed, made out a strong case for one of the designations, the last-named god, as En-Mashter appears on Aramaic endorsements of cuneiform documents of the Persian period. He now identifies the second element as a variant form of Martu, but takes Mash as a designation of the West. The foreign character of this designation is further vouched for by the existence of a place in Palestine as early as the fourteenth century B. C. containing the name of this deity as one of its elements; but to conclude from this that the cult of Ninib, which is closely associated with one of the oldest "Sumerian" settlements in the Euphrates Valley is a foreign importation involves almost insuperable difficulties. The same holds good in regard to Professor Clay's observations on other gods, such as Marduk and Shamash. He proves that foreign influences may here have been at work, without proving that the deities were actually of Amoritish origin.

The chief deity of the Amorites was, according to Professor Clay, a deity of the name Urru, which appears in a number of variations, such as Eri, Urra, etc. The form of the name is allied to the name of the country, Amurru, and, if we understand the author aright, the result of this association of Urru with Amurru is also to be recognized in elements of proper names, like Amar, Mar, Mash.

Following out this thesis, Professor Clay finds traces of the Amoritish deity and of the name of the land Amurru in a large number of proper names, including a number of the so-called antediluvian patriarchs in the fifth chapter of Genesis. It is perhaps natural that a scholar in the first enthusiasm of an important discovery should be disposed to carry his theory too far, and Professor Clay, himself, recognizes that not all of these identifications are to be put on the same level. It is sufficient merit to have opened up new vistas of the ancient culture of the Northern and West Semites; and even if some of the points emphasized by Professor Clay, perhaps unduly, should not turn out to be supports for his theories, enough, and more than enough, remains to substantiate his main thesis that the Amorites entered Babylonia at an early period and brought the worship of certain gods and cosmological and other traditions with them, and that what we designate as Babylonian religion is the result of the mixture of these Amoritish elements with those indigenous to the Euphrates Valley.

We should have liked to see in Professor Clay's work a full discussion of the "Sumerian" question, for his main thesis bears directly upon this vexing problem. Many features in Babylonian culture which have been assumed to be Sumerian in origin or to betray Sumerian influences (such as the name and character of the hero of the Babylonian epic, Gilgamesh) are claimed by Professor Clay for his favorite Amorites. In order to establish his thesis, it would be necessary for him to take up the relationship of Amurru and the Sumerians, and to indicate more definitely the part taken by the Sumerians in the development of the language and script of Babylonia.

Professor Clay's treatment of a difficult and fascinating theme may safely be designated as of the first importance. It will prove stimulating to others and will provoke discussion which—next to the direct contribution to knowledge which Dr. Clay has made—is, after all, the most gratifying recognition that a scholar's work can receive.

Essays on Modern Novelists. By William Lyon Phelps. New York: The Macmillan Co. $1.50 net.

Professor Phelps is by no means a literary anthropophagus. The only person whom he has devoured in this book is a woman—Mrs. Humphry Ward—and that was perhaps to punish her for her recent libel on American life. In the eleven remaining essays he extends a hand of welcome to De Morgan, Thomas Hardy, Howells, Björnson, Mark Twain, Sienkiewicz, Sudermann, Alfred Ollivant, Stevenson, Kipling, and R. D. Blackmore. In general, he belongs to the philanthropic order of critics. If there were no better reason, he would still love the guild of authors for the cleverness they evoke from him; he ad-

mits freely enough that he derives a good deal of fun from the pessimism of Hardy. But a genuine desire to be entertained as well as entertaining underlies his cordiality. In an interesting appendix on "the teacher's attitude toward contemporary literature" he says that a good teacher's sympathies should be warm and keen "when a new planet swims into his ken." He would perhaps be willing to add that the function of criticism is rather to introduce writers than to dismiss them. To excite public interest in the life and works of a new or neglected genius is certainly a gracious activity, and Professor Phelps's engaging manner, brisk style, and pointed anecdote are eminent qualifications for the service. It must be remembered, moreover, that no matter how celebrated and weather-worn a genius may become, there is born every day a new and neglectful public which has never heard of Mark Twain or William Dean Howells.

For the rest of us this volume would have been more serviceable ten or fifteen years ago. Those who are acquainted with the novelists under discussion—and most of the "planets" have passed their meridian—may be diverted by the wit of these essays, but will find little occasion in them for readjusting their judgments. Professor Phelps, as we have suggested, takes neither himself nor his subjects with undue seriousness—Mark Twain possibly excepted. His critical procedure is of a rather happy-go-lucky variety. He is constantly discussing the conduct of fictitious personages as if art and life were all one to him. Endowed with mental alacrity but with little subtlety, he takes the obvious path to the obvious with the gayety of Taillefer advancing to the Battle of Hastings. Unfortunately, however, he shuns the brunt of battle. He announces an important proposition, as if he were about to do some hard thinking on it; a commonplace as if he were about to pluck out its heart of mystery—and then gambols off on another tack. Thus he offers the somewhat startling observation that Mr. Howells is moved by an "intense ethical earnestness"; but, instead of making good the assertion, he plunges at once into a four-page digression on the wickedness of European fiction—particularly the book that he read "last night." When he returns to Mr. Howells it is to declare that this author's artistic creed is realism, with which description he seems to be as well satisfied as if he had said, "Mr. Brown is a carpenter." Nevertheless, in the same breath he adds that Mr. Howells's artistic creed "is perhaps more open to criticism than his creed in ethics." "Agreed!" cries the reader, and waits expectantly for the demonstration. Not a word more on that topic from Professor Phelps. After swiftly dividing the novels into two periods—the first "more purely artistic," the second less so—he gives us an eight-page talk on the people in "A Modern Instance," and a three-page talk on the people in "The Kentons"; then he makes his bow. Such criticism leaves the judgment unsatisfied. It is particularly distressing in the case of writers like Sudermann. Those of us who have sat long in the arena are a little tired of seeing Professor Phelps's lions fed with gingerbread; we are ready for the gladiator to enter.

The Life of the Honourable Mrs. Norton. By Jane Gray Perkins. New York: Henry Holt & Co. $3.50 net.

The literature of feminism receives an agreeable accession in the shape of a careful analysis of the life and work of the beautiful Mrs. Norton, with special attention to her exertions in improving the legal condition of married women in England. It has long been known that George Meredith, whose "Diana" has many qualities and adventures in common with this lady, not only damaged his novel, but departed from the truth about Mrs. Norton in using the merely scandalous story of the betrayal of ministerial secrets to the *Times*. But for some years it has seemed that Mrs. Norton's best chance of immortality lay in the undying opportunity of the accurate to say to the vague in mind that the episode has no foundation. In laying a more positive basis for her memory, Miss Perkins has found occasion to produce a delightful book, lively, and well proportioned, which may easily prove to be the definitive treatment of the subject.

The facts of Mrs. Norton's unsuccessful married life, of her husband's attempt and complete failure to prove that Lord Melbourne was her lover, of their final separation, of her wonderful social influence, and of her indefatigable production of undistinguished literature, are familiar to all. The part of the story less well known is the immediate transformation in her mind of her own sorrows into indignant pity for the general case. She could not divorce her husband because she had condoned his offences. By the law of her day, as long as her marriage was undissolved the custody of her children belonged to their father, who exercised his right with great cruelty, refusing her access to them except under humiliating conditions and causing them to live at a distance from her, in the care of persons unfriendly to her. Her youngest child was accidentally injured, by the neglect, as she believed, of his guardians. Though she was sent for, she arrived only to find him dead. Her misery, not only at this crisis, but in the general situation, is artlessly and convincingly reflected in her letters. It was the law that injured her, and she attacked the law, beginning, naturally enough, with the use of her ready pen in the production of pamphlets, "Observations on the Natural Claims of a Mother to the Custody of her Young Children," and "The Case of the Honourable Mrs. Norton." By her efforts Serjeant Talfourd was brought to introduce his Infant Custody bill, which was passed by the Commons and thrown out by the Lords in 1838. The next year she wrote "A Plain Letter to the Lord Chancellor on the Law of Custody of Infants, by Pearce Stevenson, Esq.," of which Charles Sumner said:

> I think it is one of the most remarkable things from the pen of a woman. The world here does not suspect her, but supposes that her tract is the production of some grave barrister. It is one of the best discussions on a legislative matter I have ever read.

In 1839 the bill became law. While Lord Cramworth's bill to amend the Law of Divorce was under discussion in 1854-7, Mrs. Norton was active with tract and epigram. "With its really great reforms," says Miss Perkins, "the doing away with divorce by special Act of Parliament, and with the cumbrous old expensive machinery of Doctors' Commons, it would be absurd and untrue to say that Mrs. Norton had anything to do. This was indeed a measure so sharply demanded by the time that even a great war could not delay it. But the bill contained a whole cluster of lesser reforms. . . . With all these reforms it is quite fair to believe that Mrs. Norton had a great deal to do, to believe even that without her eager crusade of tongue and pen to advance them, the bill would have gone through without them, and the many women who have since benefited by them would have gone on, it may be for many years—for these reforms are slow in coming—suffering injustice without them."

Wanderings in the Roman Campagna. By Rodolfo Lanciani. Boston: Houghton Mifflin Co. $5 net.

This volume is the latest of a series of five by the same author, which began as far back as 1886 with the publication of the elaborated Lowell Institute lectures on "Ancient Rome in the Light of Recent Discoveries." That was virtually the introduction of Comm. Lanciani to the English-speaking world. He brought what the intelligent republic of readers had not before enjoyed, the story of the modern achievements of archæological science in the capital of the world, told by an active worker in the field, who did not hesitate to say *quorum pars magna fui*, and told in lively and fluent English. The publishers wisely coöperated in the mission-work by contributing profuse and costly illustrations and excellent type and press-work to the printed form; and the suc-

cess of the undertaking and its continued appeal are attested by the repeated printings of the earlier volume, and by the addition at not too speedy intervals of new numbers to the series. This latest volume is not to be the last, for unless untimely fate forbids, the author will give us another on sites of the Campagna as yet unvisited under his literary guidance.

The present tour is, in successive chapter-stages, to the Land of Saturn, of Horace, of Hadrian, of Gregory the Great, of Cicero, of Pliny the Younger, and of Nero. The Land of Saturn is the Roman Campagna in general; that of Horace centres about Tivoli and the valley of the Anio above it; Hadrian's Land is that around his great Tiburtine villa; Gregory's (a less convincing appellation) is that of the villages of S. Gregorio, Casape, and Poli, between Tivoli and Palestrina, unrecognized of Baedeker; Cicero's is, of course, Frascati and Grotta Ferrata; and the Land of Pliny and Nero is the Latin coast, from Ostia to Antium. Around and about all this delectable region Lanciani lets his exuberant and vagrant fancy wander, and if that tricksome Puck chooses to divagate into distant quarters of the globe, his amiable master is at no pains to recall him. Hardly have we set foot in the Land of Saturn, when the allusion to Roman country-seats suggests travel, and in a twinkling we are snatched away from sunny Latium to the bleakness of the Alps to examine in detail the passage of the Great St. Bernard. A mention of Latian summer-resorts drags in its train an enumeration of various watering-places between Dan and Beersheba. The oracle at Praeneste is the text for a chapter, fresh from the classical dictionary, on various other oracles from the times of Dodona and Delphi onward to the present-day dream-book. Such meanderings weary the reader infinitely. It is worse than a Cook's tour, and much of the proffered information in these side-trips is not only disturbing, because heterogeneous and out of place, but it is not so well and accurately put as in the reference books where it belongs. The incoherence in this book is more marked than in that which preceded it, as it was there more marked than in the antepenultimate volume of the series.

But rhetorical structure is not the whole framework of a book of this sort. It is an historical work, and must be judged as an historical work. History ought certainly to be something far more lively than a museum-ossuary of naked facts. But the facts, even if not naked, ought to be facts. And Comm. Lanciani is altogether too often superbly disregardful of facts. He is blessed with "temperament," and "temperament" appears to be incompatible with commonplace precision. A few instances out of many must suffice for warning. "The Plinii," says Comm. Lanciani, "born as they were on the shores of the most beautiful sheet of water in Italy, had chosen a naval career." Who would imagine from this that we know only two Plinii of that family, him of the "Letters" (whom Comm. Lanciani concedes to have broken the family tradition) and his uncle of the "Natural History," whose "naval career" was much like that of the admiral in "Pinafore"? Our genial romancer tells us that Silius Italicus starved himself to death in an "ex-Ciceronian villa," which, he proceeds to argue, was none other than the famous *Tusculanum*. Unfortunately, the letter of Pliny that forms our only source of knowledge on the matter says that Silius died in his house near, or in, Naples; and there is no evidence that this particular estate ever belonged to Cicero. Even the inscription on which Comm. Lanciani builds his pretty imagination, in such total disregard of Pliny's statement, was said by De Rossi to have been found not near the spot where Comm. Lanciani (probably wrongly) places the *Tusculanum* (near Grotta Ferrata), but quite on the other side of Frascati. Comm. Lanciani tells us that Cleopatra and her husband visited Cæsar in Rome in 44 B. C., "where the dictator offered them hospitality in his own house on the Sacra Via. The result of this intimacy was the birth of a child to whom the tell-tale name of Cæsarion was given," etc. But the ancient authorities beg leave to differ. Cæsarion was born in 47, the visit was in 46 or 45, and the guests were quartered in Cæsar's gardens across the Tiber. But perhaps the most striking instance in which the author's imagination runs riot, through many pages, is the radiant discourse about Cynthia, Propertius's light-o'-love. Not only is the lady herself made into a solid historical character, but she is awarded a villa at Tibur, with Quintilius Varus next-door on the one side and Catullus on the other. Here she conducted a brilliant salon, frequented, of course, by her neighbors, Varus and Catullus, and by Virgil, Horace, Mæcenas, Tibullus ("who used to drive over from Pedum"), Ovid, Sulpicius Quirinius, Gallus ("conqueror of the Soudan," narrator—ah, poor Tartarin!—of his "exploits in the region of Khartoum"), and even, it is hinted, perhaps by Augustus himself. We are furthermore assured that "the well-known line of Horace [Sat. i, 5, 48] seems to refer to a scene actually enacted on the [tennis] court of the Tiburtine hostess," whither the author has transferred it, one need hardly remind the reader, from the Capua in which Horace himself ventured to place it. "Virgil and Horace," asserts Comm. Lanciani, "cannot have been brilliant companions. One suffered from *angina pectoris*, the other from eyes *lippi et defluentes*"; but we certainly could have overlooked their dulness in the interest of seeing Catullus and Ovid hobnob together in defiance of mere chronology. The House-boat on the Styx must be regarded as a poor substitute for "the cottage of Cynthia, located on the right bank of the river on the Quintiliolo road, near and under the suburban monastery of Sant' Antonio."

Fifty Years of New Japan. Compiled by Count Shigenobu Okuma. Edited by Marcus B. Huish. 2 vols, pp. 646+616. New York: E. P. Dutton & Co. $7.50 net.

An executive committee of four carried out the plans of fifty-five able men, who, incarnating the spirit of nationalism, made the new Japan. Okuma was not one of the four, but he has stood very near the front and well among the leaders of the Restoration of 1868. In length of service to his country, whether in or out of office, and as a potent influence in the growth of "the rejuvenated nation," he holds first place. He is the directing spirit of the Waseda University in Tokio, and of great educational, literary, and political movements, that are slowly but surely remaking the nation. By this monumental book, the fifty-six chapters of which have been contributed by almost as many authors, he signalizes the completion of a half century of the new national life, of which he has himself been a great part.

As the contributors wrote independently upon subjects which have, in most cases a common foundation, there was much overlapping in the original Japanese work, but the translators, supervised by the master, Capt. Frank Brinkley, have done their task with creditable skill. In the English edition repetition has been largely, but not wholly, eliminated.

In volume first, we have politics, finance, industry, and trade treated of in detail; in the second, religion, literature, culture and education, philosophy, medicine, philanthropy, art, social influences, and the progress of Yezo and Formosa are considered. Among the contributors Okuma, Ito, Yamagata, Keiki (the ex-shogun), Shibuzwa, and others of elder fame, are naturally more numerous in the first volume. The younger men of science and of Christianity and other religions, and the students who, gaining knowledge abroad, have applied this to administration and material development are noticeable in the second volume. The spirit of Count Okuma, however, informs the whole work, and his faults and virtues have been consciously or unconsciously imitated by his fellow penmen. There are certain things about which a foreigner wishes most to know, which Okuma will not touch with his little finger—for in-

stance, the elevation to citizenship of the social outcasts, which was in its way quite as remarkable as the emancipation of black slaves in America. He accepts the divine theory of Mikadoism and the nursery notions of chronology with a naïveté that would be delightful were it not so serious a matter. The Japanese will never be considered the intellectual equals of Westerners, until they realize how young their nation is and how utterly worthless as history are their traditions that antedate the fourth century. The Count, however, acknowledges the complexity of the ethnic composite. "Perhaps no other nation on the earth's surface," he says, "has incorporated a greater number of racial types than the Japanese."

The Count divides Japanese history into four parts, patriarchy, transition, feudalism, and modern constitutional government. As for the codes of law, the first, in A. D. 701, was for the nobles; the second, in 1232, for the knights, or samurai; and the third, in 1880, for the people.

One of the most striking papers is from Keiki, the ex-shogun, who, resigning office and power in 1868, still lives in hale old age in Tokio. In luminous manner he justifies his ancestors, declaring that much of the modern spirit of Nippon is but a development of what Iyeyasu formulated in the early seventeenth century. The discussion of "The Influence of the West Upon Japan," by Dr. Nitobe, is not only a superb piece of writing in English, but is rich in that polished satire in which this philosopher delights. Baron Tsuzuki, who has studied etiquette at many courts and nations, recapitulates the facts and declares that "neither difference of race, nor that of religion, nor of country constitutes any real obstacle to the future development of intimacy between ourselves and Westerners." The chapter on Socialism shows a considerable movement with an indigenous literature; with the extension of the limits of suffrage, this propaganda seems likely to become a powerful factor in Japanese politics. The various papers on the material aspects of modern Japan have been in a measure anticipated by the book edited by Mr. Stead a few years ago.

There is acknowledgment of the services of such Americans as Eldridge, Ashmead, James, Verbeck, Brown, Hepburn, and Veeder. Dr. "Bayley," to whom is credited the reform of the prisons in Japan, but about whose first training in Japan of women nurses nothing is said, is no other than Dr. John C. Berry of Worcester, Mass. Commodore Perry's expedition is described as "a peaceful mission of international fraternity," his treaty of twelve articles "having not even a covert reference to trade." His "simplicity was the key to success," and his policy was "as adroit as magnanimous." Townsend Harris, who obtained trade and residence for aliens, advised the Japanese against opium to their eternal gratitude. Two great factors in Japan's advance have been the help of the United States and British sympathy. With map and index, the text presents a marvellous picture of progress in a nation which is in a large sense the epitome of both Orient and Occident, and is endowed with a unique and apparently inexhaustible genius for selection of what it wants from the world's storehouse.

The Spirit of America. By Henry van Dyke. New York: The Macmillan Co. $1.50 net.

This volume is made up of the more important lectures which Dr. van Dyke delivered last year, at the Sorbonne, on the Hyde Foundation. It is the first time, we believe, that Dr. van Dyke has written specifically for export, and the result is that a genial and popular writer appears in an oddly unfamiliar guise. It is as if he had studied the French academic manner, its lucidity, its avoidance of emphasis, its tendency to dryness, with the intention of showing the Parisian student that the American professor knows the scholastic game. Of course, there can have been no such conscious intention, merely the insidious hypnosis of intellectual Paris, but the result is odd. A naïve devotee of Dr. van Dyke's customary manner might have a misgiving that this time he is translating from the French.

With this general reservation, the book contains much that is keen and sensible. Self-reliance, a sense of fair play, and democracy, an exceptional will power, a desire for common order and coöperation, zeal for education, a strong religious spirit—these are selected as the chief ingredients of the American soul. Dr. van Dyke is aware of the paradoxes involved in some of these affirmations. In a foreign cathedra, he naturally minimizes the disorder that prevails within the order which he describes. For that patriotic course no one can blame him, but that policy leaves notable gaps in his analysis. The maladjustment of intellection—of criticism in the broader sense—to will power, our eminently British habit of muddling strenuously, is barely hinted at in the text. More surprising is the failure to emphasize our peculiar versatility and temperamental resiliency. This is not comprised in energy, but in a mobile and imaginative habit of thought. It is the positive and attractive side of what Henry James deplored as our "formlessness."

On the whole Dr. van Dyke's plea *pro domo* is rather amiable and reassuring than able. It may help to offset the impression of such journalism as Paul Bourget's and Jules Huret's. It will show that Mr. Kipling's grotesque caricature is not to be taken at its face value. But as usual, the cartoonist catches essential traits in a more racy spirit than is vouchsafed to the judicious observer. The final essay on self-expression and literature is so thin and cataloguish that one must regret it was reprinted. On the lecture platform, it may have served its turn acceptably.

Notes.

E. P. Dutton & Co. announce the publication of fifty-three new volumes in Everyman's Library.

Houghton Mifflin Company will publish early in the autumn a new life of John Brown of Harper's Ferry, by Oswald Garrison Villard. Mr. Villard has used original documents, contemporary letters, and the testimony of living witnesses and has drawn from such sources much new and significant matter bearing upon this subject.

"Land and Labor: Lessons from Belgium," by B. S. Rowntree, the author of "Poverty: a Study of Town Life," will soon be published by the Macmillans. The book will describe in detail the Belgian system of land tenure, the industrial conditions of that country, and the reasons for the prevalence of low wages; agriculture and the relative value of large farms and small holdings; market gardening, technical education, coöperation, agricultural credit, and other subjects.

The spring publications of L. C. Page & Co. include the following: "In Unfamiliar England," by Thomas D. Murphy; "Susan in Sicily," by Josephine Tozier; "The Boston Museum of Fine Arts," by Julia de Wolf Addison; "Kilmeny of the Orchard," by L. M. Montgomery; "Commencement Days," by Virginia Church; "My Heart and Stephanie," by Reginald Wright Kauffman; "A Cavalier of Virginia," by G. E. Theodore Roberts.

The Frederick A. Stokes Company announces the following publications for spring and summer: "The Spiritual Unrest," by Ray Stannard Baker; "The Religion of the Future," by Charles W. Eliot, president emeritus of Harvard University; "The Enchanted Island," by Alfred Noyes; "How to Study the Stars," by L. Rudaux; "Thurston of Orchard Valley," by Harold Bindloss; "Cab No. 44," by R. F. Foster; "The Living Mummy," by Ambrose Pratt; "A Disciple of Chance," by Sarah Dean; "Rosamond the Second," by Mary Mears; "The Gold Trail," by Harold Bindloss; "The Fresh Air Book," by J. P. Müller; "My College Days, a Record," "My School Days, a Record," designed to be complete and worthy records of all that occurs during college and school life respectively; the Twentieth Century Science Series—"Telepathic Hallucinations," by Frank Podmore, M. A.; "Races of Man and Their Distribution," by A. C. Haddon, Sc.D., F.R.S.; "Physiology, the Function of the Human Body," by Dr. Andrew Wilson, F.R.S.E., etc.; "Evolution from Nebula to Man," by Joseph McCabe; "Geology," by George Hickling; "Prehistoric Man," by Joseph McCabe; "Masterpieces in Color," edited

by T. Leman Hare; "The Child's English Literature," by H. E. Marshall.

The Dent-Putnam series of Classiques Français is enriched by the first volume of the "Fables de La Fontaine"—a charming edition. In his preface the editor, Jules Ciarctie, agrees with those who think that La Fontaine is one of the authors given to children to learn at too early an age. Yet he adds immediately that memories grow sweeter with the years, and "La Fontaine est l'auteur favori des hommes qui ont vécu leur vie. Il les rajeunit en leur rappelant ces heures enfuies où ils épelaient 'leur fable' pour la fête des grands parents ou la récitaient comme un devoir devant leur professeur." After all, is not one of the proper tasks of youth just to lay up such memories for the transmuting power of the alchemistic years?

The single section of the "New English Dictionary," from Romanity to Roundness, edited by W. A. Craigie, is comparatively free from those sapless Latin polysyllables which make portions of the best of dictionaries oppressive reading. Impressionistically speaking, it exhales an odor of "roses" and "romance." For instance, there is the plant vulgarly known as sundew, but christened by the early botanists "rosa solis," a name worthy of the first nomenclator; there is "Rosary," the title of a mediæval treatise on alchemy, by Arnoldus de Villa Nova, cited by Chaucer as "Arnold of the new town"; and there is the mystery-fraught "Rosicrucian," supposedly from Christian Rosenkreuz, reputed founder of a fifteenth century society first mentioned in 1614. And then there is "rosemary" for remembrance and Elizabethan feasts and bridals and funerals, and also for a trap to the popular etymologist—a word at once suggesting the rose and the Virgin, but historically connected with neither, being derived from *ros marinus*, sea-dew. Finally, there is the fragrant phrase "under the rose," which one would like to relate to the "Romante of the Rose," and the sworn secrecy of the mediæval lover or to the *multa in rosa* of Horace; but, says the lexicographer, the expression probably originated in Germany, the first recorded appearance in English is in the State Papers of 1546, and in 1730 Fielding gives it an unromantic Teutonic interpretation: "The rose is ever understood over the drinking-room and the glass is the surest turnkey to the lips." Of recent and interesting origin is "roué" from *rouer*, to break on the wheel; "the name was first given to the profligate companions of the Duke of Orleans (c. 1720), to suggest that they deserved this punishment." It is surprising to find how long before the battle of San Juan Hill the "rough rider" had been put to picturesque uses: thus Emerson in the "Conduct of Life" has "these rough riders—legislators in shirt-sleeves"—one had almost substituted "Khaki"; and Peter Pindar in 1791 writes: "That every Subject ought to wear a Saddle O'er which those great Rough-Riders, Kings may straddle." In Andrew Clark's edition of the "Sbirburn Ballads" (p. 274), we note an example of the nautical "round-house" some twenty-five years older (c. 1601) than the first example in the "Dictionary," and with somewhat different meaning. We also note the omission of the word "ropalic," a curious kind of verse to which Sir Thomas Browne gives a few pages in "Certain Miscellany Tracts."

From a literary point of view the most important article in the section should be that on "romantic"; for the history of the development of taste during two centuries might be epitomized in a carefully written semasiological account of this single word. We, therefore, regret to say that the article is disproportionately short—little over a column—and otherwise disappointing; the illustrations are inadequate in number and uninstructively arranged, and some of the definitions are almost imperceptibly differentiated. Without going farther afield than the familiar textbooks one can easily improve upon this scanty outline. For example, T. S. Perry long ago pointed out in his "English Literature in the Eighteenth Century," a case of "romantic" in Evelyn's "Diary," 1654, five years older than the first case in this article and fifty-one years older than the first case cited under the appropriate definition. In Temple's essay, "On Ancient and Modern Learning," 1690, there is a striking passage in which a Spaniard attributes the ruin of Spain to the decay of "Romantick Honour and Love," caused by "Don Quixote"; this anticipates the passage here quoted from Rowe by ten years. Again, Professor Phelps cites Pope in a letter of 1716: "The more I examine my own mind, the more romantic I find myself . . . let them say I am romantic; so is every one said to be that either admires a fine thing or praises one" ("English Rom.-Movement," p. 18). This astonishing utterance does not exactly come under any of the definitions. Throughout the greater part of the eighteenth century the word develops parallel with "enthusiastic"; it contains a personal judgment as well as a meaning; and even with the context the judgment implied may be doubtful unless the author is known. That is, what appears to a Warton romantic and therefore adorable, may appear to a Johnson romantic and therefore detestable. This aspect of the matter receives little illumination from the "Dictionary." Furthermore, the treatment of later formations, such as "romanticism" and "romanticist" is likewise unsatisfactory. The first case of "romanticist" given is from "Blackwoods," 1830. Carlyle's article on the "State of German Literature," published in the *Edinburgh Review* three years earlier, contains the following: "Their grand controversy, so hotly urged, between the *Classicists* and *Romanticists* . . . ."

The well-known Italian journalist, G. Piccini, who writes over the pseudonym "Jarro," has recently produced "Memorie di una prima Attrice" (Florence: Bemporad). The leading actress is Laura Bon, contemporary and kinswoman of Ristori, of whom the survivors of the older generation still speak with great enthusiasm. She was, indeed, a tragédienne of remarkable talents, who seemed destined to reach the summit of her profession. But unfortunately, when she was only twenty-three, her great beauty and charm attracted Victor Emanuel, who became her protector and for several years would not permit her to act. Subsequently, being displaced in his favor by Rosina, she returned to the stage, where she continued to enjoy great popularity. But her spirit was broken, and she failed to win the highest honors in her art. The last twenty years she spent in neglect and poverty, dying in 1904 on the verge of four score. Piccini's volume has more interest for the historian than for the student of the drama, because he describes in detail the political influence which Laura Bon exerted during the days when she was the royal favorite. Long after Victor Emanuel broke off his relations with her, he used her on secret political missions: notably in 1864, when he sent her to Verona and Vienna to see what chance there was for the Italians to recover Venetia. She went and acted in those cities; interviewed even Marshal Benedek himself; got the desired information, but excited no suspicion. As portrayed by Piccini, she was a woman of rare native nobility, blasted by royal favor which she tried to escape.

To students of mediæval agricultural and legal conditions the word of the Corpus Professor of Jurisprudence at Oxford has come to be recognized as authoritative. Professor Vinogradoff, in a readable and untechnical little volume of only 135 pages, has written an excellent sketch of "Roman Law in Mediæval Europe" (Harper's new Library of Living Thought). The book grew out of a course of lectures delivered in the spring of 1909 to an advanced class in the University of London. The author traces, in a couple of chapters, the decay of Roman law and the revival of jurisprudence, then, in three chapters, discusses the extent to which Roman law was "received" in France, England, and Germany. Contrary to the older view of the disappearance of Roman law in the so-called Dark Ages after Justinian, the author agrees with those who maintain that there was a constant, though thin, stream of legal learning running through the darkest centuries, that is, from the fifth to the tenth. The existence of organized law schools is not proved, nor can there be any talk of a very active development of individual thought. But transcripts and abstracts from the fragmentary materials bequeathed by antiquity were made and studied in the scriptoria of monasteries and the classrooms of teachers of the arts. Especially interesting and new to many will be the author's description of the recently discovered summary of the Justinian Code known as *Lo Codi*. This was compiled about 1149 in Provençal for the use of judges in Provence; it is the earliest treatise on Roman law written in a native dialect. The Provençal text is soon to be published by Professor Suchier of Halle. Vinogradoff discusses Azo's influence on Bracton, and thinks that "the infusion of Roman doctrine made the legal treatment of villainage harder than might have been the case otherwise." This may possibly be true for England, but hardly so for Germany to any extent before the end of the sixteenth century. Perhaps the most interesting thing about the history of Roman law in the Middle Ages is the strong testimony it affords of the latent vigor and organizing power of ideas in the midst of shifting surroundings. Professor Vinogradoff has done a really valuable service in sketching the outline of a fascinating and important subject. He has not, of course, attempted to trace the history of Roman law in all its details or even

in all its stages, hut merely to eharaeterize tho principal epoehs in its development. Heretofore there has been nothing up-to-date of this kind in English; for Sohm's "Institutes of the Roman Law," while fulier in the treatment of the Italan schools, has nothing to say of Franee and England.

A small book of great interest to students of polities and government is one entitled "Indian Speeches" (Maemillan), by Viscount Morley. These speeehes, delivered during the years 1907-1909 hy the British Secretary of Stato for India, are especially timely in view of the perplexities in the Indian situation and the efforts now made to introduce real reforms. Thc limited public that is following Indian affairs with intelligent attention will find much of value in "this small sheaf of speeches," which, with no rhetorical pretensions, eontains some of the prudent and necessary eonsiderations that have guided the recent reform movement. In addition to the speeehes, three cardinal State papers have been appended which mark at successive stages, for three generations, the spirit of British rule in India.

"Lotus-Buds," hy Amy Wilson-Carmiehael (A. C. Armstrong & Son), is the poetie but apt designation of the Hindu ehildren deseribed in this hook. The writer is at the head of a nursery established by an English missionary society, where are plaeed ehildren who have been in danger of heing sold into depraved service in the temple—for it is impossible to rescue them when once they are in the temple house. To draw attention to the evil (which, it should he said, is a travesty of religion revolting to every high-minded Hindu) in order that some means may he found to eradicate it, she wisely begins by awakening the interest of her readers in the babies under her charge. This she does in a series of delightful word pictures of them and their deeply affectionate and fascinating ways. Though only from two to four years of age, they show a remarkable intelligenee and wonderful grasp of Bihle stories and preepts far in advanee of most Western ehildren of the same age. In her deseriptions of the little ones she sometimes tells the story of their rescue from a threatened evil life. Word comes, for instance, that a hahy in a distant village is in danger of being sold. Immediately there is sent to the place a native Christian woman who strives to induee the parents to put the child in the nursery. Often she is unsueessful and again she may have to wait for months before a final deeision is reaehed. Information in regard to the "secret traffie," its nature and extent, drawn largely from hlue hooks and testimony published in the Indian papers, is given in the closing chapters. They show also very clearly the difficulties in the way of repressing it, as it has become a vital part of sacred praetice of the Southern Indian, and the government maintains a striet neutrality in all religious matters. The attraetiveness of the hook is greatly increased hy fifty photogravures, mostly of the children deseribed in the text.

A journey in that "enchanted garden men call Java" is described hy Henry G. Bryant in the *National Geographie Magazine* for Fehruary. Especially interesting are the accounts of the wonderful temple ruins, one of which is "probahly the largest Buddhistie edifice in the world," with 988 bas-reliefs in a good state of preservation, illustrating the life story of Buddha, and 441 images of the god each within a smail dagoha or shrine of its own. Entirely different and of far greater antiquity is the Hittite capital in Asia Minor of which Prof. Isabel F. Dodd of Constantinople gives a description. Among the sculptures reeently diseovered, three or four thousand years old, are the star and eresecnt and the douhle-headed eagle. B. Willis, delegate from this country at the international eonferenee held in London last November to agree upon details of the standard map of the world, gives the conclusions reached hy the delegates. For Europe all the data for making a one-millionth, or sixteen miles to the ineh, map are complete, and it prohably will soon he published, hut it may be ten years hefore the map of this eountry will he eompleted. The difficulty in regard to the names of places is illustrated by the fact that nearly all Hungarian towns have two names, one Hungarian and the other German, and some of them have as many as five names, all of which are eurrently used hy the distinct elements of the population.

Born of an Irish peasant family, the hero of "From the Bottom Up: the Life Story of Alexander Irvine" (Douhleday, Page & Co.), has been successively British marine, emigrant, elevator man, theological student, clergyman in several denominations, author, investigator of convict camps, trade unionist, and finally Socialist. In every eapacity he has been the ardent evangelist, living among the people with whom he worked, in lodging houses, riverside hovels, or mining camps. His religion has heen deeply tested. There was a moment when, in despair of a Beneficent Order, he attempted suicide. He has worked superbly in many eauses, and has stuck to none. At forty-seven, in robust health, he has set up a farm, which is also a Socialist settlement, and presumably is meditating his next move. This remarkahle story, the variety of which we have merely hinted at, evidently does not lend itself to literary criticism. When we have said that it is written with simplicity, humor, and also with a Celtic sense of the effective, our critieal duty is pretty well absolved. This is not a hook, hut a man, and a man in his prime. The reeord is not elosed, and formal judgment would be futile. Of the apostolic zeal of Mr. Irvine there is no doubt. Working in or out of eeclesiastical harness, he has heen all things to all men. Such evangelism is a thing apart from pulpit oratory, organized revivalism, and the like. It takes us hack to elementary and apostolie eonditions. We think of a St. Francis, a St. Bernardino, a Whitfield. Such work is the very knight errantry of faith. It is, perhaps, a fair question to ask why this valiant and eontinued effort has had no greater effeet in organization. Mr. Irvine would possibly reply that his task has been preeisely to give leads which others may or may not follow up. There seems to us, however, an irreducible individualism about the man, on his own showing, whieh is the hasis of his power and his weakness. Apparently, the prophetie quality in him easily obseures his good sense. The church trustees who voted to leave eternal punishment in the ereed, "beeause it had never done them any harm," certainly lacked a sense of humor, but were not wholly eontemptible as interpreters of average public opinion. An incorrigible intelleetual restlessness seems to take Mr. Irvine out of the traditional communion of saints. On the way to Socialism he dabbles with "new thought." He seems unlikely to work out in any routine way, the peaceahle fruits of righteousness. For so militant an individualist, Socialism seems likely to he not a eulmination but a stage. Meanwhile this record of a life lavishly shared with others is of great interest. It will make for social compassion, and will afford poignant individual instances of sufferings which we are apt to gloze with disereet generalities.

"Christian Reunion: A Plea for the Restoration of 'the Ecclesia of God'" (Hodder & Stoughton), hy Frank Spenee, a man of husiness, not a theologian, is a curious attempt to set forth in detail the constitution and laws of a united church to he eonstructed on the principles of democraey instead of the episeopaey or the sacraments. The author even goes so far as to print an elahorate set of hy-laws for the government of his church, dealing with the most trivial details of organization and activity. His programme has one great advantage over most proposals for ehureh unity, that it stands not for the reunion of the church at large, but only for a working unity or federation of the local bodies of Christians in eaeh particular community. This is a more feasible task and one much better worth while, quite apart from the elaborate Scriptural hasis which the author feels it ineumhent upon him to eite in its support.

Northumberland is unknown eountry to the average tourist, exeept so far as he eateches tantalizing glimpses of it from the Edinhurgh express. Yet there is no eounty of England so rich in historie assoeiations and scenie variety. Here are the Cheviots, Bamhurgh Castle, Flodden Field, Otterhurn, and Preston Pans. Here was the last retreat of British chivalry, the home of great-hearted rehels from Hotspur to ohscure followers of Prince Charlie. To see the North Country aright one should he young, afoot, and carry a "Marmion" and a hallad hook in one's knapsaek. A fair substitute for this, fireside travellers will find in A. G. Bradley's "The Romance of Northumherland" (A. C. McClurg & Co.). It is spiritedly done, well laeed with poetry and balladry, and in sixteen eolor illustrations after Frank Southgate's sketehes eontains an harmonious graphic eommentary.

Seholars, hearing in mind a past experienee, will not be disposed to aeeept without question Professor Hilprecht's asserion that he has found the "oldest" version of the Babylonian deluge story. The new tablet—a mere fragment of twelve broken lines—is not dated. Granted that it belongs, as claimed, to the Hammurabi period, there is not the slightest reason for helieving that it is older than the tablet found by Scheil, at Sippar, and now in the Morgan library in New York. That specimen is dated in a way which proves that it belongs to the Hammurabi period, and it ean be assigned to the year *e.* 1825 B. C., or, aeeording to another ehronological system for the Hammurabi period, to *e.* 1973 B. C. Unless, however, on closer examination the

new fragment shows the definite ear-marks of tablets of the Hammurahi period, its date may have to be brought down as much as 500 years. Such things happen in Assyriology. A number of years ago an inscription was published and confidently dated at c. 4,000 B. C., only to be shown that it was nearer to c. 2500 B. C.—a trifling difference of fifteen hundred years. Professor Hilprecht's translation of the fragment consists chiefly of bracketed portions, which represent his restorations. If we remove the bracketed portions, there remain less than twenty words, and these add nothing to what was previously known to scholars from the fragments in Ashurbanapal's library. Nor do they throw any further light on the Biblical story.

Morris Hicky Morgan, professor of classical philology at Harvard since 1899, died on March 16, at the age of fifty-one. He graduated at Harvard in 1881, became a tutor there in 1888, and was made assistant professor of Latin and Greek in 1891. His publications include: "De Ignis Eliciendi Modis Apud Antiquos," "Dictionary to Xenophon's Anabasis," translation of Xenophon's "The Art of Horsemanship," "Bibliography of Persius," "The Phormio of Terence," "Eight Orations of Lysias," "The Minor Works of Tacitus," and "The Language of Vitruvius."

Orville James Victor died recently at his home in Hohokus, N. J., at the age of eighty-two. He was born at Sandusky, O., was editor of the *Cosmopolitan Art Journal*, in New York, from 1856 to 1861, and of various other journals and reference publications, and had published "History of the Southern Rebellion," in four volumes; "Incidents and Anecdotes of the War," "History of American Conspiracies," and biographies of John Paul Jones, Israel Putnam, Anthony Wayne, Ethan Allen, Winfield Scott, and Garibaldi.

Jeanne-Marie-Françoise Marnière, the French novelist, who wrote under the pseudonym. J. Marni, died recently at her villa near Cannes, at the age of fifty-five. She was for a time an actress. Her publications include "La femme de Silva," "Amour coupable," and "Le Livre d'une amoureuse"; and she also wrote—alone or in collaboration—several comedies.

Science.

A Book of Precious Stones. By Julius Wodiska. New York: G. P. Putnam's Sons. $2.50 net.

Julius Wodiska is a practical jeweller, and his work appeals to all who have to do with precious stones. The main facts regarding the principal precious and semi-precious stones, as well as the pearl and the coral, are briefly presented in a way that renders them plain to the untechnical reader. In addition, there is given a full and satisfactory description of the processes employed to secure diamonds from the South African mines. An interesting feature of the book is the use and explanation of a number of terms, not generally familiar, which are in common use in the jewelry business to describe the different classes, qualities, and colors of precious stones. There is also an excellent account of the growth of the trade union among the diamond cutters, and of the establishment, in 1903, of the Universal Diamond Workers' Alliance, an organization now having a membership of fifteen thousand, representing the diamond workers of Holland, Belgium, France, Switzerland, England, and the United States. A chapter is devoted to jewelry in the arts and crafts movement, and there is a brief glossary of technical terms, as well as a bibliography of works on precious stones.

The historical portion of the work is less satisfactory than the descriptive; it is brief and contains several errors. For instance, on page 56, the Excelsior and Jubilee diamonds are described as one stone. The diamond known as the Excelsior weighed 971 carats, and was taken from Jagersfontein in 1893, as described in the text; two years later, the crystal from which the Jubilee diamond was cut was found in the same locality, the rough stone weighing 640 carats, and the cut diamond 239. The Excelsior crystal, however, was divided, in 1904, into ten diamonds weighing from 13½ to 68 carats. On page 75, the Pelegrina pearl is confused with the Zosima pearl; the former belonged to Philip II of Spain and weighed 134 grains, while the latter weighed 111½ grains. It is not known in whose hands the Zosima pearl is at present, but the Pelegrina is said to be in St. Petersburg, in the possession of the Princess Youssoupoff. The statement, on page 73, that "the first jewel mentioned in the most ancient decipherable and translatable writing extant is the pearl," is contradicted by the fact that neither in the Egyptian hieroglyphics nor in the Babylonian cuneiform has the name of the pearl been deciphered with any degree of certainty, although the names of several stones appear. The amethyst "Signet ring of Cleopatra" (p. 96), according to the lines in the Greek Anthology, bore the figure of Methe, the genius of intoxication, not that of Mithra. The derivation of the name nephrite is correctly given on page 144, but this name is comparatively modern, and there is no evidence that the ancient Greeks laid especial stress upon the curative powers of the stone in kidney diseases. This belief also finds expression in the name jade, derived from the Spanish *piedra de hijada*, "stone of the flank," and appears to have been first proclaimed, it is stated, by Monardes, 1565, who brought jade from the New World to Spain. The mention of the Septuagint of Revelation, on page 231, is probably a slip of the pen, for "Greek text," as the Septuagint only covers the books of the Old Testament. Of the diamond said to have been engraved, in 1500, by Ambrosio Foppa, called Caradosso, for Pope Julius II, we are informed by Garzoni ("Piazza Universale," p. 550) that it bore the figure of a Father of the Church, not a friar (p. 240).

The illustrations are, in the main, well selected, and add to the attractiveness of the book, but the frontispiece figures a specimen of cinnabar, which is not a gem stone.

Prof. C. Philippi of the chair of geology at Jena University, who was geologist of the Gauss Antarctic Expedition in 1901-'03, died recently in Egypt.

The Rev. Carr Waller Pritchett died in Kansas City, Mo., last Friday, at the age of eighty-six. He was one of the founders of Central College, at Fayette, Mo., and was its president on two occasions; organized Pritchett College, at Glasgow, Mo., in 1866, and was its president for seven years, and for several years was in charge of the Morrison Astronomical Observatory of that institution. He was elected a fellow of the Royal Astronomical Society for discoveries concerning the planet Jupiter.

The Rev. Hugh J. Carney, formerly professor of economics at Manhattan College and an eminent mathematician, died last Sunday of blood poisoning at St. Vincent's Hospital, in New York, after an illness of several years. He joined the Christian Brotherhood at Montreal in 1855, as Brother James. He was in Rock Hill College, Baltimore, when the civil war began, and from there was transferred to Manhattan College under Brother Paulian, and then went to Waterford, Ireland, where he held the chair of mathematics for six years, at the Normal College in that city. On his return to America in 1896, he was appointed professor of economics at Manhattan College, which post he retained until ill-health forced him to retire.

Drama.

The recent production of Marlowe's "Dr. Faustus," in the Garden Theatre, by the Ben Greet players, was a dramatic incident of more than common interest. This was the first serious attempt ever made to act the piece in this country, although it has been the subject of occasional amateur experiment. The Elizabethan Society of London gave a performance of it, with some success, in 1896, but, with this exception it has been virtually an unknown work to playgoers of this or the preceding generation on either side of the Atlantic. For modern theatrical purposes it is obviously unfit on account of its invertebrate, episodic character, its total lack of feminine interest, its exceedingly primitive humor, and the clumsiness of its supernatural which is founded on the grossest mediæval superstition. In many passages, such, for instance, as those introducing the seven deadly sins and the minor imps, the play descends to the intellectual level of some of the dullest of the old moralities. It is only in the intercourse of Faustus with Mephistopheles, in the soliloquies

of the former, in his magnificent apostrophe to Helen, and in the frantic supplications of his closing hour, that the true imaginative power of the poet and his mastery of the "mighty line" are revealed. But as a specimen of early Elizabethan drama the production was highly curious and valuable, and there is no reason to doubt that the performance was characteristic of the period. If the scenic accessories were not precisely Elizabethan in design or effect they were as nearly Elizabethan as it was possible, under the circumstances, to make them. The spirit, at least, was right. The manifest artlessness of some of the players helped to maintain the illusion of a veritably antique representation. The crude vigor with which they attacked the comic scenes was entirely appropriate. The conventional attitudes of the good and evil angels were happily conceived, as was the device of making them chant their messages. As is almost always the case in Mr. Greet's representations the blank verse was spoken with sonority and clearness, with some respect for both sense and rhythm. The parts of Faustus and Mephistopheles were played with comprehension if not with brilliancy. Mr. Greet exhibited discretion in the necessary pruning of the text, especially in his excision of the Roman scenes.

Prof. H. A. Rennert's study of "The Spanish Stage in the Time of Lope de Vega" (New York: Hispanic Society of America) is a work of solid and interesting research. Professor Rennert has naturally followed the Spanish antiquarians and archivists who have brought to light within recent years so much information bearing on the stage of Spain, in its first crude beginnings and through the period of its great flowering and subsequent decay; but he has also added not a little of his own, and has put into instructive comparison much knowledge of the contemporary theatre in France and in England. The result is a work packed with curious and verified details relating to every aspect of the subject. We have an account of the earliest *corrales* in Madrid and in Seville, where the representations of *comedias* and *autos* and *loas* began; together with statistics showing the attendance, the price of admission, the salaries paid to actors, and the royalties given to playwrights, as well as a great deal of matter concerning the actual production of plays—the costumes, the scenery, the theatrical devices, etc. All told, Professor Rennert has given us a real storehouse of information about the Spanish stage, from the fifteenth century to the middle of the seventeenth, to which the *aficionado* may be sent with confidence. The book leaves something to be desired in its printing of Spanish, but is a comely and most readable volume.

"Allison's Lad" is the first of half a dozen one-act plays, in prose and blank verse, by Beulah Marie Dix, and gives the title to the volume containing them (Holt & Co.). They are all episodes of war, dated at different times, and located in England, Ireland, France, and Germany. All of them have a certain theatrical value and are well adapted for stage representation, but they are sensational in character, conventional both in design and personification, and too dependent upon convenient coincidence to have much real dramatic value. Nevertheless they are vigorously written, show a lively appreciation of effective incident and situation, possess atmosphere, and do not actually transgress the limits of possibility. The reason for the adoption of blank verse in some of the plays is not obvious, as the measured lines, although they run smoothly enough, do not reveal any notable poetic faculty, whereas the author's prose is often robust and significant. Perhaps the best pieces are "The Hundredth Trick," of which the scene is laid in Ireland in the days of Queen Elizabeth, and "The Captain of the Gate," supposed to occur in the same country in the time of Cromwell. Both of these are quick in action and vivid in color, while the latter has an ingenious dash of the supernatural. But the whole series may be commended to the attention of any manager in need of a good curtain-raiser. Miss Dix, it will be remembered, was one of the joint authors of "The Road to Yesterday."

Music.

Franz Liszt. Von Julius Kapp. Berlin: Schuster & Loeffler.

Twenty-seven pages of this volume are taken up with a list of the books and articles written on the life and works of Liszt, yet the author is right in saying that all of these are mere material for a real biography of the man who was not only the greatest pianist of all time but who, as a composer, exerted an influence on the second half of the nineteenth century almost equal to that of Wagner. Lina Ramann's three volumes are invaluable, so far as they go; Liszt himself supplied considerable material for them; but they carry the story of his life only to the year 1847, after which there is little beside elaborate analyses of his works. Herr Kapp pursues the opposite course. While introducing separate short chapters on the pianoforte pieces, the orchestral works, the songs, the literary essays, and the ecclesiastic compositions, he devotes most of his space to telling the story of Liszt's life; he does it with commendable frankness, and without the least attempt to gloss over faults of character. He is also much more judicious in his estimate of the works, justly holding that such indiscriminate praise as Ramann and others have bestowed does more harm than good. Liszt needs no partisan clamor. His works have stood the test of time. Kapp even endorses the assertion of the Princess Wittgenstein that he "shot his arrow farther into the future than Wagner."

It cannot be said that Herr Kapp has adduced any important new facts relating to the boyhood and youth of Liszt, or to his meteoric career as a pianist, to which he himself put a sudden stop nearly forty years before the end of his life. But on his relations with the Countess d'Agoult and the Princess Wittgenstein, he throws many new side lights. All previous biographers accepted the legend that the Countess (Liszt's companion for several years and the mother of Cosima Wagner), on hearing that he desired her to change her religion in order that he might marry her, exclaimed: "La comtesse d'Agoult ne sera jamais Madame Liszt." But Kapp cites Liszt's comments on this: "There could not be a more idiotic invention than the story that I offered to marry Mme. d'Agoult, that she proudly refused, and that I wanted her to become a Protestant." The Lola Montez and Janina episodes are frankly discussed, and on page 469 the author indulges in plain talk on Liszt's multitudinous love affairs. He doubts whether he ever was really in love with any woman, and comments on his predilection for princesses and countesses.

As regards the Princess Wittgenstein, who played so important a part in Liszt's life, Kapp denies that it was she who was responsible for his becoming a composer. It was largely owing to her, however, that he gave up his concert tours at so early a stage in his career, thus securing time to compose. In the D'Agoult years he could not have done this, as she had a mania for squandering, her expenditures amounting to some 300,000 francs a year. The Princess, on the other hand, did the world but a poor service when she made additions of her own to Liszt's literary essays and books. In the volume on Chopin her knowledge of life in Poland proved an advantage, but in all other cases her interpolations, which are not marked as such, are verbose and dull. She had the audacity to add, without consulting him, fifty pages of her own to his volume on the Gypsies in Hungary; and these pages included comments on the Jewish question which made no end of trouble for him. The Princess's mania for writing was as remarkable as that of the Countess for squandering money. In the last years of her life she had a press of her own in Rome to print her books; among these was a treatise entitled "Causes intérieures de la faiblesse extérieure de l'Eglise," in twenty-four volumes!

Julius Kapp is the author of a book the subject of which is the friendship between Liszt and Wagner. In the present volume, also, this friendship plays a great rôle. There were breaks in it, one of which occurred when Wagner married Liszt's daughter, Cosima, the first wife of Hans von Bülow, who subsequently (and perhaps consequently) deserted the Wagner camp and became a Brahmsite. Another break was caused by the Princess, who insisted on sharing all of Liszt's letters and secrets. Wagner, to whom his friend was a sort of confessor, resented this, and the correspondence came to an end. The Princess liked "Lohengrin," but for the later

and greater music dramas of Wagner she lacked all appreciation; and she quite lost patience with Liszt because of his zeal for Bayreuth. Kapp gives (pp. 414-16) the best account so far published of what led to Liszt's becoming an abbé. The Princess hoped he would advance gradually till he reached the rank of cardinal, but his own ambition did not lie in that direction. It was owing to her that he devoted much time to writing ecclesiastic music with a view to reforming the Catholic church service; but he soon found that Rome was not ready for a musical reformation. Pope Pius IX was ready to listen to his plans, but the cardinals were opposed, the public indifferent or hostile, and Liszt returned to Germany while the Princess remained in Rome.

Of Liszt's activity as a teacher at Weimar, Kapp gives a less vivid picture than others have done, notably Amy Fay, but the causes which led him to give up the conductorship of the opera in that city—where new composers were always sure of a welcome—are lucidly set forth. Liszt's life was more troubled than the world at large suspects. That it was on the whole a tragedy one feels more strongly than ever after reading this volume. The frank details given regarding his faults at the same time detract little from the impression as to the essential nobility of his character.

Six American singers—Louise Homer, Lillia Snelling, Riccardo Martin, Clarence Whitehill, Glenn Hall, and Herbert Witherspoon—took part in the performance of Converse's "Pipe of Desire" last Friday. It was the first opera by an American composer produced at the Metropolitan Opera House during the twenty-seven years of its existence, and it was sung in English. It may be said at once, however, that this did not prove to be an advantage. Distinct enunciation is a virtue of few opera singers, and it was only now and then that a few words of the text were intelligible, owing also, in part, to the vast auditorium, in which it is difficult to follow even spoken dialogue. Those who had hoped that this occasion would prove the desirability of having all operas sung in English were, therefore, grievously disappointed. It is safe to predict that for the next decade or two all operas will continue to be sung in this city in Italian, German, and French, unless an American composer appears whose song and declamation are as inseparably associated with the English idiom as Wagner's are with the German.

It cannot be said that this is the case in Professor Converse's opera. His attempts to write music to the words before him are on the whole infelicitous and often distinctly awkward. Nor did he manifest true operatic instinct in choosing for his text a poem by George Edward Barton, which, by reason of its symbolism and lack of action, is better suited to the reading room than the stage. A young man named Iolan, who is on his way to claim his bride, Naoia, comes across a bevy of elves, gnomes, and other fairy folk in the forest; their king has a pipe, by blowing which he can make his own subjects as well as Iolan dance. But when Iolan blows into it, heedless of warning, he brings a vision of his betrothed and then the girl herself to his side. His pipe of desire had compelled her, though ill, to arise, to ford icy streams, and, when she arrives, she dies in his arms.

On this slender thread Professor Converse has strung music lasting an hour and ten minutes. The choral parts of this music, accompanying the antics of the elves, are interesting, though not specially elfish. Better still is the orchestral score, which throughout is well constructed and appropriately colored. The composer had evidently imbued himself thoroughly with the spirit of Wagner, whose music dramas are frequently suggested. He uses four or five reminiscent motives, but they are not sufficiently individual to arrest the attention at once. The performance, under the zealous direction of Alfred Hertz, was excellent in almost every detail (apart from the diction), and it seemed as if the management, which has been distinctly hostile to American singers for the last two years, tried to atone for this by doing all that lay in its power, scenically and otherwise, to launch this first American opera successfully.

Debussy has completed a new orchestral work, entitled "Images." It is a suite in three parts, "Gigue triste," "Iberia," and "Rondes de Printemps." The second part was played detached from the others, at a recent Colonne concert under Pierné. It begins with a lively Spanish dance movement, and the colors throughout are laid on more thickly than in his other works. There are bells and muted horns, vigorous march movement and attempts at real melody.

Giovanni Lamperti, the singing teacher (a son of Francesco Lamperti, who died in 1892), died in Berlin last Friday at the age of seventy. He had taught in Milan, Paris, and Dresden, and was the instructor of Mme. Sembrich.

Prof. Karl Reinecke, the well-known German composer and conductor, died recently at Munich, at the age of eighty-five. He conducted the famous Gewandthaus concerts in Leipzig from 1860 to 1895, and had taught in the conservatory there. He was especially noted as an interpreter of Mozart. His more famous pupils have included Sullivan, Max Bruch, Grieg, and Weingartner.

Art.

THE HOENTSCHEL COLLECTION.

On March 14 was opened what is modestly designated as Wing F, at the Metropolitan Museum. It is really a small but completely representative museum of the decorative art of Europe, and the British-American colonies from the beginning of the Middle Ages to the early years of the century just past. The growth and installation of this collection are so remarkable as to require a brief explanation. In 1906, J. P. Morgan bought the famous Hoentschel collection, and planned to make it available for American designers. The eighteenth century portion, on the whole the finest, he gave to the Metropolitan Museum, offering to place the earlier portion on indefinite loan. The museum wisely determined to use this as the nucleus of a department of the decorative art of Europe, asked the late C. F. McKim to build a suitable extension for such use, and appointed Dr. Valentiner, then Dr. Bode's secretary at Berlin, to serve as curator of decorative art. It was the single instance in the history of the museum in which the galleries were built expressly for the collections to be contained in them, and the requisite science and taste were provided in advance to insure the symmetrical growth and installation of a great collection. The result is so eminently successful that the precedent will not remain a solitary one. Meanwhile the collection was growing through other gifts and loans by the donor, including such remarkable objects as the Mazarin tapestry and the late Gothic tombs from Château Biron. Only a few months ago Mrs. Russell Sage gave the Bolles collection of colonial furniture and antiquities, thus providing a valuable annex to the main European display.

The keeping of wood carving and fixtures from abroad requires peculiar precautions. Our dry summer heat and frequent changes of temperature tend to warp and rack such objects disastrously. Accordingly the Hoentschel wing is cut off by swinging doors from the Museum generally, and is furnished with a climate of its own combining equability with considerable humidity. This ventilating system was contrived by the late Alfred R. Wolff, the Museum's engineer, and in the seven months since last August, the galleries have not varied more than a point or two from 64 Fahrenheit and 65 per cent. of humidity. If this system meets its apparent promise, it will be widely imitated.

The following account of the new galleries draws heavily upon the special *Bulletin*, which the Museum has issued to mark the opening. The large central hall is chiefly devoted to European sculpture of the Renaissance and earlier. A fine marble ciborium of Roman type and twelfth-century date is the most prominent object. It is flanked by late Gothic choir stalls, with figure decoration. Near-by, at the entrance, are Renaissance stalls of carved wood. Cases of the most brilliant Italian Majolica, loaned by Everit V. Macy, repeat on the floor and more emphatically the colors of Renaissance tapestries which adorn the upper walls. Virtually all the sculpture of this period and earlier was intended for a frontal view, so, nation by nation, the statues are set against massive screens or against the walls. The collection is young, but it already includes nameless fine specimens of the Romanesque and Gothic periods, besides impor-

tant examples of Andrea and Giovanni della Robbia, the masters of polychrome glazes, Verrocchio, and Antonio Rossellino. We wish we could say as confidently Agostino di Duccio, who appears on the list in a very dubious marble relief. More representative is naturally the collection of plaquettes and other small bronzes which show the development of Italian sculpture from Donatello to Giovanni da Bologna. Donatello is not represented, but we are very near the style of the great reforms in some of the plaquettes, and in a bronze Hercules attributed to his successor Bertoldo.

The smaller galleries that surround the great hall in two ranges are treated quite simply and as mere receptacles for the exhibits. Here the architect has effaced himself. Each hall is hung in tints that recall the period and set off the collections. It was a fine tact that isolated the most important sculptures, the Biron tombs, to a small chapel-like hall, where one sees them in dim light and realizes their solemnity. The largest Gothic hall is hung in dark blue, which, while displaying the exhibited objects, also fuses them as Gothic architecture and decoration always loved to unify its complicated ingredients. The Renaissance room, on the contrary, is in a bright buff. This art loved definition—a few objects keenly projected from a background. In the seven galleries, devoted to the art of France from Louis XIV to the Revolution, the exhibits themselves almost cover the walls. Complete doorways, chimney pieces, panels, large cabinets, furniture of all degrees, meet the visitor's eye. And the workmanship is of the best. Here is a suite of panels carved by the great Salembier. Chiselled metal ornaments, either still in place or detached, by Boulle, Gamcri, Gouthière, Riesener, represent the glorious culmination of historic ornament before its swift decline.

In a general way the pride of the collection is the tapestries, which run from the late Gothic period to the end of the eighteenth century. Mr. Morgan's tapestry, Christ as Judge, which was owned by Mazarin, is world-famous. As a combination of fine design—Matsys's influence is apparent in it—and harmony of bright colors and gold, it is unique. Of an equal gorgeousness, but somewhat later date, are the two Brussels tapestries made by Pannemaker and loaned by George Blumenthal. The largest Gothic room contains two magnificent gates in gilded wrought iron of the thirteenth century. The bold scrolls terminate in grotesque dragons' heads. We hardly know where a parallel for this work could be found. It is an epitome of vigorous Gothic design. In the same room are admirable tapestries, stained glass, and sculptures of a peculiar spirituality in stone and wood. Many will find this the most attractive of the galleries.

From the administrative point of view, the establishment of a museum within a museum raises certain delicate considerations. What is decorative art? What is fine art? Everything of a very beautiful sort is likely to be both. We have in the New Wing a classification which at one point or another crosses or repeats that of every other department dealing with European art. For example, the picture gallery possesses five painted fronts of Florentine bride chests. Surely, these are decorative art, but the galleries will hardly give them up. At many points competition between departments may arise because of the ambiguity of the word decorative. At Berlin, for instance, Dr. Bode is prone to claim for the Museum of Fine Arts a whole class of beautiful objects which are desired by the Museum of Decorative Art. On the other hand, such competition may have a generally stimulating effect, and the evil to the public is slight when, after all, the disputable objects are kept under a single roof. Students lose time through such cross-classifications, but this is probably outweighed by the public advantage. In such a department as the Hoentschel wing one may breathe with delight the air of past ages, enjoy in harmonious surroundings their choicest products, compare at leisure, nation by nation, one artistic achievement with another. M.

THE NATIONAL ACADEMY.

As one enters the Fine Arts building, Mr. Waugh's Buccaneers shouts a welcome from the remote depths of the Vanderbilt Gallery. It looks less good on nearer approach, though it is a swaggering thing. The gory villains, grinning horribly the while, swarm over the rail. They have a winning look in their savage eyes, but are singularly frozen in their murderous attitudes. Don't fear them; these be studio pirates, and will do no harm. Between this desperate strife and a ship flying a large "Jolly Roger" heave several of Mr. Waugh's sleekly powerful waves. Our bow is made to the picture of the show and to the winner of the Thomas B. Clarke prize.

There are two ways of painting an acceptable picture. One is to have a distinctive and personal vision. This is very difficult and not to be got by taking thought. The other is to ally yourself with a sound tradition. Where the sound tradition exists, originality is most likely to thrive. So one must welcome and approve such learned and competent landscapes on the bright modern scale as Redfield's, Scofield's, Bruce Crane's, Gardner Symons's—to mention only salient figures in the exhibition. Ernest Lawson brings unusual energy to the ruling conception of landscape. More interesting, if frequently less able, are certain exhibitors whose method is less forthright and dynamic. It is instructive, for example, to see how A Breezy Day, by Worthington Whittredge, former president of the Academy and recently deceased, holds its own with far cleverer things. It is just a point of rocks jutting out beyond a sandy road into a ruffled sea. It carries none too well, and is not very luminous; but the eye is singularly at peace in it. One has here not merely a painstaking transcript of an attractive bit of nature, but that more indefinable thing, a sense of place. With slender technical resources, it captures something that eludes more strenuous painters. This mild persistent quality we expect in Ben Foster's painting. A blithe meadow scene with a river is full of his subdued raciness; a yellow sunset with dancing figures reveals him in an oddly fantastic vein, with fuller impastes—something other than the self we have come to value.

Only two pictures were absolutely thrilling to the present writer, and still cause a commotion after twenty-four hours of absence. These were Emil Carlsen's Moonlight Cattegat and George Bellows's Floating Ice. Carlsen's nocturne is woven in a strangely beautiful blue-gray—a texture subtly brightened to mean the edges of clouds moving in upon a lunar interspace lightly veiled by nearer mists, or darkened to fill the hollow backs of slow tidal undulations. The expanse of the strait goes up endlessly under the moon. Everything is spacious and endued with lunar glamour, yet definite and verifiable. It is a very fine achievement—a classic thing for all its modernness. In it is no trace of the impetuosity of the impressionists, nor yet of the mere deft syncopations of many of the Whistler moonlights. By no means reminiscent, to match its large tranquillity one must go back to Claude. George Bellows's view of snow-covered hills beyond a sparkling river is at once the most nervous and restful picture of the show. Here we have just the indispensable indications of a vast scene—the green translucence of the nearer shallows, and the deep blue of the channel where the ice gleams. Beyond, the snow-covered hills heave up. Chosen accents—a quarry gash, a factory chimney, an occasional bare tree—give assurance of solidity and distance. Nothing could be more impetuous than the workmanship or more discreetly controlled. Every touch is quite literally an indication; there is no inert passage. Such work fairly rivals the synthetic miracles of the Far Eastern painters, remaining, however, naturalistic. What makes the picture is not ability of hand—in that Mr. Bellows has many competitors—but extraordinary fineness and intensity of vision.

Portraits, what shall one say of them? Here they are hand-made in quantities, and with a certain ability. Mr. Blumenschien's German Tragedian has character and *naiveté*, but like much of his work, lacks arrangement and looks like an illustration writ large. One of the most haunting things is John da Costa's Petite Marquise, for no very good reason apparently, except that he has really caught the character of an awkward little girl uneasily got up in Trianon costume. Otherwise, it is rather hard, but one doesn't forget it. Mr. Tanner's portrait of himself makes no pretensions to *maîtrise*, and is full of blood; quite one of the refreshing things in its class. Robert Henri's most engaging head of a baby girl has been relegated to the outer glare of the Academy room. Ellen Emmet's two full-length portraits are well made and placed, particularly that of two gently-bred boys who have all the wistful charm of adolescence. That very uneven and experimental painter, Alden Weir, has rarely done anything more completely captivating than The Pet Bird. A girl looks lovingly at the paroquet which, perched on her left hand, is a vivid note of green in a surface of striated gray and rose. The picture has the essential qualities of solidity and envelopment, and a very special grace to boot.

Sculpture plays its usual modest incidental rôle. Courtenay Pollock's portrait heads are vivacious. Robert Aitken's have at once a subtler and severer accent, and are the most satisfactory of the exhibits. Chester Beach and J. Scott Hartley are well represented. The most ambitious contribution in sculpture is Gertrude V. Whitney's marble group, Paganism Immortal. It is delicately modelled after the fashion that Rodin has taught, and the nude pagans evidently yearn for each other—again a Rodinesque proclivity. The pose is *guindé* and the mood tragic. It is a creditable performance, but the artist apparently entertains severely orthodox ideas concerning what the hymn calls the "heathen in their darkness."

The National Academy as an exhibiting body is much in the position of the proverbial man who, falling from a scaffold, and being asked how he was, replied, "Very well, so long as this lasts." Now the Academy exhibitions cannot last on the present basis. This is the eighty-fifth; the hundredth will hardly be reached unless a miracle be performed meanwhile. An exhibition of art must serve either the purposes of pleasurable display or those of a mart. This does neither. It attracts few visitors and fewer buyers. In the life of the city it is an episode without importance. Yet pilgrims and even patrons frequent the show of the Pennsylvania Academy, which is made up in large part of the work of New York artists. The difficulty, as has been said some thousand times, is the lack of proper exhibition galleries. If shows are to be given by the artist societies, the display must be of a scale and impressiveness to attract the public. As things are to-day few people will visit the crowded galleries in Fifty-seventh Street, except from a sublime sense of duty. Not that the show itself is worse than the run, but simply that it is no money's worth, in the sense that a Royal Academy or a Salon is. If one is patriotic enough to affect the painting of his own land, he can see it much more fully and agreeably at the dealers' or at Philadelphia, including many painters of talent who from choice or necessity do not darken the Academy doors. The Academy waits in the hope of a Maecenas. May he be provided, and promptly. Unless the Academy gets its change of air soon even *aurum potabile* will have been administered too late. M.

Franz Hals's Family Group, which includes portraits of the painter, his second wife, Lysbeth Reniers, his son and daughter, his negro servant, and a pet dog, has recently become the property of Otto H. Kahn, of New York, and is now on exhibition at the Metropolitan Museum of Art. The figures appear on a landscape background (one of the few that Hals ever painted), with a glimpse of the old Dutch city of Haarlem in one corner. William Bristow of London was the first recorded owner of the canvas (which is 79 by 112 inches); it was acquired in about the year 1759 by his nephew, John Ward, in whose family it had remained until it was sold last summer by Colonel Warde (who had added the "e" to the family name) of Westerham, Kent, to Duveen Brothers, the English art dealers, from whom it was bought by Mr. Kahn.

Fuller details have been received with regard to Professor Garstang's recent discoveries at Meroe, in Egypt, mentioned in the *Nation* of February 17. They include a high altar of the great Temple of Ammon, with two terra-cotta tables of offering lying on the ground before it, where they must have been placed just before the destruction of the city. An inscribed tablet, containing prayers for protection from injury, was found near by. The altar, four feet high and four feet broad, is of black stone, and the sides are sculptured with reliefs of Horus and Thoth Anubis, the Nile deities, the Queen and King. The King is kneeling, with the High Priest standing in front of him, offering an oblation. The altar could be seen on entering the eastern pylon. A secret chamber was discovered a hundred yards distant behind the sanctuary, in which probably the oracle was worked.

Edmond-Charles Yon, a French landscape painter, died recently at Versailles, at the age of forty-eight. He had been a regular exhibitor at the Salon, and one of his pictures, Le Pont Valentré, à Cahors, is in the Luxembourg.

Denis-Pierre Bergeret, the French painter, who had exhibited pictures of flowers, fruit, and still life at the Salon since 1870, died recently at the age of sixty-six.

Finance.

AN "IMPORT EXCESS."

Figures of foreign trade are such dry statistics that the ordinary reader is apt to turn with dismay from an exposition of them. Dickens, with his inimitable art of extracting humor from a social bore, has pictured that delightful conversation between Mr. Baps the dancing master and Sir Barnet Skettles, at Dr. Blimber's party, as to "what you were to do with your raw materials when they came into your ports in return for your drain of gold." The innocent Mr. Toots had already suggested, "Cook 'em" —which Mr. Baps thought would not do:

> Sir Barnet Skettles had much to say upon the question, and said it; but it did not appear to solve the question, for Mr. Baps retorted, Yes, but supposing Russia stepped in with her tallows—which struck Sir Barnet almost dumb, for he could only shake his head after that, and say, Why, then you must fall back on your cottons, he supposed.

The hit at the ordinary colloquy on trade, and at the genial outside public's attitude towards such colloquies, is palpable. Occasionally, however, there occurs an incident, or a general movement, in the foreign trade of a great nation, of so dramatic a character that the matter at once becomes a topic of vigorous discussion, even by the plain man in the street. Of such a character, for instance, was the extraordinary rise in what was called our "foreign trade balance," during 1900 and 1901.

The economist, the Bureau of Statistics, and the Stock Exchange had long been discussing the increase in a single year, in the country's export trade, to $200,000,000 more than the previous annual maximum, and the rise in the 1900 excess of exports over imports to $648,000,000, where $300,000,000 had been the greatest export excess in our history, up to three years before. The outside public began to join in the discussion when Wall Street echoed with the story of our enormous credit balance on the foreign money markets, and when an Austrian statesman, in a public speech, urged industrial Europe to "stand shoulder to shoulder to resist the American invasion."

In many respects, what the monthly trade statements are reporting now is the reverse picture to that of 1901. Last week's report on February's foreign trade not only shows no portentous heaping up of foreign credits, through rising excess of merchandise exports over imports, but the export excess for the eight months ending in February is actually the smallest by nearly one hundred millions of any corresponding period since 1896, and February itself shows an excess of merchandise imports over exports, the first that has occurred in that month since 1895.

BURLINGAME PUBLIC LIB.

In other words, so far as regards our "foreign trade balance," we are back where we were before the great industrial revival. Europe no longer talks of the "American invasion"; discussion converges now on the extraordinary American import trade, which in the past eight months was twice as great as in the same months of 1901, whereas exports increased only 20 per cent. Nor are the foreign financial markets debating now the next move which New York is likely to make with its accumulated European credit balance. The most-mooted question of the hour is, how the American market can raise in Europe, through sale or pledge of American securities, credits enough to balance the international account and prevent an outflow of gold.

The man in the street, who does not follow closely the developments in such fields at the less dramatic intervening periods, is likely to ask what has happened. The resultant general situation, as regards our international position, is plain to any one; but it is not plain, any more than it was when the opposite conditions were unfolding on the eve of 1901, what the altered situation really means.

There are several possible answers. It is replied, first, that our enormous import trade is a sign of unprecedented home prosperity and consuming power. If it is asked why exports do not increase proportionately, it is pointed out in some quarters that we are reaching the limit of production in certain great lines of export, and in others that our home consumption has expanded so enormously that even immensely enhanced production, industrial and agricultural, cannot supply the home demand and still leave an old-fashioned surplus for the export market. But there is yet another group of observers who insist that we have forced up prices of commodities so high, in the United States, that foreign markets not only will not buy our goods on the former scale, but find it profitable to sell their own export surplus in America.

The strength of the first of these theories lies in the current reports of unusually large production, traffic, and bank exchanges; its weakness, in the fact that nobody alleges the present prosperity, and the present demand for home consumption, to be equal to such a year as 1906, yet that our import trade since the middle of 1909 has been greater by $220,000,000 than in that year. The weak side of the last of the theories recited is that even the foreign "index numbers" show extraordinarily rapid rise in commodity prices; its strongest argument lies in the fact that the rise in prices, during the past twelve months has notoriously been greater in the United States than anywhere else in the world, and in the equally notorious fact that prices, even of our staple export commodities, are in some important instances higher in America than in Europe. Somewhat to the point is the conclusion, long ago established as a matter of economic history, that our immense "foreign trade balance" of 1901, and the "American invasion," were direct and logical consequences of an era of low prices in this country, when we had learned to make our goods so much cheaper than Europe, and at the same time so much better, that Europe had to take them.

How We Select Our 6% Reclamation Bonds

Our experience with Reclamation bonds covers 16 years. During that time we have bought and sold 78 separate issues of Drainage and Irrigation bonds. All have been secured by first liens on good farm land, and no investor has lost a dollar through default in interest or principal.

We are the largest purchasers of Reclamation bonds, and thousands of bond buyers place confidence in our selections. As a result we are constantly offered the pick of many projects. Thus we are able to select for our customers the cream of these securities.

Our Competent Staff

We employ in our investigations engineers and attorneys of national repute, and of wide experience in reclamation projects. Certified copies of their reports and opinions are supplied to our customers.

The Vice-President of our Company almost constantly travels in sections where land is reclaimed. Thus we keep in close touch with the best undertakings.

We buy no issue of Reclamation bonds until all officers of our Company, and all engineers and attorneys employed in the matter, unanimously agree on the safety of the bonds in question.

The Exact Data

In irrigation projects water supply is now determined by Government records covering a number of years. Government surveys show the area drained by the streams in question. Government records tell the minimum rainfall.

When fertility is in question, soils are easily analyzed. We may know their constituents, and the size and kind of crops they will raise.

Naturally, men don't reclaim land that isn't remarkably fertile. These lands on the average are the most productive farm lands in America. And the question of crop failure is practically eliminated by the control of water supply.

There are few undertakings where the security of a lien can be more exactly determined than in reclamation projects rightly investigated. The Government itself is spending many millions of dollars on such projects, depending solely on the land for repayment.

Farm Lien Security

Reclamation bonds are secured by first liens on good farm land. In irrigation projects the liens are given by land owners in payment for water rights. The bonded indebtedness rarely exceeds one-fourth the land's value. As the liens are paid off in annual instalments the security increases each year.

The bonds are additionally secured by a first mortgage on all the property in which the proceeds of the bonds are invested. Thus we combine corporate responsibility and management with farm lien security.

Some Reclamation bonds are issued by organized districts, so the bonds become tax liens. Some are "Carey Act" bonds, where the State supervises the project.

All are serial bonds, so the indebtedness is rapidly reduced. One may get these bonds maturing all the way from one to twenty years. The denominations are $100, $500, and $1,000. The interest rate is six per cent.

These bonds have become the most popular bonds that we handle. In our estimation it is hard to conceive of any more inviting security.

Ask for Information

Reclamation bonds combine safety with fair interest rate. They appeal to all investors, small and large. Please ask us to send you a new book of facts which we now have in preparation. Cut out this coupon lest you forget.

Algernon Blackwood's

THE EDUCATION OF UNCLE PAUL

By the author of "John Silence." $1.50.

A seemingly crusty bachelor is led by his nieces and nephews into the world of child fancy.

This novel is mentioned among the first dozen in all surveys of current English fiction. The *Spectator* says of it, "Marked by a sense of beauty and a wealth of poetic invention. There is humor. An uncommon book."

Just Issued

R. R. La Monte and H. L. Mencken's

MEN VS. THE MAN

Friendly letters for and against Socialism actually exchanged between Mr. La Monte, editor and Socialist of New York, and Mr. Mencken, editor and Individualist of Baltimore. A timely book of wide appeal. $1.35 net.

The Romance of the American Navy

As Embodied in the Stories of Certain of our Public and Private Armed Ships from 1775-1909

By FREDERIC STANHOPE HILL, Late, U. S. Navy. Author of "Twenty-six Historic Ships," "The Lucky Little Enterprise," etc. 8vo. With 44 Full-page Illustrations. $2.50 net.

A vivid presentation of the dramatic events in which our navy has distinguished itself on the high seas, and a stirring account is given of the splendid spirit of adventure and the deep-rooted patriotism that time and again gave the American navy the advantage over the ships of its adversaries.

The Achievements of Luther Trant

An Epoch-Making Detective

By EDWIN BALMER and WILLIAM MacHARG

Illustrated, $1.50

Not only *something* new, but the *very newest*—and last—thing in detective fiction—a detective who is a psychologist and catches criminals, not by the marks of crime on *things*, but by the marks of crime on the *minds of men*. The detective fiction of the past had nothing like it, and it blazes the trail and *sets the pace* for the detective fiction of the future.

The Seventh Noon

Third Edition Nearly Ready

The Book That Has Set the Country Talking

By FREDERICK ORIN BARTLETT

Illustrated, $1.50

The story of *The Seventh Noon*, the scene of which is laid in New York, is a manly man's revolt against his humdrum daily existence, and his determination to know, for one week at least, what it really means to live as he would like to live.

"The reader glues his eyes to the rapidly turned pages and halts not for food or sleeping."—*Chicago Record-Herald.*

The Scar A Novel of the New South

A Very Important Novel

By WARRINGTON DAWSON

$1.50

The most brilliant novel of the South that has yet appeared—"the drama of a country."

"This author writes with power and interest of vital matters," says Mr. Roosevelt in the *Outlook.*

Happy Hawkins

Fourth Edition Selling

By Robert Alexander Wason

Illustrated, $1.50

The buoyant, rollicking story of a great American that sooner or later every American will read.

Trespass

By Mrs. Henry Dudeney

$1.25 net; postage 12 cts.

The accomplished work of a great English novelist. "Masterly," says the *Outlook.*

A Cycle of Sunsets

For Good Cheer

By MABEL LOOMIS TODD

$1.20 net; postage 12 cents

Ready April 9

A unique book, the well-beloved author of which needs no introduction.

It is a sympathetic study of sunsets—an attempt to put into words the splendor and variety of them as observed by a nature-lover. Interwoven are some delightful comments by the way on country life and the daintiest of love-stories about the gay, romantic *Marigold.*

The word-painting is exquisitely done. The style is perfect art. One gets the feeling of listening to the enthusiasm of a woman of refinement and culture as she tries to make you see the resplendent sunsets that have so gladdened her own life.

The book is particularly adapted for Christmas and Easter giving.

Anti-Pragmatism

For Every Thoughtful American

By Professor ALBERT SCHINZ

$1.50 net; postage 12 cents

Now Selling

A remarkable study of American life by an acute observer—a book which, published in French as well as in English, has commanded attention throughout the world of philosophic thought, both in America and in Europe.

"The book will set many readers thinking."—*International Journal of Ethics.*

"It is the most masterly analysis and criticism that modern Pragmatism has yet had."—*American Journal of Psychology.*

"Extraordinarily keen."—*The Nation.*

Self Help and Self Cure

Indispensable

By ELIZABETH WILDER and EDITH MENDALL TAYLOR

75 cents net; postage 10 cents

Ready April 9

In 133 pages the authors have embodied here the latest scientific thought on the subject of Mental Healing. Approaching the subject through the successive steps of Body, Mind and Spirit, they present it so directly, clearly, and simply that he who runs may read.

In the best sense the book may well be called *A Primer of Psychotherapy.*

Woodland Paths

Simply Delightful

By WINTHROP PACKARD *Ready April 9*

Illustrated. $1.20 net; postage 10 cts.

A spring volume of nature essays by the author of the famous "Wild Pastures" which established Mr. Packard as a nature writer last year and caused the *A. L. A. Booklist* to say: "Worthy to stand beside the work of Burroughs."

SOME IMPORTANT SPRING BOOKS JUST PUBLISHED BY CHARLES SCRIBNER'S SONS

The Indian and His Problem

By Francis E. Leupp

Former U. S. Commissioner of Indian Affairs

The writer was for four years Commissioner of Indian Affairs. This fact, taken with his life-long interest in the Indian, marks him as the man of all men fitted to write on this subject. But with this knowledge he combines a quality less common—a talent of easy, vivid, entertaining writing. The book has plenty of action and incident, for the writer points his argument and explanation with illustration and example. It is clear, thorough, and comprehensive. Some of the chapter headings are: "The Indian as He Was," "What Happened to the Indian," "The Problem and a Way Out," "The Indian Service," "The Indian at Work," "Missionaries and Their Methods," "The Indian Territory Experiment," "Theory and Fact in Education"—these and many other topics are treated with thoroughness and lucidity.

Promenades of An Impressionist

By James Huneker

Author of "Egoists," etc.

A volume of brilliant, sparkling criticisms. The delicate and suggestive qualities of Mr. Huneker's style enable him to express ideas of singular subtlety.

The field of the writer's "Promenades" is for the most part a modern field. Mainly he flashes upon the screen such figures as Cézanne, Rops, Monticelli, Rodin, Carrière, Degas, and Sorolla.

If he turns back as far as Greco, Velasquez, and even Botticelli, it is because they are, in a sense modern discoveries. His pages are alive with color and anecdote. $1.50 *net; postpaid,* $1.65

Some Musical Recollections of Fifty Years

By Richard Hoffman

With Memoir by MRS. HOFFMAN

Delightful memories of musicians and musical affairs in this country and England. The account of Mendelssohn's leading of the "Elijah" at Birmingham; of Jenny Lind and her appearance at Castle Garden and her tour of this country under P. T. Barnum; of Thalberg, Von Bulow, Gottschalk, Liszt—these and many other reminiscences of the audiences, musicians, concerts of the country fifty years ago, make up a fascinating book.

Illustrated. $1.50 *net; postpaid,* $1.65

Privilege and Democracy in America

By Frederic C. Howe

Author of "The City: The Hope of Democracy," "The British City: The Beginnings of Democracy," etc.

Its pages live with the vital questions Americans must settle if Democracy shall remain a fact.

Chiefly deals with monopoly and waste, the causes of the Anti-Trust and Conservation Movements.

It gives startling evidence of the strength in which the foe of Democracy is entrenched; it shows how all land accumulates more and more into a few iron hands; how more and more critical becomes the opposition of the "Haves" and "Have-nots"; it shows a crisis impends and suggests a remedy.

$1.50 *net; postpaid,* $1.65

Wonder-Working Providence of Sion's Saviour in New England

By Captain J. F. Johnson

This work is the first published history of New England. Captain Johnson, who came to this country in 1630, wrote it in reply to various defamatory reports in England of the situation in Massachusetts, both in the Church and politics.

He gives a stronger, clearer picture of New England life in those days than any later writer of fact or fiction.

Edited by J. F. Jameson, Chief of the Historical Department, Carnegie Institution, Washington—a descendant of the writer. It forms one volume of

Original Narratives of Early American History

A series that sets forth at first hand the settlement and development of this country.

Other volumes already out: The Northmen, The Spanish Explorers in the Southern United States, Governor John Winthrop's Journal, etc. All edited by highest authorities.

$3.00 *net; postpaid,* $3.30

IMPORTANT NEW PUBLICATIONS OF

D. APPLETON & COMPANY

29-35 West 32nd Street, New York City.

AN ADMIRAL'S LOG

By Rear-Admiral ROBLEY D. EVANS, U.S.N. (retired)

The account of Admiral Evans's sojourn in the Philippines; of his visit to China at the time when the allied armies were encamped before Pekin; of the visit of Prince Henry of Prussia to this country, during which Admiral Evans acted as his personal escort at the special request of the German Emperor; and, at the end, the detailed story of the famous cruise of the Atlantic Fleet from Hampton Roads, with the description of the festivities and welcome accorded it in various ports.

Illustrated. 8vo, decorated cloth cover. $2.00 net.

A special limited edition in fine binding. Each copy signed by Admiral Evans. $5.00 net.

To be complete in eight volumes. Volume VII now ready

A HISTORY OF THE PEOPLE OF THE UNITED STATES

By JOHN BACH McMASTER, Ph.D.

Professor of American History, University of Pennsylvania

This volume brings the history down to 1852, telling of one of the most vital periods in the history of the country. It includes the extraordinary growth of civilization throughout the land, which began just prior to the outbreak of the Civil War, as well as the Ante-Bellum controversies, the beginnings of the West, and the great commercial and shipping development led by New England.

Adequately illustrated. 8vo, cloth, gilt top. Per volume, $2.50 net.

To be Published April 22

THE AMERICAN PUBLIC LIBRARY

By ARTHUR E. BOSTWICK, Ph.D.

Librarian St. Louis Public Library, Late Librarian New York Free Circulating Library and Brooklyn Public Library, etc.; President American Library Association, 1907-08.

For the general reader, for the librarian, who will find in it a grouping of facts and a mode of treatment that may be suggestive and interesting; for the young library assistant, and for the student in library school or training class, who will find in it, not an exhaustive treatise on library economy, but rather a bird's-eye view of the subject.

Illustrated. 12mo, cloth. $1.50 net.

The Southern South *April*

By ALBERT BUSHNELL HART, Ph.D., LL.D., Professor of History at Harvard University. A careful, accurate consideration of the condition of our Southern States four decades after the close of the war between the States, with philosophical conclusions which the author has arrived at as to the outlook for the future in commerce, agriculture, and sociological conditions. 12mo, cloth, $1.50 net.

The American Hope *April*

By WILLIAM MORSE COLE, Assistant Professor of Accounting in Harvard University. An attempt to look beyond the unfavorable symptoms of American life, to show the rational point of view toward American conditions.

8vo, cloth, gilt top, rough-cut edges, $1.50 net.

Descriptive Meteorology *April*

By WILLIS L. MOORE, Chief U. S. Weather Bureau. A book that brings the essentials of meteorology up to date, in an available form. Chapter IX is of especial interest to aviators.

Many maps and illustrations. 8vo, cloth, $3.00 net.

Up the Orinoco and Down the Magdalena *April*

By H. J. MOZANS. In this book the author relates his travels to South American countries and across the Andes under unique and unusual conditions, travelling mostly on foot or with pack mule, and frequenting unknown and little visited places.

Illustrated with 16 half-tones, 8vo, gilt top, rough-cut edges, $3.00 net.

The Reconstruction of the English Church *Late Spring*

By R. G. USHER, Instructor in History, Washington University. This book traces the development and reconstruction of the English Church from the days of Richard Bancroft, whose life it narrates.

8vo, cloth, gilt top, rough-cut edges, 2 vols., $6.00 net.

The Psychology of Reasoning *Late Spring*

By Professor W. B. PILLSBURY, University of Michigan. An effort to determine the ways in which reasoning has grown and to discuss the uses that have been made of the materials in reasoning.

Large 12mo, gilt top, rough-cut edges, $1.50 net.

Music: Its Laws and Evolution

By JULES COMBARIEU, Lecturer at the Collège de France. Translated by Joseph Skellon. Illustrated with many extracts in musical notation from the works of the masters in support of the author's theory that "Music is the art of thinking in sounds." *March.* Crown 8vo, $1.75 net.

The Conquest of Disease through Animal Experimentation *March*

By JAMES P. WARBASSE, M.D., author of "Medical Sociology." The relations of human life to the lower animals from the aspect of biology, with special reference to the intertransmissibility of diseases and the methods of study applied to their prevention and cure. Large 12mo, cloth, $1.00 net.

Important New Spring Books

From Page's List

Kilmeny of the Orchard L. M. Montgomery's *new book*

Illustrated in color by George Gibbs, $1.25

A sweet and charming love story by the author of "the delightful and irresistible ANNE books"—"Anne of Green Gables" and "Anne of Avonlea." Miss Montgomery has *created* for her new book another unusual heroine in Kilmeny Gordon, the beautiful dumb girl, who is sure to rival even "our dear ANNE" in the affections of thousands of readers. *Ready April 15th.*

A Cavalier of Virginia
Theodore Roberts's *new novel*

Illustrated, $1.50

A stirring tale of the old chivalric days of Colonial Virginia told in the author's best vein. The character of the CAVALIER is a most compelling one, and the reader follows his adventures on land and sea with breathless interest.

Ready in April.

My Heart and Stephanie
Reginald Wright Kauffman's *new novel*

Cloth, illustrated, $1.25

A striking detective story dealing with the mystery surrounding the death of the Crown Prince Rudolph of Austria. A goodly tale of love, mystery and adventure.

Just Published.

The Nation.

NEW YORK, THURSDAY, MARCH 31, 1910.

The Week.

Hearty congratulations will go to Mr. Taft from all over the country on his success in bringing about a tariff agreement with Canada. If there is anything a trifle more barbaric than tariffs themselves it is tariff wars. The interests of Canada and the United States are so interwoven that tariff hostility must have done incalculable harm on both sides of the border. In just such negotiations as this Mr. Taft is at his best. His personal charm, his tact, his amiability, his natural bent toward compromise, all stand him in good stead, and in this case serve the country as well. In no field of diplomacy has our record been marred by such gross stupidity as in our negotiations during many decades with Canada.

By the sudden death of Justice David J. Brewer the Supreme Court of the United States loses an able jurist, and the country a sincere patriot and wise councillor. For the twenty years spent as a member of our highest tribunal, Judge Brewer worthily upheld the traditions of that bench upon which his uncle, Stephen J. Field, was also sitting when Judge Brewer took the oath of office. His appointment he had earned by his years of service as Chief Justice of Kansas and as a judge of the Circuit Court of the United States. As a jurist his learning was of the most solid kind, his decisions invariably commanding the respect of the bar. Hard-working, of clear understanding and unflinching courage, Judge Brewer was essentially a democrat and a representative of the best type of American citizenship, of the ever-sound heart of the nation. Thoroughly imbued with the spirit of the founders of our institutions and keenly devoted to the principles upon which our government was based, he never hesitated to stem the current of popular opinion whenever he dissented from it. For a man of this kind and of this ability to disappear from any part of our public life is an occasion for genuine mourning.

Of late years Judge Brewer had more and more appeared in public as a lay preacher of rare power and usefulness. Thus he frequently presided over gatherings of lawyers and jurists because of his desire to dignify and uplift his profession. On his seventieth birthday we pointed out that his "appeals to the bar of the country for nobler ideals, for steadfast opposition to the demoralizing commercial tendencies of the present day, and for a higher code of professional ethics will be as gratefully remembered as his clear and able decisions on vital American policies." Upon the Philippine question his voice was heard with no uncertain note. In the Porto Rican and Philippine decisions he helped to destroy the absurd governmental fiction that our insular possessions could be considered part of the United States at one time and not at another. An ardent woman-suffragist, his democracy made him also resent bitterly the exclusion of the Chinese, against which he publicly protested. His broad humanitarianism naturally made him a warm advocate of an international court to pass upon all differences between nations. These are but a few of the great public services he rendered, but they should illustrate clearly the sound Americanism of a man the country can ill afford to lose. How much his death weakens the Supreme Court we can to-day hardly venture to estimate.

"Personally," says Arch-Insurgent Poindexter of Washington, "I can't see a great deal of difference between a Rules Committee run by Speaker Cannon and a Rules Committee run by Speaker Cannon's friends." There are many people to whom the difference between the Rules Committee of two weeks ago and the Rules Committee of to-day will be more apparent. There are many people even who could detect a difference between a Rules Committee run by Speaker Cannon two weeks ago and a Rules Committee run by Speaker Cannon to-day. It would be denying the Speaker his undeniable share of shrewdness to suppose that he does not recognize the significance of the great three days' battle in the House. The Speaker knows that he holds his place by sufferance and that any attempt at reviving old methods will bring the sword down once and for all. Hence it is a morally chastened band of Cannonites that now sit on the Rules Committee. Their position is not unlike that of poor Abdul Hamid II, whom his former subjects keep for the sake of the good they can still get out of him—in the form of fat and frequent subsidies. The Cannon lieutenants remain at the throttle because their experience cannot be dispensed with for the time being. But like the heroic young engine-driver of our boyhood days, the Cannon engineers are doing their duty with a couple of insurgent road-agents' pistols at their heads.

To the maker of political cartoons, the decline and somewhat mitigated fall of "Uncle Joe" Cannon will come as a heaven-sent boon. It is not often that such a delightfully fresh bit of material falls to the lot of the newspaper artist. That trade, in accordance with the laws of its own being, must deal with unchanging ideas. Mr. Roosevelt, once he is born as a Rough Rider with prominent teeth and eye-glasses, is always that. Mr. Taft is naturally destined to go down into pictured history as stout and good-natured. The future can only bring variations on the theme. Mr. Cannon, in the same way, had impressed himself on the country as a vigorous septuagenarian with a cigar, who ruled over Congress and did and said what he pleased. Fixed in his character, he was only susceptible to minor daily variation at the hand of the newspaper artist—to-day, he did this to suit himself; yesterday he did that to suit himself; and that was about all. But an Uncle Joe Cannon who is not a czar, but a beaten man, an Uncle Joe whose cigar does not tip defiantly upward like an oriflamme, but droops sorrowfully downward, like a closed umbrella, is something so novel, so refreshing, that every newspaper artist in the land will hail it with delight.

Not in years has anything occurred in New York to hearten honest men like the conviction of Jotham P. Allds, State Senator from Chenango. For of all the attempts to punish corrupt legislators this is the first in which the Legislature or one of its Houses has found a member guilty of a criminal act. Throughout

decades decent men with some pride in the good name of New York State have hung their heads with shame. The traffic in laws and legislators was, if not open, notorious; the price paid at times a matter of definite rumor. Nevertheless, honest Governors, honest officials, honest reformers, and the honest press were alike baffled. It was all a little too indefinite; the libel laws made the printing of specific charges without corroborative evidence almost impossible of attainment. The corrupt traffic seemed beyond attack, for the bipartisan political machine which shared the profits protected its men. Hence the startling character of the charges, made by Senator Conger, published in the *Evening Post*. They were the flash of lightning that revealed the exact workings of the system of corruption before which decent citizens had been powerless—which even Governor Hughes in the insurance investigation was unable to lay bare. The conviction of Allds himself was of minor consequence save that the accused man had just become, thanks to unworthy machine bosses, leader of his party in the State Senate. The whole guilty crew of political pirates—masquerading under the name of one party or the other, but closely bound together by the cohesive power of political plunder—stand condemned today with Allds the pirate captain. They are the men who have thwarted the most unselfish and the most high-minded Governor New York has ever known in his efforts to redeem the reputation of the Empire State. Upon his measures have they fleshed their knives and used the pistols in their belts, with their black flag flying over their heads. They are now face to face with a day of reckoning.

Once more the attempt to obtain a ship subsidy has failed in Congress—this time because Representative Steenerson charged that improper influences were at work. There is to be an investigation into this charge forthwith, and it may be that something specific will develop. But no one should forget that there are always improper influences behind this bill, masked under patriotic appeals to "show the flag in all the ports of the world." It is a proposal that the United States shall take from its Treasury the cash sufficient to make unprofitable enterprises profitable. Ship subsidies mean that a new class of favored business men shall be created by the United States consenting to become a partner in the business—the kind of partner who puts a lot of money in and takes mighty little out. They mean another form of special privilege at a moment when the whole country is in revolt against every form of special privilege. Finally, they mean that the old law of trade that men shall buy where the goods are cheapest is again to be interfered with by statute. Americans buy the use of foreign tonnage because it is cheaper than American, just as they buy some German goods because they are cheaper than any available in America.

The story of fire insurance brigandage at Albany brings out one truth upon which the *Nation* has laid stress before this. Those business men and corporations who have been the victims of "strike" and "hold-up" bills have themselves largely to blame. If, instead of tamely submitting to blackmail, they had invested the blood-money in the hire of legitimate counsel and publicity, if instead of becoming a party to a crime they had carried the fight to the blackmailers, they would have done well by themselves and by the State. This is not theory, but fact. It is fact established by the very experience of the bribers themselves. When the exactions of the Albany gang became intolerable and the threatened interests, in very desperation, refused to be bled any longer, the gang held its peace. For this one thing is to be kept in mind: It may be hard to fix the charge of bribery on the "hold-up" practitioner; but these gentry dislike, just the same, to have the charge made. After all, there is a public opinion to which they must make some concessions, and a constituency that might ask embarrassing questions. A business man with his back to the wall and threatening exposure is something which the most redoubtable gangsman respects.

By the organic act of July 1, 1902, Congress prescribed that no one person should purchase more than forty acres of land in the Philippines, and no corporation more than twenty-five hundred. Ever since, there has been wailing and gnashing of teeth among the Americans in the archipelago who are there merely for exploitation purposes, and corporations have been loud in their statements that no large business enterprise can be made to pay in the Philippines under the present restrictions. These enactments have been the one bulwark of the Filipinos against the fortune-seeking American, whether of the respectable class or of the kind that disgraces us in Chinese and Japanese ports. Now, there is a scheme up in Congress, sanctioned by the Administration, to upset virtually this whole policy by putting on the market in large lots the 400,000 acres of land purchased from the Friars by the United States—these comprising some of the richest lands in the islands. Attorney-General Wickersham has ruled that these lands do not come under the organic act. If they do not, it is of the utmost importance that they should be brought within it. It would be a lasting shame to the United States if this misappropriation of public lands, which ought to be held in trust for the common people of the Philippine Islands, should be diverted to the uses of the Sugar Trust or similar concerns, or be made the bait for luring large capital to the islands.

The suggestion has been made that all the problems connected with the patent rights of the Wright brothers should be solved at a stroke by acquiring the rights for the free use of the public through a process of condemnation. The inventor's right to the exclusive use of his invention does not stand on the same footing as the right of property in general; the law recognizes this fact in the limitation of the right to an arbitrary term of years. Now, the choice of this particular method of rewarding the inventor is based upon specific considerations of expediency, and not upon any broad or fundamental principle. There is no reason in the nature of things why the term should be seventeen years rather than seven or seventy; there is no reason why exclusive possession for a term of years should be the form which the right should take at all. Doubtless it is the best form in general; and probably the duration now provided by the law is what it should be. But if any wise method could be devised for permitting the alternative of extinction of the patent by public purchase in cer-

tain cases, a great deal might be said in favor of such a plan. The stimulus to invention which it is the purpose of the patent system to provide would be amply supplied. One of the possible consequences of such a provision might be the checking of monopolies which do not consist in, but are greatly fortified by, patent rights. But the practical difficulties in the way of any such scheme are unquestionably great.

An unexpectedly cheerful turn has been given to the Princeton situation. Personal contact between President Wilson and Mr. Procter, in the course of the annual meeting of the Western Association of Princeton Clubs, has led to what looks like a good understanding between the head of the university and the man whose offer of a gift for its graduate school gave rise to a commotion so extraordinary. It is pretty safe to assume, in all such cases, that whatever real differences of view may exist, the apparent differences become vastly greater in the course of a heated controversy; and while it is unquestionable that Dr. Wilson's position has represented a distinct and aggressive opposition to certain tendencies at Princeton, the incidental acerbities of the dispute were what gave it its apparently unmanageable character. The present outlook seems to be that the fundamentals for which President Wilson stood will be thoroughly safeguarded, and at the same time that those on the other side will be satisfied that the conditions of the original offer were rejected in no spirit of mere contentiousness.

The Manchester *Guardian* is one of a number of Liberal newspapers utterly out of patience with the truckling of the Asquith Administration to the big-navy mania. The ship-building programme of this year gives England a predominance over Germany more than 50 per cent. higher than Mr. Asquith demanded a year ago, on a statement of alleged facts as to Germany since proved to have been wrong. Mr. McKenna's speech of March 14, in presenting the navy estimates, the *Guardian* says, was addressed largely to the Conservatives as if it were "more important to have their approval of the Estimates than that of his own side." As the *Guardian* points out, on this issue the Liberals should seem to be entitled to greater consideration from a Government of their own than the Opposition. Thousands of Liberals are deeply exercised over estimates of $200,000,000 in which they see "a prospect of further increase next year, a serious menace to the free-trade finance which the recent budget, it was hoped, had made secure for a time."

Let every jingo and every military officer who thinks that a nation's fate depends solely on permitting army men to manage its affairs betake himself to Greece. There militarism has run its course and reached its logical conclusion. The soldier does not there have to stultify himself by going to the Parliament or Congress to ask for those means of defending the country which he *knows* to be absolutely necessary if the land is not to meet the most ignoble of fates. He orders the King to do his bidding. This he has accomplished through the agency of a Military League with no nonsense to it. Here are its latest demands, sent to the Prime Minister, with the quiet intimation that if they are not granted he will have to search for a new occupation, and that the King, too, may find himself homeless:

> The dismissal of all the higher officials in the public service, the more competent of whom may possibly be reappointed; the dismissal of the fifty-eight professors of the university, some of whom may be reappointed; a series of changes in the electoral law, among them being the restoration of small electoral districts, in which it is thought non-party delegates could be more easily returned; the expropriation of the landlords in Thessaly, and the establishment of peasant proprietors in their place; the removal of the royal stables from the centre of Athens; and the establishment of a Ministry of Agriculture.

Besides this, the League announces that it will "purify the army" by a secret committee, which will retain or expel officers as it sees fit. No room for the mollycoddle there; none for the peace-at-any-price man or the craven.

From Russia comes a useful differentiation between two terms that are generally used as synonymous. In assuming the office of President of the Duma to which he had just been elected, the Octobrist leader, Guchkoff, took pains to lay it down in so many words that Russia to-day has a constitutional, but not a parliamentary, form of government. In other words, what is left now of the representative assembly of four years ago which fought for the establishment of ministerial responsibility and even had hopes of resolving itself into a constituent convention, is only a very large advisory council whose advice the monarch is *a priori* prejudiced against, as emanating from a body elected by a more or less popular vote. Germany and Japan do not recognize the principle of ministerial responsibility; but in both countries this only means that the monarch reserves the right to pick out the men who shall help him govern in conformity with the will of Parliament. In Russia, the very powers of the elected representatives of the people are virtually dependent on the Imperial sufferance. The Czar's decree may nullify the Duma's decision or enact into law anything the Duma has refused to sanction. The Duma has been only a mockery of a Parliament, and the Government has rendered the world a service by refusing any longer to keep up the pretence.

The usually well informed and responsible Shanghai correspondent of the London *Times* sends to that newspaper some rather startling statements concerning the present status of the vernacular press of China.

> Concisely stated, the change which has overtaken the native press is that it has passed under the control of the Chinese official. At the present moment there is hardly a newspaper worthy of the name in China which is not owned or subsidized by the Mandarins, and the result, as shown in their columns, is that the outspoken criticism of two years ago is generally replaced by a spirit of comfortable acquiescence in the established order of things.

This ominous change has been brought about, we are told, through the enforcement of arbitrary postal and registration regulations quietly introduced under the authority of the Central Government, and by means of which "the existence of any journal in Chinese hands can be made to depend upon its attitude toward the officials." In Shanghai alone "a list of the owners of the leading newspapers, which provide ideas and information for a very wide circle of readers, includes the Shanghai Taotai, the Governor of Manchuria, the Viceroys of Chihli and Kiangsu, and a certain high official interested in the sale of anti-opium pills." Under such conditions the awakening of China is likely to be a slower and more painful process than has been expected.

THE JUDGE IN THE PRESIDENCY.

Mr. Taft is the first President who received his chief training for public usefulness on the bench. Chase and Davis aspired in vain to a nomination for the Presidency, Parker made a campaign and was defeated. Hence the experiment of placing in the highest executive chair a man with the judicial habit dominant is a novelty to the American people. The man himself had from the start many misgivings; but a large body of his fellow-citizens felicitated themselves that the country was now to have a chance to catch its breath after nearly eight years of strenuous leaps and bounds. Even the retiring President paid his successor the unique compliment of saying: "Taft will give you a better administration than mine, for he will be able to build deliberately where I have had to play the pioneer and clear the ground."

The expectations aroused by Mr. Taft's candidacy were due largely to an appreciation of that difference between the man with the judicial habit and the man without it, which rests on the difference between impulse and law as motive powers. It was felt that after seven years of Roosevelt the development of the Presidency for a while in the serene atmosphere of a Federal Circuit Court would be a good thing for the government. Besides, much weight was naturally attached to Mr. Taft's experience in administration as Governor of the Philippines, and afterwards as Secretary of War. Not enough allowance was made for the fact that his mission to the Philippines was rather in the character of a benevolent magistrate, with a gift for healing ruptures in the family circle and straightening out tangles in the social fabric, than as an executive head for a government in working order. A like purpose animated his acceptance of the war portfolio; for that kept him in touch with the dependent people who had so trusted him, while its ordinary administrative responsibilities could be shifted to other shoulders.

That neither President nor country has enjoyed the restful year so cheeringly prophesied must be confessed; and it now seems profitable to inquire whether Mr. Taft's activities as President have not been hurt rather than helped by that judicial habit from which so much was hoped. Take the two incidents which have done most to rouse factional feeling in the Administration's own party—the tariff fiasco and the Ballinger-Pinchot convulsion: how do they lend themselves to this view? In the latter case, the President's duty was obvious from the beginning. No leader of a great forward movement can tolerate a quarrel between his lieutenants which imperils the efficiency of the organization. They are where they are for the purpose not of pulling apart, but of pulling together; and it is the business of their chief to say to them: "Gentlemen, you must either settle your differences at once, or he who insists on fighting must resign and conduct his further hostilities from outside of the service." That is the fashion of the executive officer who realizes that the task committed to him is the accomplishment of certain large results, not the arbitration of personal disputes. Instead, Mr. Taft laid a hand on the shoulder of each combatant, gave both his friendly counsel, and thus nursed their controversy along instead of chopping it short with a single blow. The effect of his forbearance was to protract the feud, intensify its bitterness, and project its most dramatic episode into the midst of a session of Congress—a consummation always avoided by executive officers of experience.

The tariff incident involved the same principle. Mr. Taft was elected on a platform which, as he was fully conscious, pledged him to a definite course as far as the President's prerogative could be extended in a matter ostensibly legislative. The man with strong executive instincts would have stated quietly but clearly where he stood and what he was willing to approve, and, failing that, he would have marked his protest by vetoing or pocketing the unsatisfactory measure. But Mr. Taft wasted good energy in weighing drachms and scruples of sophistry offered by the Congressional oligarchy to excuse their betrayal of the people's confidence, just as he had been accustomed from the bench to give the accused person the benefit of every possible plea in defence or mitigation.

So far as the American voting public were seeking a change of methods in the White House, they wished to replace haste with deliberation. But the experience through which the nation is now going points to the moral that there are other differences between the judicial and the executive habit besides a difference as to deliberation. Singleness of aim and directness of action are as truly of the essence of good executive work as studied equipoise and impartiality of interest are of the highest judicial excellence. And this contrast suggests that the drafting of an admirable judge for executive duty is likely to unfit him for a return to his old domain. Granted that he gets no moral taint whatever from his contact with the sordid side of politics, he is still exposed to hostile criticism. Just as we find a strong public sentiment averse to judges' submitting themselves as eager candidates for elective office, so we meet thousands of citizens of fair intelligence who refuse to believe that a man transferred from a political to a judicial position does not carry with him the prejudices acquired in combat with the opposition forces, and the aggresssve—perhaps the domineering—spirit which he has had to call into action now and then in pressing an important administrative measure.

It should, of course, always be borne in mind that the Presidential candidacy of Mr. Taft was of an entirely different kind from that of the judge on the bench seeking political office. He had long been engaged in important administrative tasks; and, when his name first began to be mentioned for the Presidency, he was not only not anxious for that office, but was known greatly to prefer a seat on the Supreme Court bench. His Administration has still all manner of possibilities before it; but if it should prove in the end as disappointing as there is now reason to fear that it may, this result, in the case of a man with his broader experience, will stand in the future as a warning against selecting for the Presidency men whose claims to it—unlike those of Mr. Taft—rest solely on the ability they have shown in judicial office.

THE HANDWRITING ON THE WALL.

The astounding Democratic victory in the election of a successor to the late Congressman Lovering of the Fourteenth Massachusetts District must make even President Taft realize how the country feels about the Payne-Aldrich tariff. Rarely is the meaning of an election written so clearly on the face of the returns. Ten thousand men who in 1908 voted the Republican ticket, have now, only a year and a half later,

voted for the Democratic candidate. More than that, they cast their ballots for a man who only recently deserted the Republican party because he could not endure the tariff iniquity. Mr. Foss made his campaign on the tariff and the high cost of living, and took pains that every voter in his district should understand his attitude. It is idle to say that the lack of popularity of his opponent had anything to do with the outcome. Mr. Lovering obtained in 1908 a majority of 14,250; the present reverse is certainly due to deep-seated popular dissatisfaction with the present Administration in Washington. One must go back to 1890 to find parallels to it. Even then it would be difficult to do so, for this particular district never before elected a Democrat to Congress. The handwriting is on the wall.

This becomes still plainer if one studies the district: The Fourteenth stretches south of Boston to the edge of Cape Cod. It includes three important manufacturing cities, Taunton, Brockton, the home of the shoe industry, and Attleboro, famed for its jewelry manufactures. Within its confines are a number of smaller towns from which commuters travel daily to Boston, while many summer residents, who live in Boston in the winter, maintain their voting residence in such home-towns as Scituate, Duxbury, Plymouth, and Norwell. In addition, this district includes long stretches of farming lands. It would not be easy to find anywhere a district of more diversified character, or more representative of American life. But farmers and manufacturers, small shopkeepers, metropolitan business men, and shoe-factory employees voted alike, throwing off with equal ease the thralldom of a party with which most have voted all their lives. Scituate, for instance, gives Foss 153, and Buchanan 82; in 1908, Lovering received 214, and the Democratic candidate 71. In Norwell, in 1908, there were but 46 Democratic votes to 147 Republican; now only 45 Republicans vote for their party. What could be clearer? What more convincing?

If there are any doubters, we would recall to them the Democratic landslide in the late Congressman De Armond's district in January, and refer them to the fresh reports of Democratic successes in local elections throughout New York State. No wonder Mr. Taft feels that a Democratic House is inevitable. As it appears today, nothing but the Democrats themselves can prevent a political overturn. Will they again come to the rescue of their political opponents? That is the question hundreds of thousands of voters asked themselves when they read the news from Massachusetts. It is extraordinary, the number of Republicans on all sides who feel that they have been "buncoed" by the tariff bill; who are dissatisfied with the Taft Administration. They are as eager and as ready to vote for Democrats as the old-line Democrats who have been driven out of their party are eager to return to the fold. So wonderful an opportunity has not been presented to the Democracy since the blight of Bryanism descended upon it. On all sides the Republican ranks are broken by party dissensions. There are now two kinds of Republicans—those who desire to see the party's alliance with special privilege continue, and those who would have it severed, and severed promptly. Where the West has taken its stand the upsetting of Cannonism in the House bears testimony. How the East is prepared to act Mr. Foss has demonstrated by his brief campaign of only two weeks.

Will the Democracy rise to the opportunity before it? There are gratifying evidences that it is coming to its senses. Behind Mr. Foss stood some of the best of the "William E. Russell Democrats" in the Bay State. Their return to leadership is in itself as hopeful a sign as the activities of the Democratic League in New York State. But most encouraging of all is the way the Democratic minority bore itself in the crisis in Congress. It stood shoulder to shoulder without dissensions, without any such desertions to the Republican ranks as marred its record of years. Congressman Burleson may have blundered tactically in forcing his resolution to oust Cannon, but it was sincerely meant and was in pursuance of the ordinary duty of an opposition to capture the positions held by its enemy. Despite the pro-Cannon vote, the Democrats are bound to obtain great credit throughout the country for their stand. In the West, particularly, people are certain to feel that the Democracy showed its trustworthiness by aiding in a reform of the House.

It is not without significance that the new Democratic opportunity comes in connection with the party's old winning issue, the tariff. If it had but had a Grant to lead it through the Wilderness of the last fourteen years, with the demand that its cohorts should fling themselves upon the tariff breastworks of the enemy, wherever found and however concealed, the Republican Richmond would have fallen ere this. Now, the Democrats enter the campaign handicapped by their votes in the last disgraceful scramble for tariff favors when they, too, yielded to the temptation to put money into their constituents' pockets. But the country in its present temper is certain to be lenient if the Democratic leadership in the coming elections be but bold and straightforward and sincere. Better now than in 1890 and 1892 do men understand the real nature of the tariff and how poisonous is its influence upon all forms of our industrial and political life. Thousands besides the shoemakers of Brockton have seen through the absurdity that it is essential to the welfare of the American workingman, and have penetrated the myth that high prices make for happiness and comfort or that cheap goods make cheap men. Altogether the situation is such as to cause every Democrat to take heart and the country to rejoice at the promised restoration to influence and efficiency of that Opposition it so sorely needs.

THE BUDGET TANGLE IN ENGLAND.

The reports of the British Exchequer on the Government's current tax receipts illustrate in an interesting way the situation created by the hold-up of the budget. Some of the schedules and rates in the English tax system continue automatically from one year to another, in accordance with previous Parliamentary grants to that effect. Others require an annual vote before their collection can be insisted on. The income tax falls into the second of these categories. Since the Lords refused concurrence in last April's budget, and since the Commons have not reënacted that or any other tax bill, the income tax has been gathered, so to speak, only on sufferance.

From a summary of the fiscal situation, prepared by the London *Economist*, it appears that certain new customs duties prescribed by the held-up budget

are being collected in full, and that the same thing is true of the tea tax. This, one may suppose, is because the Government has power to insist on payment of these taxes, and is reckoning in any case on the validation of these taxes whenever a budget is enacted. But neither the liquor license tax of the budget of 1909, nor its new stamp taxes, have been exacted or paid at all. As for the income tax, which is always in the nature of a yearly grant of supplies, the *Economist* thus describes the situation:

(1.) The old duties on earned incomes, graduated up to £2,000 a year, are not being generally paid, because the demand notes have not been sent out. Some district commissioners have sent out, and a certain amount of the tax has been received.

(2.) The enhanced duty of 1s. 2d. in the pound sterling on unearned incomes is still being deducted by the bankers, in spite of the fact that there is no legal authority for its payment. Some bankers have paid, others have not. Companies have deducted their income-tax, but practically none of them have paid.

(3.) The super tax on incomes of more than £5,000 a year is not being paid, and those who have been asked to provide the materials for their assessment for this tax have in many cases stoutly declined to provide any information in the absence of an act of Parliament.

Whether or not the Government, in accordance with its past practice, has been deducting the income tax from its quarterly payments of interest on the public debt, does not appear; supposedly, the tax has not been deducted. But taking the actual collections as they stand, the latest British Government revenue statement received by post, covering operations for the first week of March, shows only £363,000 collected on property and income tax in the United Kingdom, against £2,538,000 for the same week last year. Since April 1, 1909—the beginning of the fiscal year—£12,420,000 revenue has been received from that service, as compared with £27,881,000 in the same period a year ago. The entire public revenue, during these eleven months, has fallen £14,000,000 short of the preceding fiscal year, and this in the face of £8,000,000 increase in public expenditure.

A deficit of nearly $100,000,000 has thus been created up to the present date; and to meet it the British Government has already borrowed heavily, and must borrow more. But the most anomalous fact in the case is that, while the Exchequer is borrowing to make good the growing shortage, money set aside by citizens for taxation purposes is accumulating in the English banks. This money will not be paid until a budget is definitely passed; but since no one can surely know at what moment that event may happen, the banks are necessarily cautious as to lending out such deposits except on very short time.

Almost the only quarter in which exactly this employment of the deposits is possible is on the Stock Exchange. The perfectly natural result, therefore, has been a superabundance of money placed at the temporary disposal of borrowers for speculative purposes; and here we have one of the most interesting explanations of the outburst of speculation in shares of mines and oil companies and rubber companies, which has already become a sensational incident in the London market. When one reflects that the termination of this extraordinary dilemma rests wholly on the policies which, for purposes of political strategy, may be adopted by the factions in the House of Commons, it will be seen how unusual a situation has arisen.

It is to be supposed that some way out of this tangle will be found by Parliament, other than the continuance of such expedients as the sale of $105,000,000 five-year Exchequer bonds, to make good this absolutely artificial deficit. On general principles, we should certainly suppose that the mere spectacle of such chaotic conditions in the British public finances would lead to some early settlement, at least of the budget legislation. The Asquith Ministry itself must be aware that responsibility for prolongation of such conditions will be placed on the shoulders of the Government, and this quite regardlessly of the dispute as to who was primarily at fault for the failure of the budget of 1909.

There is much force in the argument, set forth by sober political organs in Great Britain, that whatever is said of the general policies of a Ministry, its first and imperative duty is to carry on the government and provide the requisite supplies. A Ministry which does not or cannot do this thereby confesses its inability to govern, in accordance with all Parliamentary tradition. But whether considerations that are conclusive in normal times will have anything like their customary effect at a time of such Constitutional ferment as is now going on in England, is something that at the moment baffles prediction.

THE RETURN.

It would be a ridiculous error to say that forty centuries look down from Egypt's monuments upon the leader of the Smithsonian African Expedition. It is inconceivable that anything in nature or proceeding from the hands of man should look down upon Col. Roosevelt. On the contrary, if the special correspondents on the banks of the Nile are at all to be believed, things have been looking up in Egypt ever since the ancient land has come into touch with that buoyant, compelling vitality. Khartum has listened to a commencement sermon on the advantages of education. Luxor has been refreshed with a few thoughts on the proper sphere of woman. Thebes has looked on while the Colonel raced his mount over the sands against three competitors, and beat them all. The last incident, we must confess, stamps itself upon the mind as peculiarly characteristic, appropriate, and beautiful. The ordinary soul may be hushed into reverent silence by the mystery and the majesty of this tremendous Past. It is for the extraordinary spirit to be always and everywhere itself, strenuously equestrian at Thebes, taking a hand at tennis, perhaps, on the site of Babylon, punching the bag a little at Damascus, defiant alike of the Past and the temperature.

A good number of things have happened in the last ten years that have proved Mr. Rudyard Kipling a very poor prophet. The latest of his vaticinations to go by the board is that East is East and West is West and never the two shall meet. The two have met in their most essential, in their most historic, form, when Mr. Roosevelt stands in the shadows of the temple at Karnak. In degree of contrast, the meeting between East and West at Marathon, or when cross and crescent battled under the walls of Vienna, is insignificant. Two years ago, these States were torn with uncertainty as to what was to be done with Mr. Roosevelt after March 4, 1909. The imagination of man exhausted itself in putting him into the most incongruous places. It pictured him as discovering the North Pole, or turning the Sahara into a garden by means of irrigation and dry farming, or establishing peace by force of arms in troubled South America. No one thought of Mr. Roosevelt in conjunction with Egypt. And how could one? The problem was

to find something for him to combat that was as strenuous as himself. The terrors of the Arctic would do reasonably well. The perils and horror of the desert might do. But Egypt, the dead; Egypt that rests indifferent to the rival claims of the virtuous man and the malefactor, the dynamic man and the mollycoddle, the small producer and the Trust; this Egypt was impossible.

And so they stand now face to face, the West and the East, the new and the old, Mr. Roosevelt and the Sphinx. What the Sphinx thinks of Mr. Roosevelt we shall probably never know. What our ex-President's views are concerning the Sphinx we shall know very soon. The riddle of the ages will at last be answered. Many obscure points in Egyptian chronology will be cleared up. The Pharaohs, with their dynasties, their queens, and their high priests, will be put in their proper place. We shall know now the Pyramids were built. We shall get the final word on just how the Israelites succeeded in making bricks without straw and how the fording of the Red Sea was effected. Every problem will be studied, we are sure, with insight, with fairness, and with complete knowledge, though it is too much to expect that all will be treated with sympathy. For it is natural that there should be much in the land of the Nile that will displease and even anger Mr. Roosevelt. He will chafe at the unparalleled amount of nature-faking on the monuments. The dog-headed god Anubis, the cow-headed Isis, Horus, Osiris, and Ra in their various zoölogical manifestations, will be treated as they deserve to be, gently perhaps, but firmly.

The Smithsonian African Expedition's sojourn in Egypt has not been a very prolonged one. At the present writing, Mr. Roosevelt is in Cairo or near there, on his way to lecture before the students of the University of Berlin in German, the students of the Sorbonne in French, not to speak of the University of Oxford in English. What will be the final effect upon Egypt of his brief visit? Will Mr. Roosevelt do what the Roman legions failed to accomplish, and rouse the East from its age-old slumbers? Or will the East prove the stronger of the two, and, after a little while, forget its distinguished vistor, forget the newspaper correspondents, and the tourists from Iowa and South Dakota, who, in the shadow of the temples at Philæ, unanimously renominated Mr. Roosevelt for President in 1912, and go back to its own ways? The future will show. But if Egypt does refuse to awake, we should once for all abandon our empty boast about the superiority of our own civilization to that of the East. If two such tremendous products of Western civilization as the Assuan dam and Mr. Roosevelt fail to make an impression on the drowsy Orient, nothing ever will.

A SUCCESSOR TO CHATEAUBRIAND.

The death of Viscount Marie-Eugène-Melchior de Vogüé last week marked the passing of a picturesque figure in French intellectual life. To describe him in a word more precisely is difficult. Novelist, essayist, literary critic, historian, moralist, prophet—all of these he was, and more. Indeed, any one who is at all acquainted with his writings is impelled at this time to ask not so much what he was as what he might have been. For, like many another author, he was the victim of his versatility. If only he could have been just one of the many things he was, or, at any rate, one of them at a time, there is no telling to what a height he might have risen.

His development is easy to follow. He was born in 1848; fought in the Franco-Prussian war, which fired him with a rampant patriotism, and in the next dozen years was attached to the French embassies, successively at Constantinople, Cairo, and St. Petersburg. To the splendor and mystery of the Orient he responded sympathetically in such essays as "Syrie," "Palestine," "Histoires orientales." More important than the Orient, however, in formative power, were the seven years spent in Russia, during which by various sketches he stirred his countrymen to an enthusiasm for Russian life and literature. The extent to which he strengthened in this way the bonds of friendship between the two countries was largely responsible, no doubt, for his election, at the age of forty, to the French Academy.

In any case, he owed to Russia his spiritual awakening. Specifically, this came from the novels of Turgenieff, Dostoyevsky, and Tolstoy. In the pictures there presented of toiling, patient, heroic peasants, he seemed to find not only a superior sort of realism, but a new, abiding gospel. He says, in the preface to "Le Roman russe," which appeared in 1886, "The new art tries to imitate nature in its unconsciousness, its moral indifference. It expresses the triumph of the masses over the individual, of the crowd over the solitary hero." This was an ingenious quirk given to an old idea. Horace, among others, had smiled sadly at the sum total of man's endeavors compared to the relentless march of time; but it was the joyful acceptance of this principle and the poetic glory which M. de Vogüé cast over its workings that appeared for the moment new, even revolutionary. Far from depressing the masses, he held out to them hope and enthusiasm, presenting to them visions in which man, though but a particle of dust, made nevertheless with his fellows that great highway of the race which emerges from a limitless past and stretches to a brave future. Democracy he called this; it was an adjustment of art to the ruling spirit of the age. Such remained the outlook of M. de Vogüé to the end.

More than anything else, it was this outlook, this stand, which gave to him among his contemporaries a certain distinction. It led him, in an age when art for art's sake was so much the talk, to insist that literature should embody a moral, capable of being understood by the many, and to hold that the writer's mission is to act as a guide to the average human soul. It gave him also a religious faith at a time when science was diffusing the spirit of skepticism. What his actual creed was he could, to be sure, never quite say. "Croyons!" was his watchword. In what? In the vision he had seen, in the past, in the future—in a great cosmic sweep. This attitude, which substituted general religious sentiment for a definite belief, has been termed Neo-Christianity. His position led him likewise into a strange sort of mysticism. For ears properly attuned there are, he thought, voices from the beyond; not quite music of the spheres, rather voices nearer at hand, which connect things visible with those unseeen and strengthen one's sense of the solidarity of the universe. We hear, almost see, such voices in "Les Morts qui parlent," written in 1899, voices of the dead guiding the living; we find them somewhat better explained in the essay, "Regards historiques et littéraires," of 1892.

The eyes of his age were upon him,

looking for some strict system of thought and conduct, but were soon doomed to disappointment. The mind of M. de Vogüé was too alert, too impatient, to rest long upon one object; it was sufficient for him to glimpse hidden meanings and to attempt to phrase them off-hand into eternal verities; to be forever reaching out towards a larger environment. It was said, with some truth, that he could not write four lines without lapsing into universals. Enthusiasm for his ideas he did at times inspire, especially in the minds of the students who grouped themselves about him, and called him prophet. And indeed, such ideas as his, brilliant in impulse but often inchoate, are just the sort that startle and inspire listening youth, but that make quite a different impression when scrutinized in book form. M. de Vogüé belonged to no school and never succeeded in founding one himself. An exile he has been called, because of the loneliness of his position. He fancied he had seen a great light, yet never could tell quite convincingly what it was.

Of a piece with his general habit of thought were his methods in pure literature—a brilliant, misguided versatility. He was too fluent a preacher to be a novelist. In "Les Morts qui parlent" and in "Le Maître de la mer" the moralizing gives to the stories both their point and direction, turning at the same time the characters into puppets. Undoubtedly, however, he will be remembered for pages here and there, especially for certain descriptions of nature which, like those of his master, Chateaubriand, are written in poetic prose, touched by a tender, quickening symbolism. Whether it be a winter-scene in Russia, the gleam of the Orient, or the "twilight meadows" of France, he shows a caressing touch, a happy buoyancy, an insinuating fancy.

THE SPECIALIZED UNIVERSITY.

Lord Rosebery has recently suggested that the university might solve the increasingly difficult problem of the multiplicity of subjects by what he calls co-operation. Each university, that is, shall leave to the community the vexed question of the relative importance of different studies, and concentrate its efforts frankly on whatever group of subjects it feels itself most qualified to teach. Thus instead of many little trees of knowledge we shall have one large tree, of which each university (the name can be retained only by courtesy) will be a highly developed branch. It is not meant, of course, that the differentiation should be carried to all possible lengths. It would not be necessary to journey from New York to California, or even from Leeds to Manchester, in order to pass from a course on mineralogy to a course on palæontology. There would be, let us suppose, three great types of university—the classical, the scientific, and the historico-economic. In each of these, subjects not directly related to the particular function of the institution might still be pursued to a certain point; but they would hold a subordinate place without reference to any estimate of their final utility.

Now, this seems at first glance a sufficiently reasonable proposal. We are ready to grant that there would result a large economy of effort, and that each great institution would attain results in its chosen specialty that are now beyond its reach. If the aim of university education were simply and solely to increase the sum of human knowledge, there would be no more to be said. The case would be parallel to that of the industrial world, and we all know what specialization has accomplished there. But to those of us who look to universities not so much for the advancement of knowledge as for the advancement of learning (the distinction is by no means fanciful), the proposed "coöperation" has very much the look of disintegration. To us it seems fully worth while that a considerable amount of efficiency, of measurable attainment, should be sacrificed in order that the catholic temper of university life may be preserved.

Specialization has already been carried very far in the freedom of choice allowed to the individual; but at least the student mind maintains something of the old tradition of a liberal education. No one scholar is in danger of thinking his own particular field of interest a cosmos. There is a constant incitement in the direction of a philosophic attitude toward knowledge. The scientists have a wholesome fear of mere empiricism; the classicists of pedantry; the metaphysicians of sophistry. But if the scheme of specialization among universities were carried out, all this would inevitably be changed. That fine humility in the face of the vast field of intellectual endeavor which it is one of the great functions of a university to instil, could never be developed under such a system. Every one would know, of course, when he stopped to think about it, that his intellectual vista was only the foreground of a great estate, but his normal habit of mind would be quite unaffected by this consideration. The men produced by the system would be among those of whom Newman wrote, "They see the tapestry of human life, as it were, on the wrong side, and it tells no story. . . . Nothing has a drift or relation; nothing has a history or a promise. Everything stands by itself, and comes and goes in its turn, like the shifting scenes of a show, which leaves the spectator where he was."

Above all, if Latin and Greek are to be preserved—and it is largely on the ground that they will thus be saved that Lord Rosebery makes his suggestion—it will not be by isolation. The sciences might appear to prosper by the separation, though they would certainly become cold and hard at heart. But the classics would indeed dry up and wither. They would be preserved—as pressed flowers are preserved—but the free air of the world would no longer be scented with their fragrance. If they are to take anything like their former position, it will be rather from a common reëstimation of their value at the heart of education than from any such artificial separation.

A GREAT FRENCH PHILOSOPHER AT HARVARD.

The Hyde lectureship, which has year after year brought to Harvard some splendid object-lesson of the way in which popular lectures may best be given, has never till this year taken a philosopher as its example-setter. This year we have been having Prof. Emile Boutroux, and the occasion seems to me so well worthy of commemoration that I venture to set down a brief account of it for the *Nation's* readers.

The whole enterprise of international exchange of professors is still in its tentative infancy, and one may hear as many arguments against it as reasons for it. The Hyde foundation requires all lectures to be in the French tongue, and the first thing that has been disclosed is the appalling rarity of ability to understand spoken French, even in a centre of learning like Cambridge.

M. Boutroux's auditors this year

should preëminently have been our students of philosophy; but, victims of the deplorable manner in which they have been taught foreign languages, hardly half a dozen of them have shown their faces. Few, even of our instructors, follow a French lecture easily—though many more can follow German—and what with "other engagements," and the terrors of the title, "Contingence et Liberté," of M. Boutroux's course, their number proved so small that the bulk of the audience consisted of world's people from Boston and elsewhere, including a good number of French visitors attracted, I am sure, less by the particular subject, than by the rare pleasure of hearing any intelligible discourse whatever in the language of the far-off native country.

It is obvious that the institution of professorial exchange needs overhauling. It ought to be a means of vital stimulation, of making our somewhat torpid youth aware of the presence of a wider world about them, human and social as well as intellectual. So far it has missed fire in this respect. Our young fogies in the graduate schools continue working for their Ph.D. examinations by moving, like Faust's Wagner, "von Buch zu Buch," "von Blatt zu Blatt," and remain for the most part quite unconscious that an opportunity has been lost to them.

M. Boutroux is one of the veterans of his country in the sphere of philosophy, and an extraordinarily influential personage in all academic lines of activity. Almost every philosopher of the younger generation has been his pupil; one finds him sitting as a judge at every *soutenance de thèse* for the doctorate in philosophy; he attends congresses; has been since its foundation *directeur* of the Institut Thiers, and is president this year of the Academie des Sciences Morales et Politiques, where he will shortly have to welcome Mr. Roosevelt as an *associé étranger*. He is a somewhat ascetic looking figure, with a very French and rather military physiognomy, but with the kindliest of manners, a power of extraordinarily clear statement, and, above all, a great air of simplicity and sincerity while lecturing.

M. Boutroux, like almost all his compatriots, thinks it no praise to say of a lecturer that "he talks like a book." German and Anglo-Saxon lecturers may talk like books, but the idea of a public lecture in France is different. It ought not to furnish information of details as a book does. It ought rather to confine itself to tracing perspectives, defining tendencies, bringing out contrasts, and summing up results. It ought, above all, to generalize and simplify, and it ought to avoid technicality of language. Needless to say that, for this task, complete mastery of the subject is an indispensable condition, and only the great masters have succeeded greatly as popular expositors. M. Boutroux's single lectures on Pascal and on Comte showed the breadth and simplicity which result from absolute mastery of a subject.

His continuous course, entitled "Contingence et Liberté," consisted of eight lectures, and the high originality of his position here is what, in my eyes, entitles his visit to notice beyond the immediate circle of his listeners. M. Boutroux is, by virtue of priority, the leader *de jure* of the reaction against the abstract, and in favor of the concrete point of view in philosophy, which in the last few years has got under full headway in all countries. The leader *de jure*, I say, meaning the historic leader or precursor, for the leadership in loudness has passed in England and this country to more strident voices, and in France to those more radically revolutionary in tone. Boutroux is above all a liberal, grants cheerfully to the opposing side what it can fairly claim, harbors no enmities, and makes no enemies, so that many a convert to "pragmatism" or to "Bergsonism" has remained ignorant that the ball was set rolling by his first publication, "La Contingence des lois de la nature," away back in 1867. His freedom from polemic virulence, his indisposition to flourish a party flag, have kept his name more in the shade than has been just. The most important features of "pragmatism" and "Bergsonism" find clear expression in that early work. And the *Weltanschauung* of that work, matured and reinforced, but in no wise altered, was what this course of lectures reaffirmed. Deemed paradoxical when it first appeared, that *Weltanschauung* is now recognized as possibly discussable, to say the very least, and is evidently about to enter on a powerful career.

I can only sketch the essence of it briefly, without following the lecturer's own order, or going into any detail. The quickest way to get at the character of anything is to know what to contrast it with. The best term with which to contrast M. Boutroux's way of looking at the world is the "scholastic" way of taking it. When I say "scholastic," I don't use the word historically, but as common-sense uses it when it makes of it a reproach. In this sense scholasticism is found in science as well as in philosophy. It means the pretension to conceive things so vigorously that your definitions shall contain all that need be known about their objects. It means the belief that there is but one set of thoughts which absolutely tell the truth about reality, and it means the claim to possess those thoughts, or the more essential part of them. If the word "scholastic" be objected to, let the word "classic" be employed. M. Boutroux's bugbear would then be the classic spirit, and he might be treated as a "romantic" in philosophy.

H. Taine has attributed the misfortunes of France in the revolutionary and Napoleonic periods to the rule of the classic spirit, with its trust in immutable principles and rigorously logical applications; but Taine himself, so far as his general view of man and nature went, cherished classic ideals. If we look back to his time, we find a different idea of the meaning of "Science" from that which the best investigators have now come to believe in. Taine, Berthelot, Renan, and the other great influencers of public opinion during the Second Empire, thought of science as an absolute dissipator of the mysteries of nature. It stripped reality naked of disguise, revealed its intimate structure, was destined to found a new morality and to replace religion. Its votaries were to be the high priests of the future, and the destinies of our planet were to be committed to their keeping. John Fiske's favorite word "de-anthropomorphization" serves as a good summary of this whole way of thinking.

Carried away by the triumphs of chemistry, physics, and mathematics, these men imagined that the frame of things was eternally and literally mechanical, and that truth was reached by abstracting from it everything connected with personality. Personal life is a mere by-product, it was said, and its categories, though we have to live in them practically, have no theoretic validity. At the present day, however, concepts like mass, force, inertia, atom, energy, are themselves regarded rather as symbolic instruments, like coördinates, curves, and the like, for simplifying our map of nature and guiding us through its jungle. But the whole undivided jungle, with our personal life and all, is the reality immediately given; and though it is given only in small bits at a time to any one, yet the whole content and quality of it is more completely real than that of any of those conceptual substitutes.

This was the central thesis of Professor Boutroux's lectures. Whereas the classic and scholastic tradition is that reality is above all the abstracted, simplified, and reduced, the inalterable and self-identical, the fatal and eternal, Boutroux took the diametrically opposite view. It is the element we wholly live in, it is what Plutarch's and Shakespeare's pages give us, it is the superabounding, growing, ever-varying and novelty-producing. Its real shape is biography and history, and its "categories," far from sterilizing our world for all purposes of living reason, keep fertilizing it infinitely. "Reason" is a term which Professor Boutroux rescues from its purely classic use of tracing identities, concealed or patent. It is for him the faculty of judgment in its widest sense, using sentiments and willingnesses, as well as concepts, as its

premises, and abounding in power, as everything else does, the more abundantly it is exercised.

The practical gist of his whole contention was that reality means novelty, elementary and genuine, and not merely apparent. For the classic rationalism, elementary novelty would be synonymous with Absolute Chance at the heart of things, and that is inadmissible. "Pure irrationalism and sentimentalism" would then be the verdict on Professor Boutroux's *Weltanschauung*. But Boutroux is above all things a liberal and mediating mind, and loves not harsh oppositions. If novelties came abruptly "out of whole cloth" and juxtaposed themselves to the existent, like dominoes against dominoes in a game, the world would be as bad a field of rattling bones as the "irreducible" categories and concepts of classical philosophy make it. Not chance, therefore, but "contingency," is the idea which Professor Boutroux prefers to work with; and by contingency he means the element of spontaneity which characterizes concrete human life—where the consciousness of the present is ever of *many* future possibilities, and contains always enough causality for either of them, when realized, to be regarded as its natural effect. Which *shall* be realized is meanwhile uncertain until our living reason makes its choice. Ever something new, but never anything entirely new. No literal imitation like that which is postulated as the "uniformity of nature," yet always imitation in the midst of the variation; and an "order" unlike that "logical" order, where the same comes only from the same, and which is all that mathematical science can imagine—an order satisfying other kinds of demand, and yet not disappointing the intellectual demand that the effect shall in *some* way grow out of and continue all that went before it.

In this sense the entities of science, the molecules or energies, and the equations that express their laws, are previous in reality only in the way in which "grams" and "metres" are, or only as a statue is previous in its rock. The creative touch of human reason was needed in each case for the extrication; and that those particular creations resulted rather than a hundred others just as possible, is one of those selective interactions between living minds and their environment which can be "understood" when once it has occurred, but which no acquaintance with the previous conditions can show to an outsider that it was the sole thing possible. Theories result from psychological variations, just as Roosevelts and Rockefellers result from biological variations. Both variations are adapted partly, and partly non-adapted. They change the world-situation and are changed by the world-situation; but the resultant new situation is always a unique one, and none but the agents of its production are in a position vitally to understand why or how it comes into being.

With such a view it would seem natural to interpret the non-human environment as enjoying also an interior life. Panpsychism of some kind, although the lecturer did not enter into that consequence, would seem, in other words, to be a rightful part of his system.

The great originality of M. Boutroux throughout all these years has been his firm grasp of the principle of interpreting the whole of nature in the light of that part of it with which we are most fully acquainted, namely, our own personal experience. The filling in of the picture will require endless research of detail, but the working direction, once given, cannot be easily forgotten; and it seems not unlikely that at a future not remote the whole earlier efforts to substitute a logical skeleton of as few "immutable" principles and relations as we can dissect out cleanly for the abounding richness and fertility of the reality we live in, and to call this skeleton the deeper truth, will seem an aberration. It is essentially a view of things from the outside, and knows nothing of how they *happen*. M. Boutroux has steadily called his generation to take the inside view of how things really happen.

Even less than I expected, have I followed his own order or language, but it is too late to re-write. Those readers who know something of present-day philosophy will recognize in my account the same call to return to the fulness of concrete experience, with which the names of Peirce, Dewey, Schiller, Höffding, Bergson, and of many minor lights are associated. It is the real empiricism, the real evolutionism, the real pluralism; and Boutroux (after Renouvier) was its earliest, as he is now its latest, prophet. It keeps us on cordial terms with natural life, and refuses to divorce our "philosophy" of men from the world of our bosoms and our business.

WILLIAM JAMES.

Harvard University.

NEWS FOR BIBLIOPHILES.

In the *Nation* for May 9, 1909, the first part of the "Trial Bibliography of Colonial Virginia," by William Clayton-Torrence, published by the Virginia State Library, was noted. That first part ended with 1754, the latter part of the manuscript having been destroyed in a fire in the printing shop. The second part, coming down to 1776, has now been printed. Just 250 imprints are included. Except in a very few cases where copies of the books could not be located, lined titles are given, libraries possessing copies are indicated, and often some note as to the author, the contents of the book or tract, and its historical importance is added. Of especial interest are the several tracts relating to the so-called Walpole grant on the Ohio River, a business in which Franklin was interested; also the series of medical treatises, mostly in Latin by the Virginia graduates of the University of Edinburgh; and the tracts by Landon Carter, Richard Bland, and John Camm on the "Two-Penny Act" passed by the Virginia Assembly in 1758. Session Laws, Assembly Journals, and Almanacs supply many entries, as do also the issues of the *Virginia Gazette*, which are entered annually and the files of which, so far as known, are located.

The first New Hampshire Register, "Civil, Military, and Ecclesiastical Register of the Province of New Hampshire," Portsmouth, 1772, a little pamphlet of sixteen pages, giving a list of the Province and county officers, clergymen, officers of Dartmouth College, etc., brought $525 at the Stickney sale at C. F. Libbie & Co.'s in Boston, on March 23. Four copies are known, one imperfect. Mr. Manson's copy uncut, sold in the same auction room in 1899 for $33. Perhaps on account of the war no second Register was issued until 1787. Stickney's copy of this issue brought $9. The third Register, for 1788, the earliest seen by Sabin, brought only $6.50.

A number of interesting and valuable American books and pamphlets are included in the collection (partly from the library of Henry Clay), which the Merwin-Clayton Co. will sell on April 5 and 6. The first printed collection of the Laws of Kentucky (Lexington, John Bradford, 1799) and the earliest extant American printed Laws of Virginia (Williamsburg, William Parks, 1733) are perhaps the two most notable items. This latter book is not quite "the earliest surviving evidence of printing done in Virginia," as the catalogue states, though it may be the earliest procurable in the market by the present generation. The John Carter Brown Library possesses the only known copy of the earliest known Virginia imprint, "Typographia. An Ode on Printing," by John Markland, Printed at Williamsburg by William Parks in 1730; and several other pieces are extant printed there before 1733. There is evidence also that printing was actually carried on many years earlier. On February 21, 1682, John Buckner was called before Lord Culpeper and his council for printing the laws of 1680, and he and the printer, one William Nuthead, were put under bond of £100 "not to print anything hereafter, until his majesty's pleasure shall be known." Of this earliest printing in Virginia we have no further knowledge. We may once more reprint Gov. Sir William Berkeley's famous statement made in 1671: "I thank God we have not free schools nor printing; and I hope we shall not have these hundred years. For learning has brought disobedience and heresy and sects into the world; and printing has divulged them and libels against the government. God keep us from both."

When the new printing press was established at Williamsburg in 1730 by Parks it seems to have been largely through the assistance of William Gooch, Governor of Virginia, and the pamphlet "Typographia" mentioned above was, as the author states in his dedication to the Governor, "occa-

sioned by the setting up a Printing-Press in Williamsburg." William Parks had carried on a printing office in Annapolis. On February 1, 1728, he made proposals to print a collection of the Laws of Virginia, but the volume did not appear until 1732. It is a copy of this which is to be sold at auction next week. Clayton-Torrence notes nine other copies. Gilbert's copy sold in 1873 for $32.50 and Brinley's in March, 1880, for $20.50.

Books and pamphlets on the Stamp Act and the Revolution; books on Masonry and Anti-Masonry; a collection of manuscripts relating to the Republic of Texas; Burk's "History of Virginia" (1804-16), with the scarce fourth volume; and an autograph letter signed of Daniel Boone are other lots included in this sale.

Correspondence.

THE CARNEGIE FOUNDATION DEFENDED.

To the Editor of The Nation:

Sir: I have watched with great interest the discussions in your columns and elsewhere of the recent changes in regard to the award of pensions by the Carnegie Foundation, but I have looked in vain for any defence whatsoever of those changes. That there should have been *some* adverse criticism was inevitable, but that all enlightened criticism should have been hostile is astounding when one dispassionately considers the situation.

Certainly no one can doubt that it was the sincere wish of Mr. Carnegie to further the cause of higher education in this country. Some tentative plan for the distribution of the funds had to be mapped out, but to expect any plan to have anticipated from the start all unseen difficulties and dangers is certainly requiring too much of limited human powers. This the framers of the plan in their wisdom understood, and the right was reserved to make *any* changes that experience might prove necessary or desirable. This reservation was clearly stated at the outset, and any ignoring of it by teachers is inexcusable.

Now, after four years' trial, it appears that the plan as originally undertaken cannot be carried out. The pension list has suddenly grown enormously, owing to causes that one would least expect. If institutions are inclined to take advantage of the situation and to try to divert the gift from its original purpose to the solving of local difficulties of administration, if teachers individually are inclined to follow the letter of the rules without any regard to the spirit and to claim a share of the spoils, the Foundation is in honor bound to stop such procedure straightway in order to safeguard its high purpose. This it has now attempted to do by removing the cause inherent in Rule II. If the pension list must be kept within fixed bounds, if curtailment must come, the directors have undoubtedly thrown the burden where it can best be borne; that is, upon the younger and more able-bodied members of the teaching profession.

One hears much of the ethical question involved in the sudden change. Some even go so far as to declare that there has been a breach of faith on the part of the directors of the Foundation. It is quite possible that some teachers have made plans on the basis of the old rule, but since the Foundation has again reserved the right to deal with individual cases, we may rest assured that all worthy claimants will meet with justice. It was stated by the directors in the beginning that pensions were to be awarded only to professors in colleges on the accepted list, again with the reservation of the right to deal with worthy cases elsewhere. According to the last report of the President, more than one-third of the professors now drawing pensions are from colleges *not* on the accepted list. No one, however, seems to have raised the ethical question here. To be sure, I do not recall having seen anywhere a word of praise for this admirable generosity, but I assume that silence has not been due to disapproval. In case the directors had seen fit to change Rule II merely by substituting fifteen years for twenty-five years' service, would the ethical aspect have been emphasized by the critics?

Another criticism often seen is that the Foundation shows a tendency to meddle with college affairs and that it is not safe for such large powers of coercion to be vested in an outside body. To me this power of control seems destined to bring great pressure for good upon our present loose educational system. The Foundation evidently from the first recognized that the best and most lasting results could be obtained by starting with institutions themselves. The lack of any general supervision over our higher education has led to shameful abuse, and to our national disgrace "colleges" and "universities" have been allowed to spring up everywhere with full authority for conferring academic and professional degrees. If the Carnegie Foundation will continue boldly to point out what a true college standard of scholarship shall be, if by its efforts some institutions shall be induced to raise their present low standards and others be forced to unmask their blatant hypocrisy, if this much alone shall be accomplished by the Foundation, its efforts in the cause of education will not be in vain. We have long needed some fearless, disinterested body to point out abuses in our present system, and this has been done in an effective manner for four years by the Foundation. The President has not hesitated to comment on any unseemly practice, whether it be political corruption at the University of Oklahoma or vulgar advertising at Harvard. The annual reports summarize in masterly fashion the actual condition of things, and sound advice is there given by a skilled educator for the remedying of flagrant abuses. It is hard to see wherein the danger to true education lies, so long as the Foundation is supervised by such a body as the present directors.

A TEST OF ORTHODOXY.

To the Editor of The Nation:

Sir: Let me contribute to the discussion of sectarianism in colleges the enclosed list of theological test-questions recently submitted to a professor of ancient languages in one of the oldest denominational colleges in Pennsylvania. The orthodoxy alone of this particular teacher (who is not a clergyman) had been called into question, and upon affirmative answers to these questions his further connection with the college was made to depend.

Morgan Barnes.

Ojai Valley, Cal., March 12.

Dear Professor X——:

You are asked to give categorical answers to the following questions:

(1.) Do you accept as scriptural the doctrine concerning God as taught in the answers to the fifth and sixth questions of the Shorter Catechism?

(a) "There is but one only, the living and true God."

(b) "There are three persons in the Godhead, the Father, the Son, and the Holy Ghost; and these three are one God, the same in substance, equal in power and glory."

(2.) Do you accept the testimony as to Christ's preëxistence and oneness with God, as set forth in the Gospel according to John, and in Paul's letter to the Philippians? John 1:1-8; Phil. 2:5-10.

(3.) Do you accept as historical the record concerning Christ's human birth, as given in Matthew 1:18-25; Luke, 1:26-35; Luke 2:1-20?

(4). Do you see in Jesus Christ not only the supreme revelation of God as through the highest and holiest of men, but view Him as God, "manifest in the flesh," as "the image of the invisible God," and "the effulgence of His Glory, and the very image of his substance," as set forth in the following Scriptures: 1 Timothy 3:16; Colossians 1:15-17; Hebrews 1:1-3?

(5.) Do you see in the life and death and resurrection and heavenly ministry of Christ God's method of redeeming humanity, and behold in the death of Christ the supreme sacrifice of love needed to bear away sin, and reconcile an estranged race unto God? 2 Cor. 5:18-21; Romans, 5:8-10.

(6.) Do you believe in the return to this earth of the exalted and glorified Saviour, who, according to His promise, will judge the living and the dead? Matthew 24:30-31; Matthew 25: 31-33.

ETYMOLOGY OF SLANG.

To the Editor of The Nation:

Sir: The volumes which have recently been added to the Century Dictionary contain (if the specimen sheets may be trusted) the following definition of the slang term *fan:*

[Said by some to be short for *fanatic*, but this implies a popular pronunciation fan'a-tic. Others associate the word with *fan*[1], which has various slang uses.] One who is very enthusiastic on the subject of athletic sports, especially baseball; one who haunts baseball grounds and baseball games; a baseball "fiend." [Slang.]

In what is here said about the implied popular pronunciation of *fanatic*, the etymologist seems to assume the following general principle; In the formation of a slang term by abbreviation, the first syllable of the original word will be selected only in case such syllable is accented. I venture to question the validity of this principle, and offer as evidence the following list, mainly drawn from the student vocabulary:

Original.	*Slang.*
gymnasium	gym
fraternity	frat
preparatory	prep
psychology	psych
semester	sem
condition	con
professor	prof
harharian	harb
οἱ πολλοί	poll
political economy	poly ec
plebeian	plebe
professional	pro
lieutenant	lieut
repuhlicans	reps

I may add as collateral evidence, "Die"

for Diana, as in Die Vernon. "Con" and "Prof" may have arisen from the written forms, but this cannot be true of all of the terms cited.

FRED NEWTON SCOTT.

Ann Arbor, Mich., March 21.

WHAT'S IN A NAME?

TO THE EDITOR OF THE NATION:

SIR: To describe Jane Austen in her own style, may it not be said that her preeminent qualities are reality and rectitude? Not long since I was impressed by the fact that the author's name seemed to express these or related qualities with surprising definiteness. It is well known that in daily life generalization commonly proceeds upon an unconscious basis. So I endeavored to find the source of the suggestion. It occurred to me that it lies in the similarity of the name to the word "austere," of which Austen might be regarded as a sort of softened, feminine form.

The question naturally followed, how far are we thus influenced, consciously or unconsciously, by the names of authors? That the name, at any rate, often contains the right suggestion is evidenced by the quizzical style of "Q.," the studiousness of Browning, the sombreness of Gray, the mildness of Lamb, the youthfulness of Suckling, the modesty of Lyly, the solidity of Dryden, the curiosity of Pepys, the subtle wit of Swift, the irony of Sterne, the madness of Chatterton, the commonsense of Johnson, the dictatorial mien of Pope, the rusticity of Cowper, the engaging style of Reade, the cumbrous weight of Drayton, the belligerency of Warburton, and the dreadful works of Strype.

ALBERT SCHUMAKER.

Leipzig, Germany, March 3.

GIBBON'S LIBRARY.

TO THE EDITOR OF THE NATION:

SIR: Edward Gibbon, according to his literary executor, Lord Sheffield, had the "damned, parson-minded idea of leaving his books to be sold." Beckford, the author of "Vathek," purchased them for £950—"to have something to read when I passed through Lausanne," he says. "I shut myself up for six weeks from early in the morning, until night, only now and then taking a ride. The people thought me mad. I read myself nearly blind. I made a present of the library to my physician" (Dr. Schöll). According to a note in the appendix to George Birkbeck Hill's edition of Gibbon's "Memoirs," p. 339, Dr. Schöll sold half of it to an Englishman named Halliday, living in Switzerland, who, in 1876, gave it to a gentleman in Geneva. "The other half," according to Mr. Hill, "was dispersed by sale, 500 volumes going to an American University."

Can any reader inform me what American university is referred to? If Gibbon made marginal comments like Macaulay, it would be interesting to ascertain his observations.

JAMES WESTFALL THOMPSON.

University of Chicago, March 23.

Literature.

THE EIGHTEENTH CENTURY.

The Cambridge Modern History. Planned by the late Lord Acton, LL.D. Edited by A. W. Ward, Litt.D.; G. W. Prothero, Litt.D.; Stanley Leathes, M.A. Volume VI. The Eighteenth Century. New York: The Macmillan Co. $4 net.

The volume of this great work which now lies before us appears as the last but one of the whole series, and covers, broadly speaking, the period from the Peace of Utrecht to the outbreak of the French Revolution. It overlaps Vol. V a little in respect of India, the story of which it takes up from the days of Bábar, as well as in respect of some of the minor European countries. There are in it twenty-four chapters, the composition of twenty-four writers, some of whom, however, contribute more than one chapter, while some contribute only a part of a chapter, so that it is not a case of a different writer for each chapter. Six writers belong to the European Continent—Professors Daniels, Michael, and Hötzsch, who are Germans; Professors Schöllenberger and Hubert, who are Swiss, and M. Lemoine, who is French. Several appear in the series for the first time. The best known to the historical world of the United States are Sir Alfred Lyall, Dr. Adolphus W. Ward, Messrs. Armstrong and A. L. Smith of Oxford University, the late Mr. R. Nisbet Bain of the British Museum Library, and Mr. Dunlop, whose long-continued labors in the melancholy field of Irish history have had less general recognition than they deserve. All the chapters are done in the same thorough and business-like way to which we have become accustomed in previous volumes of the series; and in all there is the usual, or perhaps an even greater, abstention from any decorative embellishment of the plain unvarnished facts. Some of these chapters, however, along with the merit of a lucid and carefully exact narrative, present a philosophic appreciation of the forces at work and a discriminating judgment of the characters of the principal historical figures which make them interesting reading. We have nowhere met with a better account, in a concise form, of the policy and personal traits of the Empress Catherine the Second of Russia, than that given here by Professor Hötzsch.

No part of the volume is better done than the few pages in which Sir Alfred Lyall sketches the history of the Moghul Empire in India, singling out its conspicuous features and touching on the characters of the Emperors Bábar and Akbar, with a graphic terseness which makes us wish that he had written a history of this remarkable Asiatic dominion, instead of only one section in a chapter. The experiment made in allotting the career of the elder William Pitt (Lord Chatham), to a German professor, is justified by the intelligent grasp which Dr. Wolfgang Michaels shows both of Pitt's character and of the political situation in England as well as of the state of Europe generally, in the middle of the eighteenth century. The remainder of the chapter, which carries English political history down to 1793, although done with care, seems to want breadth in its presentation of the main currents, for the general features are lost in detailing ministerial changes and party intrigues.

But the most interesting parts of the volume are those which bring on the scene the three leading figures—so far as general European politics are concerned—of the eighteenth century, viz., Frederick II of Prussia, the Emperor Joseph II, and the Empress Catherine II of Russia. Each has a type of character so far from usual in monarchs that it may be described as being among the most striking features of the eighteenth century. These sovereigns were all reformers, in some directions even zealous reformers, ahead of their time; and for that reason just the persons whom the time needed. Each of them had able ministers, but each was abler than any of those ministers, and far more enlightened than the nobility which surrounded their thrones. How much reform there was in the atmosphere of that time appears in the fact that one discovers the propensity even in second or third-rate monarchs, such as Leopold of Tuscany, afterwards the Emperor Leopold the Second, in Stanislas Poniatovski of Poland, and in Christian VI of Denmark, not to mention the far more remarkable Gustavus the Third of Sweden. All these rulers, and notably the last, as well as the first three, were heartily autocratic. With reforms looking towards a more popular government, tney had no sort of sympathy. If they had needed any justification for their despotic attitude, they could have found it in the fact that political liberty would, in the first instance at least, have retarded reforms of the administrative and economic order. The nobility was everywhere hostile to any curtailment of its privileges; the masses of the people were unprepared for power, though already becoming restless, and showing by insurrections here and there throughout Europe their growing discontent.

To one who reviews the century as a whole, down to 1789, three things stand out, as giving it a character of its own. The first is the decay of that ancient organization of society, both legal and economic, which had come down comparatively little changed from the Middle Ages. The old privileges of the nobles, the old serfdom among the masses, the old systems of local government in cities and rural areas, were antiquat-

ed, but continued to stand because, though intelligent men felt them to be obsolete, there was no constructive force to put something else in their place. They would, doubtless, have crumbled away sooner, had not the preoccupation of men's minds with religious passions down to near the end of the seventeenth century helped to turn thought away from them. When religious strife ended, the defects of the old and outworn structure both of society and of the state itself began to be perceived.

The second feature was the emergence of an interest in economic progress, coupled with that revival of economic prosperity which the advent of a period of greater peace had brought. There were, indeed, almost incessant wars in Continental Europe during the century, yet none comparable for ruinous effect on internal prosperity to the Wars of Religion in France or to the Thirty Years War in Germany. The minds of men were now turned towards economic questions. Colonies and trade began to be deemed objects worth negotiating or fighting for, and legislation occupied itself, often, no doubt, in an ignorant and short-sighted way, with commercial questions.

The third was that attitude or tendency which the Germans call the Aufklärung, "a clearing up," which was also a "clearing off" of so many of the beliefs, theories, established doctrines, prejudices, and superstitions which had come down from the Middle Ages and covered the sky of theology, philosophy, politics, and economics. The spirit of free inquiry, and the critical methods which that spirit began to use, acted as a solvent on the whole preëxisting scheme of thought, and on the respect for existing institutions; even those institutions which did not visibly crumble away, were largely undermined, and ready to fall at the first shock. The age of such reforming monarchs as Frederick, Joseph, and Catherine was also the age of Voltaire, Bolingbroke, Montesquieu, Hume, Rousseau, Adam Smith, and the French Encyclopædists. The march of thought as it appeared in the writings of these and other leading intellectual forces kept pace with and sometimes ran beyond the process of disintegration in institutions and the unrest of the masses of the people. There were, of course, great differences between the speed with which one or other change moved onward in different countries. In England, the constitutional changes of the preceding century anticipated the political troubles which might otherwise have arisen, and it was only in Ireland and the North American Colonies of England that the spirit of unrest became formidable. In Spain and Italy the power of the church had maintained a torpid acquiescence in existing conditions. But everywhere else the materials for trouble could be discerned. In the Belgian provinces of the Hapsburgs from one cause, and in their kingdom of Hungary from another, such troubles broke out. In France, externally less disturbed than some of the other countries, the solvent forces of opinion had been working on the largest scale, and it was in France that when the moment for an explosion came, the explosion was most terrible, shaking and rending the whole European Continent. So we may call the eighteenth century the Century of Preparation, as the nineteenth has been that of Destruction and Reconstruction, that in which the political changes towards which Europe had been long slowly ripening were carried through. The influence of the revolt of the American colonies was, it need hardly be said, profoundly important, not only in accelerating the revolution in France, but in its influence on opinion everywhere.

Reverting to the men of the eighteenth century, it is a noteworthy fact that among them we discover, except in America in the person of George Washington, no figure that can be called heroic. The seventeenth century presents not a few striking and impressive persons, some of whom, like Gustavus Adolphus and Oliver Cromwell, have certain heroic attributes. These are not wholly wanting in Henry IV of France and John Sobieski, to whom might perhaps be added Wallenstein. So the nineteenth century has had some men unquestionably of heroic mould. But the temper and spirit of the eighteenth did not breed heroes. With all his splendid gifts of intelligence and will, Frederick II of Prussia is an unattractive, almost a repellent, personality. Perfidious and cold-hearted, it is only in the nation which he raised to a place in the front rank that his talents can secure pardon for his faults. For a hero, even in the Carlylean sense, he offers material hardly better than does Voltaire. The vices of the German-born Catherine of Russia were dissimilar, but even more ignoble. The evidence of her complicity in her husband's death is, no doubt, almost as strong against Mary Stuart of Scotland as is the evidence against Catherine of her privity to the murder of Peter III, and Darnley was not, like Peter, on the point of murdering or divorcing the wife who anticipated him. Yet Mary has still admirers who deem her a heroine. She had a winning grace and a dignity which will make her, with her misfortunes, forever a child of romance. Catherine had no such charms and no one will make a romantic heroine of her. Gheat abilities and a resolute purpose prevented her defects from ruining, but not from degrading, her career.

The Emperor Joseph the Second, though intellectually inferior to the two last-named rulers, was a man of great talent and of better natural impulses than either of them. He was not so faithless: he had a heart. He loved truth and light. He was a friend, if not of civil liberty, yet of equal civil rights and of religious toleration. His failure through overhaste and want of judgment in the choice of means, to carry out the reforms he had projected, makes him one of the most pathetic among royal figures, and with one exception the only interesting person in the long line of the later Hapsburgs. That exception is his mother. Maria Theresa had something of the heroic in her. Without shining abilities, she had a fresh, strong, genial nature which won for her the devotion of her subjects and makes her still a living creature to us, redeeming the dulness of Vienna by a sort of loftiness and a sense of honor which the other monarchs of her time wanted. When one thinks of those monarchs, of the unscrupulousness of Frederick and Catherine, of the selfish profligacy of Louis XV, of such lethargic or sordid creatures as Anne and Elizabeth of Russia, Christian VI of Denmark, Philip V of Spain, and the first two English Georges, one is less surprised at the popularity which George III obtained during his earlier years in England. Compared to the other kings of his time, and of the time just before, he seemed an exemplary head of his nation.

We have little space left in which to refer to the last chapters of the volume which present a survey of the field of thought and literature. Chapter xxiii, on English political thought, takes up the subject with Hobbes, and carries it down to Bentham and Edmund Burke. There are many clever remarks, but the treatment is unsatisfying. Nor can English thought be dealt with apart from such great writers of the European Continent as Vico, Leibnitz, and Montesquieu. It is particularly strange that we find no treatment of the author of the "Esprit des Lois," whose work was for the field of critical and philosophic history possibly more significant than that of any other serious writer of the century, except Kant. Though himself uncritical in his way of accepting and using data, Montesquieu is, in a sense, one of the founders of the modern scientific method of handling historical and social materials. He marks a new departure.

The last chapter deals with the Romantic movement in Europe. In beginning far back, with Thomson's "Seasons," it does well: there was an undercurrent of feeling for nature and the natural even under the sway of Pope. It is, however, hardly possible to cover in fifteen pages this immense subject within the range of which fall so many splendid and powerful writers, among whom Goethe, Schiller, Wordsworth, Burns, Scott, Coleridge, Rous-

seau, and Chateaubriand are only the most famous. The central point of the movement is placed in Rousseau. The subject, moreover, is too subtle, too full of varying and interlacing currents of thought and feeling, to be adequately treated by an enumeration of the contributions of different poets or thinkers. Nevertheless, this enumeration has its value. It sets the reader thinking, and makes him look in places where he hardly expected them for streams tributary to the great current of influence which was carrying men's minds and tastes in one sense back to earlier times, but in another and more important sense into a new world, equally unlike the Middle Ages and the centuries that had followed them.

CURRENT FICTION.

A Modern Chronicle. By Winston Churchill. New York: The Macmillan Co.

It was nearly two years ago that the *Nation* welcomed, in "Mr. Crewe's Career," a marked advance in the mood and the art of a writer whose early novels had seemed to owe their great popularity to the fact that they showed little literary achievement or even promise. We noted that his style was still "without distinction, and often slovenly." But we noted also the absence of his early crudeness and pretentiousness, and the presence of a "ripened and admirable humor." In "A Modern Chronicle" (is the initial C an accident or a fetich with this author?) a still further development is apparent. Mr. Churchill's style can no longer be accused of slovenliness. These five hundred pages are clear of the blundering syntax to which, hitherto, the novelist has seemed cheerfully indifferent. Perhaps he has found an editor; but the supposition seems hardly necessary in view of other indications of Mr. Churchill's steady growth in power both of conception and of execution. "A Modern Chronicle" falls little short of distinction in either respect.

Its theme is that which has so anxiously engaged the attention of the novel-writing public during the past decade—the American marriage. Mr. Herrick, Mrs. Wharton, Mrs. Ward, Mr. Phillips—how assiduous they have been in turning the fateful exhibit this way and that, displaying it in all lights, and in quite all shadows, that we might not deceive ourselves as to its form and vesture. Mr. Churchill's present heroine, Honora Leffingwell, conforms pretty closely to the accepted type. She represents, that is, the sort of woman whom our contemporary chroniclers incline to accept as representative. Honora's Southern blood endows her with an air, but her face is set toward New York from the cradle: she is the feminine seeker for the centre of the whirlpool, where she fancies happiness is to be found coincident with the extremes of wealth and fashion. Her father has been a worthless snob and parasite, and an inherited tendency to calf-worship sets her in the wrong path. The right path and the right happiness await her in a quiet St. Louis home, but she does not see them. She marries the first New Yorker who proposes himself, an inherently vulgar person who cannot even give her the life of wealth and fashion she has expected. However, a man of the exclusive set is presently attracted by her, and through him she attains the social goal. Of course, he makes love to her in due course, but it is to another man of similar type that she eventually succumbs. This Hugh Chiltern is rather the least real person in the story—too much the dark villain-hero of conventional romance. Honora gets a Western divorce, so that she may give herself to him, and finds herself cut by "society," which chances to apply a spasmodic scruple to the special instance. Hence much humiliation for the pair, and a beginning of estrangement, destined to be unfulfilled by the lucky accident—or semi-suicide—which cuts him off. Honora becomes a refugee in Paris, and it is not till some years later that she is found and brought to life by the man she should have married in the first place.

By no means a startling plot; but handled with a touch so quiet and firm, a humor so unforced and pervading, as to assure the reader of a satisfaction rarely experienced in the somewhat turbulent field of the American social novel. Mr. Churchill is still a young man. He does not give in to the temptation of over-production, and each of his recent books has shown an increased maturity and power: we shall expect better and better things of him in the future.

The Shoulder-Knot. By Mrs. Henry Dudeney. New York: Cassell & Co.

A story based upon a fairly effective idea of the Jekyll-Hyde order, but hopelessly injured by its affectation of manner. The author seems determined to say nothing naturally. One cannot reasonably be taken aback that the heroine is pictured as "that rare thing—a perfectly lovely woman"; rarity in that kind is stranger in truth than in fiction. But when, a few moments after our introduction to her, we overhear her announcing to a maiden aunt: "I would mate with a mountain, or with the sea in storm; nothing calmer could hold me for long," we perceive that we have to deal with no ordinary Helen. On the heels of this announcement the predestined stranger appears. "The new-comer struck seriousness into the tinkling day; he infused drama, he was eloquent of weariness, desire, and struggle. He came from cities, from violence of living; he held no part with the good-tempered hills, with the little, lightly breaking waves, with the bells of silly sheep, and the song of June birds all afire with nesting-time." In short, he will serve: though not a mountain or a sea in storm, he has his advantages—being a poet with a familiar small devil that perches upon his shoulder and is half-visible at times to all observers. The perfectly lovely one has misgivings, but accepts him as her mate. The familiar thereafter increases his power. He turns out to represent an habitual "Sin of Sight"—an obsession which causes the poet to see foul images in all things visible, and which drives him to describe them in his verses. At length even the features of his wife and child seem repulsive to him, and he is halted on the verge of murder and suicide only by a lucky stroke of lightning which blinds and frees him. The conception is not without force of its grewsome kind—a kind which demands, however, the utmost simplicity and sincerity of treatment.

Thurston of Orchard Valley. By Harold Bindloss. New York: Frederick A. Stokes Co.

Fiction of the Canadian "bush," a comparatively new product, has followed pretty closely thus far the traditions of the British colonial novel. It has been content to deal, with due allowance for local conditions and "color," with the old material. The hero is almost invariably the fine young Englishman, the younger son or the disinherited, who comes to conquer the new life by virtue of blood and breeding. Heroically he takes the axe or crowbar in hand—that hand which becomes so piteously hardened and roughened to the eye of the spectator from home. Dauntlessly, with his own legs, he threads the pathless wild on his predestined way to wealth and the Finest Girl in the Northwest.

Mr. Bindloss is here, not for the first time, satisfied with the rehearsal of this simple but effective parable. His hero is the reigning "Thurston of Crosbie Ghyll" in the old North Country—"like his grandfather, roughed out of the old hard whinstane he is," according to the testimony of his tenants and hereditary subjects. He comes of a race of fighting, drinking, cattle-reiving squires. His acres go to pay for unprofitable mining ventures on the estate; and he makes for Canada, after being jilted by the mercenary maiden of his choice. He has studied engineering, but finds no use for his knowledge in the Northwest, and passes through a rough apprenticeship in logging camps and on the road. At last he stumbles upon a little contract which paves the way for his success as an engineer. The Canadian girl for whom, when once he has glimpsed her, his labors are, is understood to be uncommonly beautiful and virtuous,

though to the casual eye she appears remarkably like a vixen. At all events, young Thurston is pleased with her, and in the end carries her off with complacency. The narrative is adorned with the familiar gloss of treason and stratagem on the part of predestined adversaries in love and affairs.

The House of Mystery. By Will Irwin. New York: The Century Co.

We are not quite convinced by the character of Mr. Norcross, the railway magnate, who from his office window gazes down sentimentally upon a grave in the churchyard of old Trinity, and who is the easy victim of a clairvoyant in matters sentimental and financial. Nor does Mr. Bulger, his young friend, seem to be quite consistently drawn. Perhaps, too, Rosalie Le Grange, the humble medium, talks too much, while she is rescuing the heroine from the toils of the greater medium, and incidentally also freeing the railway magnate. Apart from these blemishes the story that centres in Mr. Irwin's mysterious house is captivatingly ingenious. High finance, spookish revelations, a fading heroine, a bold lover, a specious rascal, an honest charlatan, all surrounded by an atmosphere highly charged with what New York is coming to signify in fiction—what more could be desired of a novel meant for quick reading?

THE POETICS.

Aristotle on the Art of Poetry: A Revised Text with Critical Introduction, Translation, and Commentary. By Ingram Bywater, Honorary Fellow of Exeter and Queen's Colleges, Oxford. New York: Henry Frowde. $5.25 net.

Mr. Bywater's eagerly awaited edition of the "Poetics" is what was to be expected from the critical and austere scholarship of the editor of Heraclitus. Its strength lies in the constitution of the text, the illustration of usage, and the criticism of single passages rather than in the broad literary interpretation of the whole. A translation, to be sure, is grudgingly added "in conformity to a custom perhaps better honored in the breach"; there are conscientious notes on all debated points of æsthetic or literary theory, and an appendix quotes fifty-seven definitions of *catharsis* in chronological sequence from 1527 to 1899. But the editor's heart is not in these things. He "cannot repress a suspicion that if Aristotle could come back to life again, he would be surprised to find how large a meaning we are able to read into some of his more incidental utterances." And we cannot suppress a suspicion that Aristotle's editor feels more interest in discussing "the relation between the MS. known as Ac and the Renaissance MSS, and the value of the Greek readings which are, or are believed to be, recoverable from the Arabic version." In these discussions Mr. Bywater displays a profound knowledge of the history of the Aristotelian text and of the work of the older commentators, Italian, French, English, and German. He does not seem to have studied with equal care the literature of the past decade. He is apparently unacquainted with Finsler's "Platon und die aristotelische Poetik." He does not refer to Knoke's "Begriff der Tragoedie nach Aristoteles," and he has little to say of the problems with regard to the history of the drama suggested by chapters iii to v of the "Poetics." But, taken all in all, he has produced the most valuable commentary with which we are acquainted, and the English student who can afford to own both this book and Butcher's "Aristotle's Theory of Poetry and Fine Art" may spare himself the study of the voluminous German literature on the subject.

Into the detail of the commentary it is clearly impossible to enter. A comparison of the two translations would be very instructive. They differ only in points where divergence of opinion is permissible, the chief errors in Butcher's first version having been eliminated in succeeding editions. There is space only to compare their renderings of the famous definition of tragedy. Butcher's version runs:

> Tragedy, then, is an imitation of an action that is serious, complete, and of a certain magnitude; in language embellished with each kind of artistic ornament, the several parts being found in separate parts of the play; in the form of action, not of narrative, through pity and fear, effecting the proper purgation of these emotions.

Mr. Bywater translates:

> Tragedy, then, is the imitation of an action that is serious, and also *as having magnitude* complete in itself; in language with pleasurable accessories, each kind brought in separately in the parts of the work; in a dramatic, not a narrative form; with incidents arousing fear and pity, wherewith to accomplish *its* catharsis of such emotions.

On both the points which we have italicized, we think that Professor Butcher is more nearly right. In σπουδαίας καὶ τελείας μέγεθος ἐχούσης, the participle does not explain τελείας, but adds another item. In 1450 b 24-5, and still more clearly ib. 35-6, Aristotle explicitly tells us that completeness, wholeness, order, may exist without the magnitude essential to æsthetic impressiveness. For the possessive use of τήν (its), Mr. Bywater cites Kühner's grammar. But obviously, where a defining or specifying genitive follows, the article presumably refers to that. And Mr. Bywater offers nothing to defeat this presumption except his belief that τήν is intended to remind us of other forms of purgation mentioned in the "Politics." We do not need this interpretation in order to reach his sound conclusion that "such emotions" need not, on the one hand, be limited to fear and pity, or, on the other, be extended to include all emotions. That "such" may mean the "aforesaid" in Greek is no proof that it must always have that meaning. Aristotle probably used "such" because he did not wish to limit himself to pity and fear, but intended to include, more or less vaguely, associated and cognate feelings.

In the interpretation of *catharsis*, Mr. Bywater, as was to be expected, insists on the rigor of the philological game. Medical purgation is meant, and the genitive relates to the thing purged away, and not to the purified residuum. And if this were a subject for that kind of precision, he would undoubtedly be right. But it is not and never will be possible to express in a formula the total emotional effect of tragedy. And even the author of a vigorous and rigorous theory of the matter may lapse from consistency, as his commentators invariably will, unless they are mere philologists. "Purgation" is, in fact, "purification," and the two ideas are combined in Plato's use of *catharsis*. In the "Politics," Aristotle undoubtedly emphasizes the mere relief, or alleviating discharge; but we need not assume that he wrote the "Poetics" with that page of the "Politics" open before him, or that he ever worked the theory out in a complete and consistent statement either in the last part of the eighth book of the "Politics," as Finsler thinks, or in the lost second book of the "Poetics," as Mr. Bywater assumes. As a matter of fact, music and poetry both relieve and purify or exalt feeling. The equivocal word *catharsis* may express both meanings, and it is neither possible nor necessary to decide how far they were blended and confused in Aristotle's mind as he wrote this sentence. We may only be sure that no philologian will ever succeed in forcing the rigid and exclusive meaning upon poetic and literary students of Aristotle. Even if they begin with mere purgation, they will always slip back into Browning's interpretation:

> . . . . Small rebuked by large,
> We felt our puny hates refine to air,
> Our poor prides sink, prevent the humbling hand,
> Our petty passions purify their tide.

Sir Philip Sidney. By Percy Addleshaw. New York: G. P. Putnam's sons. $3.50 net.

An extraordinary book. The first impression is that it is the work of a mere amateur. Paragraphs without number are to be found which violate all rules as to unity and sequence, while the repetitions are so constant and so manifestly due to ignorance of composition as to exasperate the reader. Thus,

for instance, Sidney's manner of writing the "Arcadia" is described on page 342 and again at page 351, and of the two the last passage should precede, if both must be retained; Sidney's opinion of his novel is given on page 342 and repeated on page 350, etc., etc. There are many literary illustrations and parallels, often dragged in, as it seems, to impress one with the extent of the author's reading, and with about the same relation to the subject as epic similes to the main action. For example, while talking about Sidney's sister, the author suddenly introduces a two-page paragraph about Horace Walpole, giving some account of Walpole's life, his relations to Gray and Garrick, the apparent object being merely to refer to Walpole's opinion of Sidney. The climax of the absurdity is that this opinion does not refer to the Countess of Pembroke or the "Arcadia" at all.

Unfortunately, this impression that the author is seriously defective in scholarly knowledge, suggested as it is by his style, is deepened by a closer examination of the material. The treatment of Sidney's literary work and of his relations to other men of letters is far from satisfactory. He takes for granted a liaison with Lady Rich, and shows bad taste in the manner in which he writes about it. Even more unsatisfactory is the treatment of the "Defense of Poesy." He repeats that he sees no connection between it and Gosson's "School of Abuse," that the quarrel "will never be understood"; that Spenser's reference to Gosson's dedication ("was for his labour scorned") is not to be comprehended; that the whole quarrel is "abysmally unintelligible." Yet a careful reading of Gregory Smith's introduction to his "Elizabethan Critical Essays," of Professor Cook's edition of the "Defense," or a knowledge of the attack of the Puritans on poetry and romances, or some familiarity with the conventional Elizabethan "complaint" as to the "low state of poetry" as shown in Spenser's "Teares of the Muses" and in dozens of other places, would have rendered the matter anything but "abysmally unintelligible." Wholly absurd, too, is the suggestion (page 360) that Gosson dedicated his work to Sidney as a huge and insulting joke because Sidney was a known patron of the arts. Of course, it was nothing of the sort. Sidney was more or less identified with Puritanism; Gosson represented a phase of the Puritan attack on poetry; and mistakenly thought that by such a dedication he would please Sidney for his zeal and would gain social standing for his cause.

But if the occasion which gave rise to the "Defense" is "abysmally unintelligible" and a matter which "will never be understood," Mr. Addleshaw possesses a fund of information about the Areopagus that will excite keenest envy in the hearts of those who wish that the problems presented by this organization, if organization it were, could be settled. He speaks frequently of its meetings, seemingly as though it were a college literary society; it was at "the meetings of the Areopagus," we are told, that Philip and Spenser "became really intimate"; a rival society was started, and the members of the two societies "abused one another with hearty good will"; Spenser was churlish to object to Ireland, since there he had as good talk "as that afforded at meetings of the Areopagus."

About Spenser, too, he has much to say. The prose tract on the state of Ireland calls forth his righteous indignation; he reiterates his opinion that it is "one of the nastiest contributions ever made to English literature." On this, of course, Mr. Addleshaw has a right to his opinion; indeed, his view, unfortunately, as we think, is the conventional one. Yet Spenser's tract merely expresses a theory of government common in the Elizabethan period; it is no worse than that other much misunderstood document, Machiavelli's "Il Principe"; it only stresses what was the truth, that if Ireland had to be subdued, it were more merciful to the unfortunate people to do the job thoroughly and once for all and so clear the way for constructive policies; and it phrases the conception of the relation of the government to a rebellious colony always maintained by the English, even to the modern days of Indian problems and the Boer war, and maintained by the American Government in the last campaigns of the civil war and in the reduction of the Philippines. Why, then, this hue and cry about Spenser's essay on statesmanship, so expressive of the genius of the race? But to Mr. Addleshaw, this tract damns Spenser forever. "Beautiful as were his dreams and his verses, his life was querulous and not at all beautiful"; yet, "apart from his merits as a poet, he appears to have been a worthy man"; this notwithstanding that his tract on Ireland is "one of the nastiest contributions to English literature"; while the conclusion of the whole matter is that "there is really little to admire in Spenser as a man." After a school-boy blunder by which he confuses the Rosalinde of the "Shepheards Calender" and the Elizabeth of the "Amoretti" (page 269), he speaks of the "Epithalamium" as a poem "of great beauty" and continues, with utter inconsequence, "One cannot help thinking that Spenser was a difficult and even unpleasant man to deal with."

There are many errors in proof-reading, the most noticeable among them being peculiarly unfortunate in that they are proper names. Thus he speaks of James's rage at the allusions to his mother under the pseudonym "Dunessa" (page 270); "Bastia" occurs for "Bestia" in the title to Bruno's satire (page 199); Spenser is said to have lived at "Kilcoltman castle" (page 268); and we also find "Yorrick" (page 160), and "Eupheses" (Euphues) (page 163).

In a word, the book is badly arranged, inaccurate, viciously padded, and the best comment on it is to be found in the words which Mr. Addleshaw applies to Sidney: "He might indeed have thought more and written less with advantage." We have dealt with it at length because it is an example, although exaggerated in its faults, of a whole class of British writers who are inundating the market with amateurish biographies.

The Last King of Poland. By R. Nisbet Bain. New York: G. P. Putnam's Sons. $3 net.

Probably no Englishman had a better knowledge of the history of Northeastern Europe than the late assistant librarian of the British Museum, R. Nisbet Bain. He was well equipped in his knowledge of the Slavic and Scandinavian languages, active in scholarly research, and possessed of lively historical imagination. His posthumous volume on Poland is as sound as his previous works on Russia and Sweden. It is more than a biography of Stanislaus Poniatowski. It is a history of Poland in the eighteenth century and an analysis of the causes of her fall. Nowhere else in English can there be found a better description of the helplessness of the old Polish Diet, the violence and extravagance of the old Polish nobility, and the poverty and apathy of the peasantry.

This account of the First Partition is valuable, because heretofore the commonly accepted authorities (Beer, Sorel, Koser, and the volume in the Russian Sbornik) are from the diplomatic point of view of Poland's neighbors. Poor Poniatowski has hitherto flitted as a mere ghost behind the diplomatic network, but Mr. Bain makes him a man of real flesh and blood. Both before and after the First Partition he sincerely wanted real reforms in Poland which should check the increasing anarchy and save the republic from the designs of Frederick II and Catherine II. He desired to abolish the *liberum veto* and the right of "confederation" which was equivalent to the right to proclaim civil war. He wanted adequate taxes to support an organized army. And he did not wish to put the Dissenters, as Catherine insisted he should, on an equal footing with the Roman Catholics. For, as he wrote to his adored Madame Geoffrin, if this were done, "I can see nothing but a St. Bartholomew's Eve for the Dissenters and a harvest of Ravaillacs for myself. The Empress would make of my royal mantle a robe of

Nessus." That he could have completely succeeded in his attempts at reform is perhaps doubtful, in view of the fact that, six months before his election as King of Poland, Catherine and Frederick had cynically and selfishly signed a solemn secret treaty *not* to allow any of the needed reforms to be made. The treaty of April, 1764, the terms of which as far as they affected Poland were mainly dictated by Catherine and not by Frederick, is the real starting point and ultimate cause of the First Partition eight years later. If Poniatowski, even with such odds against him, had stood firm for reform, he might, so Mr. Bain thinks, have secured some improvements in Poland and possibly even averted the partition. But it was his weakness of character, and Catherine's knowledge of that weakness, which made it possible for her to pursue that reckless policy of interference which led to the partition and eventually to the extinction of Poland. He had not the courage to oppose her vigorously either in diplomacy or by force of arms when she made him her political catspaw in the interests of Russia. Nor was he willing to abdicate. His incurable optimism led him to fancy that, somehow, everything would come right in the end. After the disaster of the First Partition he made sporadic attempts to secure reforms in the constitution and be worthy the name of king, but he achieved no real and permanent successes. The best that can be said of him is that he "meant well," but like so many weak persons who mean well, he could, as Mr. Bain says, "always produce a thousand excellent reasons for going to the devil." He trod too lightly the primrose path of dalliance at a period when Poland needed a great leader to save her from the greed of her neighbors and the folly of her own magnates.

Romanticism, and the Romantic School in Germany. By Robert M. Wernaer. New York: D. Appleton & Co. $2 net.

The frequent and just reproach that literary studies, whether historical or purely critical, lack fundamental brainwork cannot be brought against Dr. Wernaer's book on the German romantics. His pages are steeped in reflection, and though his thinking is not always entirely clear or pertinent in detail, he has firm hold of a central purpose. That purpose is to portray the character and illustrate the failure of pure romanticism, but to plead for it as a constant element in the humanistic art, not only of the past, but of the future.

In this undertaking, Dr. Wernaer is hampered both by the choice of his illustrative material and by the limitations which he has imposed upon himself. He sternly excludes from his survey Hoffmann and Kleist, Uhland and Heine; for these were only followers of the original school, mere *Epigonen* of the pure doctrine of the *Frühromantik!* As a matter of historical fact, this view has, no doubt, an element of truth. But for Dr. Wernaer's thesis, the resultant method is unfortunate, since it wholly neglects the element of personality. A given doctrine depends not only for its effectiveness, but even, in a sense, for its truth, upon the quality of the men whose minds it conquers. Hence to judge the romantic movement by Wackenroder or Tieck or even Novalis is to do it but rude justice. For these writers, interesting enough in their degree, possessed no commanding gifts of either reflection or creation, and to compare them, as Dr. Wernaer does, to Shelley and Keats and Byron, is to play somewhat recklessly with literary values. The German romantics strove after the expression of universal ideas and universal values, the English romantics, at their best, achieved it.

But we do not hold a brief for romanticism. The pure pageantry of dreams has lost its charm, and seems to us, often enough, meaningless and tawdry. The great romantics all transcended it. Those who, like Hugo and Swinburne, did not, live on only as masters of an exquisite but cloying music. And therefore, Dr. Wernaer is right in pointing toward an art in which romanticism is to be but one element. This art—which he calls humanistic—shall be romantic in its richness, freedom, and variety; classic in its sanity, severity, and restraint.

In this prophetic description of the art of the future, Dr. Wernaer neglects the most potent literary force since the rise of romance. Nor is it easy to account for this neglect. For in romanticism itself lay the seeds of realism and naturalism. It is the romantic, not the classic, artist for whom "the visible world exists," and to whom that visible world ends by assuming a painful, but resistless fascination; it is romantic art that discarded, in every modern literature, the typical, generalizing adjective, and, seeking to express the specific quality, the unique aspect, forged the vocabulary of naturalism. The founders of modern realism were all children of the romantic movement. Flaubert wrote not only "Mme. Bovary," but "Salammbo"; Ibsen prophesied in "Peer Gynt," before he preached in "The Pillars of Society"; Zola bewailed the irrepressible romanticism in his own heart. It is because he ignores the ruling literary passion of half-a-century that Dr. Wernaer fails to formulate a sounder doctrine, a more illuminating hope. Not in any vague "obedience to the laws of human life" lies the coming humanistic art, but in the wringing of a new and spiritual beauty from that unflinching honesty of observation which the practice of the great naturalists has revealed.

It is quite clear, however, from what has been said, that Dr. Wernaer's book stimulates the reader to close reflection upon the essentials of literature. And this admirable quality leads one to look forward with interest to other studies from the same hand. But it is to be hoped that in these he will still further revise his text and purge his pages of the many unfortunate Teutonisms which still disfigure them.

Notes.

"The Undesirable Governess," the last of the three novels, by Marion Crawford, left unpublished at the time of his death, is announced by the Macmillans for early in April.

"The Political Theories of Martin Luther," by Luther Hess Waring, is announced by the Putnams.

The annual report of Henry Marcel, director of the Bibliothèque Nationale, published in the *Journal Officiel*, records additions during the past year of 6,079 books and pamphlets, 152,000 periodicals and newspapers, and 7,316 pieces of music; besides 9,547 foreign books, 71,000 foreign reviews and newspapers, 5,500 gift volumes, 347 manuscripts, 529 Greek and Roman coins, 457 engraved gems (the bequest of J. C. Séguin), and 7,980 prints.

"Everything means something, and that something involves our work and destiny," says F. C. Hubbard in the preface to his "Through Library Windows" (Broadway Publishing Co.); and so, in all probability, this book has some latent significance. One emerges at the last page intellectually untroubled, but drenched as with a soft rain of amiable emotion precipitated over "nature, literature, art, and experience." The author tells us what he possesses: a Colonial mansion midway between Boston and New York; a large collection of books and pictures selected and arranged with exquisite taste; a lot 200x400 feet in dimensions containing a river and a wilderness of trees, flowers, and birds; a ripe culture and "a conscious sense of the beautiful." "From the first," he says, "I was keenly susceptible to rich emotions and ecstasies and tears." He writes of all these things very joyously in a mood of staccato revery, sometimes naming his poetical delights with an almost Whitmanian accuracy, sometimes falling into curious grammatical and rhetorical faults—on the whole, suggesting a rather unhappy stylistic medium between that of Richard Jefferies and that of Horace Traubel. Probably the book will make the right kind of reader feel very good and very happy.

"George Meredith, A Primer to the Novels," is the ambiguous compliment in 403 pages, paid by James Moffatt (Hodder & Stoughton) to the so-called Browning of prose fiction. The busy, indolent, or unathletic mind may now master the plots of all the stories without reading any of them. Why those competent to go beyond the primer should need to begin with it is not easy to understand, unless it be intended, like the Lambs' "Tales from Shakespeare," for the very young. Certainly, to have given any occasion for a "primer" re-

flects terribly upon a novelist, who, we are assured, was an "artist to the finger-tips." The necessity of such a book granted, however, Mr. Moffatt's offering is entirely praiseworthy. His long critical introduction is generally well-balanced, appreciative, and well-written. It is also a pleasure to note that he has apparently read Thomas Love Peacock, an advantage not enjoyed by every critic of Meredith. He presents the plot of each novel clearly and succinctly, and supplies brief, useful annotations on dates, sources, parallels, purple passages, and the like. As a further grace, the book is admirably printed at the Edinburgh Press, on excellent paper with wide margins; it opens readily as a book should; and it is of a most agreeable physical lightness.

In his "Roger Williams: a Study of the Life, Times, and Character of a Political Pioneer" (Grafton Press), Edmund J. Carpenter shows himself a man of candid spirit, broad culture, and well versed in the lore of the period with which he deals. While doing full justice to the virtues and services of his hero, he sets down fairly the limitations of his character and the shortcomings of his long and active career. The estimate of Roger Williams is eminently just; each point, whether of blame or praise, is satisfactorily illustrated from the documents. The defect of the book is a certain absence in parts of good proportion. Such reprobates as Sir Christopher Gardiner, Thomas Morton, and Philip Ratcliffe surely deserve no extended mention in such a sketch; and, on the other hand, the friendship of Roger Williams with Henry Vane, fruitful as it was of good to Rhode Island, and, indeed, in a marked way, of good to humanity in general, should certainly have received more extended treatment. In view of the brief and cursory way in which Mr. Carpenter considers the relations of Roger Williams and Vane, it is fortunate that we have in the same year the special discussion of that memorable intimacy in the "Roger Williams and Sir Henry Vane" of the Rev. Dr. H. M. King. The latter book is a useful supplement to Mr. Carpenter's volume, which, though open to stricture in the way indicated, is nevertheless a work entitled to high praise.

The security of Britain and her oversea dominions has been engaging attention for some years. Public concern, at least in the British Empire, in the question is increasing, and at the Imperial Conferences held in London during the past summer it was much discussed. A volume of special interest in this connection is the recent work of P. A. Silburn, entitled "The Colonies and Imperial Defence" (Longmans.) Mr. Silburn, a member of the Legislative Assembly of Natal, is a colonial who is thoroughly familiar with the views and feelings of the citizens of one of Britain's important self-governing dominions, and hence his contribution to the general discussion of Imperial defence merits consideration. A few of the more significant chapter titles are: The Navy and the Colonies, The Empire—The Army, The Political Element in Defence, The Eastern Factor, An Imperial Council of Defence, and, Wanted—An Imperial Defence Policy. The author, after briefly outlining the territorial and political expansion of the British Empire, devotes a chapter to The Component Parts of Empire, in which, in addition to other facts, he summarizes the defence resources of each individual dependency. Apropos of the problem of defence is his treatment of the thorny question respecting colonial contributions to the British navy. He mentions the increasing popularity in the colonies of the axiom that "a navy of present or future strength is the requisite of England alone, be she the possessor of colonies or not; and, therefore, the colonies should no more be called upon to contribute to this navy than they should contribute to the London County Council." The policy favoring independent colonial navies, assiduously advocated by many colonial statesmen, is finding support in certain quarters in the United Kingdom. Mr. Silburn, therefore, would give a more literal rendering to the prefix "Royal" as applied to England's Navy, and would have it entirely controlled, as "a homogeneous body," from the British Isles. On the other hand, he would add the prefix "Imperial" to the Army of Britain and would have it in reality of empire significance. The volume is well stocked with facts and tables of statistics, and will form an excellent reference book. Some care, however, should be exercised in accepting all the opinions and generalizations of the author, a few of which are somewhat inclined to be partisan.

The Academy of Pacific Coast History, Berkeley, Cal., publishes as the second and third numbers of its first volume "The Official Account and the Diary of the Portolá of 1769-1770," the earliest report by white men of the discovery of the Bay of San Francisco. This will be followed by other documents relating the Spanish occupation and survey of that important harbor and region. The Spanish text is given with an English translation and an adequate introduction. The California Promotion Committee publishes also (San Francisco, 1909) an account of the March of Portolá by Z. S. Eldredge, accompanied by documents and handsome illustrations, the most valuable a photograph of the earliest map of San Francisco Bay. The Spaniards have been displaced and have almost vanished. They are "the other men" who labored. We have entered into their labors, and it behooves us to preserve with care the records of these half-forgotten forerunners.

Except for the pleasure it may have given G. Grinnell-Milne to prepare it, we see no good reason for the existence of his volume, "Tales from Tasso and Other Poems and Translations" (London: David Nutt). His purpose is to furnish a prose epitome of "La Gerusalemme Liberata," interpolating from time to time metrical translations of passages that please him. The translations are neither close to the original nor within hailing distance of even third-rate poetry. His own poem, "Ginevra," has all the attributes of stilted prose, and if it were not printed as blank verse, the reader might not suspect it was intended for that. By using paper as thick as grocer's wrapping paper, the publisher has produced a volume nearly two inches thick. One wonders how much longer the British public will put up with book-making of this sort. In America, where the pressure on shelf space in our libraries is becoming acute, publishers aim at proper compactness.

"The Economics of Railway Transport," by Sydney Charles Williams (Macmillan & Co.), is an attempt to emphasize the bearings of economic principles upon the practical business operations of railways. The writer's familiarity with economic theory was obtained largely at Cambridge under Prof. Alfred Marshall, while his knowledge of the actual working of railways has been derived both from a study of the standard works on the subject and as a consequence of his duties as secretary to the agent of the East Indian Railway. The major portion of the volume is divided into two parts, dealing, respectively, with the construction, equipment, and operation of railways, and with the distribution and consumption of "the commodity of transport." As an introduction, however, to the main questions under consideration, there is given a brief historical survey of the evolution of both land and water transportation, and an account of the relation of transportation to the various processes of production, distribution, and consumption. It is somewhat difficult to discover, in Book I, anything of importance which may be characterized as new, for the various chapters deal, in a cursory fashion, with such questions as gauge, alignment, curvature, gradients, size of cars and trains, fluctuations in and classification of freight traffic; all of which subjects are more or less familiar questions even to subordinate officials in the mechanical or operating departments of railways. In Book II, however, the subject-matter is more of an economic than of a mechanical character, and the discussions centre around the very important and highly intricate questions of freight rates and passenger fares. In connection with these, the bearing of economic doctrines upon price determination is well presented. From what already has been said concerning the author, it would be but natural to expect that the illustrations of those principles which are set forth in the text should be taken largely from British and Indian railways, and such is the case. One can scarcely refrain from criticising the writer in his frequent use of foreign words and phrases which, to the great mass of present-day readers of works within the field of transportation, are little more than meaningless. It is also to be regretted that, in many instances, the references have been contained in the text rather than set apart in footnotes.

"Modes and Manners of the Nineteenth Century as Represented in the Pictures and Engravings of the Times" (3 vols., Dutton) is translated from an unspecified original, presumably German, by M. Edwardes. These volumes, covered with gold dotted percale, and provided with numerous color prints, are intended for an honorable place on drawing room tables, and well deserve that dignity. The text, however, is readable and accurate beyond the wont of such compilations, and since not merely pictures—the selection is admirable—and more or less fanciful prints but also actual fashion-plates are generously reproduced, the illustration has documentary worth. These books would neatly beguile a wait for one's hostess, or serve the more serious purpose of suggesting a fancy dress for a costume party.

"The Two Empires, the Church and the

World" (Macmillan) contains lectures given by the late Dr. Brooke Foss Westcott while professor of divinity in Cambridge. They deal principally with the conflict between the church and the empire until the victory of Christianity under Constantine. The concluding chapters set forth in considerable detail Constantine's relation to the church and the work of the Council of Nicæa. The lectures, which were written many years ago, contain little that is novel, and are of no special importance to the historical student, but they are marked throughout by the learning and sound judgment for which the late Bishop of Durham was justly famed, and they will be found interesting and profitable by many readers.

The notable success of the "Dictionary of the Bible" edited by the Rev. James Hastings, and the "Encyclopædia Biblica" of Canon Cheyne, has led to the issue of several smaller works, differing somewhat in point of view. The most recent is "The Temple Dictionary of the Bible" (Dutton), edited by the Rev. W. Ewing, M.A., and the Rev. J. E. H. Thomson, D.D., clergymen who have had the benefit of residence in Palestine. In a large, heavy volume of above 1,000 pages the usual titles in such works are treated succinctly, but with careful scholarship and in good proportion. The writers are conservative, and their purpose is evidently to counteract the influence toward critical positions exercised by the larger dictionaries. Advanced views are stated, but always with argument on the other side. The illustrations, which are numerous, are excellent and convey needed information. On subjects which do not require critical judgment this dictionary is valuable, but for historical study, based on literary appreciation of the documents, it is misleading.

Two volumes of ten hundred and thirty-two pages, nine hundred and five subjects, with two hundred and forty illustrations, and a bibliography equivalent to a small volume, constitute the external features of Dr. S. Seligman's "Der böse Blick" (Berlin: Hermann Barsdorff), a scholarly history of "The Evil Eye," resulting, the distinguished ophthalmologist tells us, from his attempt, twenty years ago in a German high school, to hold forth on "Hypnotism and Mesmerism," when both *Schüler* and manuscript were summarily shown to the door. Not a period in the record of man, or a nook or corner of the globe where darkness has contended with light, appears to have been passed over. Northern, Middle, and Southern America, as well as troubled New England, receive attention that seems adequate, unless it be a mistake to present the Indian, and also the negro in Africa, as believers in the evil effects of vision, and to omit the black man in the United States. The bibliography is effectively divided into seventy-one pages of authorities—a very formidable array—alphabetically arranged, and a special list of authors is quoted after each chapter. The main catalogue includes, among other American writings, the well-known memoir on serpents by Benjamin Smith Barton, so long rightly or wrongly credited with being the first American to graduate from a German university, and who, because of his early residence in Hanover, long ago became known to German scientists.

David Josiah Brewer, an associate justice of the United States Supreme Court, died of apoplexy at his home, in Washington, on Monday night, at the age of seventy-two. He was born in Smyrna, Asia Minor, was graduated at Yale in 1856, and at the Albany Law School in 1858, and began to practise at Leavenworth, Kansas, in the following year. He was a United States commissioner in 1861-62, judge of the probate and criminal courts of Leavenworth County in 1863-64, judge of the district court in 1865-69, county attorney in 1869-70, a justic of the Supreme Court of Kansas in 1870-84, and a judge of the United States Circuit Court in 1884-89, in which year he was appointed an associate of the United States Supreme Court. In 1896 he was a member of the Venezuelan Boundary Commission, and, in 1899, of the British Venezuelan Arbitration Tribunal. His publications include "The Pew to the Pulpit," "The Twentieth Century from Another View Point," "American Citizenship," "The United States a Christian Nation."

Charles Sprague Smith, director of the People's Institute of this city, died early yesterday morning, after a week's illness of pneumonia, at the age of fifty-six. He was born in Andover, Mass., was educated at Amherst College, and also studied at Berlin, Paris, Oxford, and elsewhere in Europe. He was professor of modern languages and foreign literature at Columbia in 1880-91, and a lecturer there after 1887. He organized and became president of the Comparative Literature Society in 1895, and in 1897 had a prominent part in founding the People's Institute, of which he became, and had since been, managing director. He had published "Barbizon Days" and "Working with the People."

Prof. J. P. Shorter of Wilberforce University, a widely known negro educator, died last Friday at Xenia, O.

Kathinka Schücking Sutro, widow of Emil Sutro, died on March 24 at the Hotel San Remo, in New York, at the age of seventy-five. She was born at Osnabruck. She wrote many novels, two of which are: "In Two Hemispheres" and "Dr. Zernowitz." Her novel "Dr. Zernowitz" won a prize offered by the Cincinnati *Volksblatt*. Her father was a judge of the Supreme Court in Germany, and one of her brothers was the poet, Levin Schücking.

Sir Thomas Drew, president of the Royal Institute of Architects of Ireland in 1891-1901, and of the Royal Society of Antiquaries in 1895-97, died recently, at the age of seventy-one. He had done important work in the restoration of the cathedrals of Armagh, Christ Church, and St. Patrick.

James O'Connor, the Nationalist member of Parliament for West Wicklow, an associate of O'Donovan Rossa in the publication of the *Irish People* in 1863, and a participant in the "Fenian Conspiracy" (for which he was sentenced to penal servitude for seven years), died last week at Kingstown, County Dublin, Ireland, at the age of seventy-four.

Dr. Walter A. Copinger, professor and dean of the faculty of law in the Victoria University of Manchester since 1892, died last week at the age of sixty-two. His publications include "Index to Precedents," "An Essay on the Abolition of Capital Punishment," and "Law of Copyright."

Félix Bouvier, the French historian, died recently at the age of fifty-seven. His principal work was entitled "Bonaparte en Italie: 1796."

Baron Joseph Alexander von Helfert, the historian of the Austrian Revolution of 1848, died last week in Vienna at the age of eighty-nine. He is believed to have been the last surviving witness of the ascension of the Emperor Francis Joseph, and was one of the few remaining members of the Diet of that year. He had a prominent part in the political happenings which followed the downfall of the Bach system in 1859, and was conspicuous in conservative Bohemian politics until 1880. He wrote much about various phases of the Austrian revolutionary movement, his more important works including "Geschichte Österreichs vom Ausgang des Wiener Oktoberaufstandes 1848," and "Der Prager Juniaufstand 1848."

Ernst Holzer, an authority on Nietzsche and the poet Schubart, died recently in Vienna at the age of fifty-four.

Oskar Jäger, the German historian and educator, died recently at the age of seventy-nine. He became professor of pedagogics at the University of Bonn in 1901. His many publications include histories of Greece and Rome, and of the Punic Wars; "Wycliffe und seine Bedeutung"; "Weltgeschichte," in four volumes, and a "History of Germany," which was published just before his death.

Adolf Tobler, for forty-two years professor of Romance philology at the University of Berlin, died last week, at the age of seventy-four. He was a native of Hirzel, Canton Zürich, Switzerland, took his doctor's degree at the university there, and then began the study of the Italian and French languages, and in 1867 was appointed to the recently established chair of Romance philology at Berlin. At the time of his death he was preparing a lexicon of Old French. His many publications include "Mitteilungen aus altfranzösischen Handschriften," "Vom französischen Versbau alter und neuer Zeit," and "Vermischte Beiträge zur französischen Grammatik."

Science.

Exercise in Education and Medicine. By R. Tait McKenzie, A.B., M.D., Professor of Physical Education, and Director of the Department, University of Pennsylvania. 8vo. 406 pages. 346 illustrations. Philadelphia: W. B. Saunders Co. $3.50 net.

The author of this attractive volume makes his appeal to a large public—to teachers and physicians, as well as to those professionally concerned with physical training. He takes the ground that the merits of systematized exercise have been obscured by the variety of systems and the one-sided advocacy of them, and particularly by the failure of the medical profession to recognize its true import. The effort to correct all this is not altogether successful because many of his statements, particularly in the first part which deals with healthy persons, lack precision and justification.

In the earlier chapters on the physiol-

ogy of exercise and on massage and passive motion, while much is admirable, there is a good deal of doubtful matter, and the explanation of methods and results is not always sufficient or clear. Too much reliance is placed on the experiments and conclusions of others, taken often at second hand, and these are not noted with sufficient fulness to give the reader a really good foundation. The rest of this part is much better done and is decidedly interesting. Here we have a moderately full but rather uncritical description of exercise by apparatus, and a good account of the systems of physical training which are commonly known as German and Swedish. The incidental sketch of Jahn hardly does justice to his erratic and varied career. Certain other systems are held to be of less importance. The Japanese *jiudo* (or *jiu jitsu*) McKenzie considers to have no permanent influence on training; the methods based on a doctrine of concentration (Sandow and others) have a "tabloid" character of some value but lack the fundamental principle of coördination, and also involve undesirable strains; the Delsarte system has been of service in developing the gospel of relaxation, some of whose advocates, particularly Miss Call, are designated as making real contributions to physical education.

The chapters on playgrounds and municipal gymnasiums, with much text and many pictures, are very suggestive, and those on physical training in schools and colleges are valuable, although rather didactic and not always quite clear; also very interesting are the accounts of what may be done for the blind, the deaf-mute, and the mentally or morally defective in the way of gymnastic exercises.

The second part of the book deals with the application of exercise to pathological conditions. What is said about flat-foot, scoliosis, and obesity is pretty good, and the treatment of the diseases of the circulation is fairly good. Less satisfactory is the consideration of gout, diabetes, and other diseases of nutrition, and the section on hernia is unconvincing. The final chapters on the treatment of nervous diseases, and especially of locomotor ataxia, go also almost too far afield and seem likely to tempt the physical trainer to magnify his office yet more and to undertake too much where often he ought not to interfere at all.

As was to be expected, Dr. McKenzie shows a keen interest in the æsthetics of exercise. Not only is his book very well, even handsomely, printed and remarkably free from misprints, but he has filled it with good illustrations of apparatus, methods, and conditions, of which only a few are perhaps superfluous; but he also reproduces his own figure of the ideal college athlete, unfortunately a little too vaguely printed, and the four faces he has modelled to show types of exertion, fatigue, or exhaustion. The first of these is said to represent violent effort as seen in hammer-throwing, sprinting, or in the spurt of a long race. This apparently needs some qualification, for nearly if not quite the same expression may be seen in much less violent exercise; we have seen it on the serving line in a very ordinary game of tennis played by very ordinary players where the effort was hardly of this class. Evidently individual peculiarities are quite as much in play.

"Air and Health" (E. P. Dutton & Co.), by R. C. Macfie, is a recent volume of the well-known series of popular treatises on medical subjects. Only a small part of the book is given up to the physiology of the respiratory processes. On the whole this is pretty well done, although the writer glides lightly over the essential difficulties of tissue respiration. The rest of the book treats of more purely practical matters in an attractive and instructive way. There are excellent sections on moisture, dust and other impurities of the air, ventilation, and climate, and the discussion of all these subjects is not only fresh, but happily free from dogmatism. The story of the discovery of the composition of the atmosphere from Mayow, here without explanation called Mayou, down to Ramsey is rapidly but well told, and another final chapter presents briefly but clearly the claim of the open-air treatment of consumption and the yet newer claims of the open-air school.

Lieut. Sir Ernest Henry Shackleton, the British Antarctic explorer, who is visiting this country, was awarded a medal by the American Geographical Society, in this city, on Monday evening.

An American experiment station for agricultural research is about to be established at the foot of Mt. Carmel in Palestine, seven miles from Haifa. The aim of its founders, philanthropic Jews of this country, is to put the Jewish colonists and farmers of Palestine in a position to carry on agriculture in a rational and progressive manner. The director, Aaron Aaronsohn, is especially adapted for the position, having spent fourteen years in agricultural and botanical explorations throughout that region, during which he has become deeply impressed with the remarkably close agricultural resemblance between California and Palestine. This new research institution will go far, says David Fairchild of the Department of Agriculture, "towards introducing American methods in the study of agricultural problems throughout the whole Mediterranean region and facilitate the exchange of plant industries between that region and the United States."

Alexander Agassiz, the eminent naturalist and president of the Calumet and Hecla Mining Company, died last Sunday, at the age of seventy-four, on the steamship Adriatic, bound from Southampton for New York. He had been heard from frequently since he went abroad about New Year's, and, so far as his intimates knew, he was in the best of health. He was born in the little city of Neuchâtel, in the Jura Mountains, Switzerland. His father was Louis Agassiz, the naturalist and scientist, and his mother Cécile Braun, sister of Alexander Braun, the famous botanist and philosopher. The young Agassiz's early education was had in Europe; he graduated at Harvard in 1855, and at the Lawrence Scientific School there in 1857, after which he spent three years in the chemical department. He became associated with the United States Coast Survey, in California, in 1859, and in the winter of 1859-60 collected specimens in Panama and Acapulco for the Museum of Comparative Zoölogy at Cambridge. He then studied zoölogy and geology in the Lawrence Scientific School, of which he was appointed assistant in zoölogy. In 1865 he became connected with the Calumet mine, and in 1869 was made president of the Calumet and Hecla Mining Company. He was assistant curator of the museum at Cambridge from 1869 until his father died in 1874, when he became curator. It is estimated that he had given to Harvard more than $1,000,000, mostly in the way of collections and improved equipment, much of which he quietly caused to be installed, and then paid for without mentioning the matter. His publications include "Seaside Studies in Natural History" (with Mrs. Agassiz), "Marine Animals of Massachusetts Bay," "Explorations of Lake Titicaca," "Coral Reefs of Florida," etc.

Prof. J. Rayner Edmands, who for twenty-five years was associated with the observatory staff of Harvard University, died last Saturday at the Johns Hopkins Hospital in Baltimore, at the age of sixty.

James Campbell Brown, professor of chemistry at Liverpool University, died last week at the age of seventy. He took a prominent part in the founding of Liverpool University College, and became professor of chemistry in Liverpool University when that institution was founded. He had published many works on chemistry and chemical research.

Commodore Andreas Peter Hovgaard, the Danish Arctic explorer, died last week at the age of fifty-six. He was a member of Nordenskiöld's expedition of 1878, and in 1882 commanded an expedition bound for the North Pole, and also to search for the Jeannette, but was obliged to winter in the Kara Sea.

Dr. Hans Landolt, professor of chemistry at the University of Berlin from 1891 to 1905, died recently at the age of seventy-eight. Since his twentieth year Dr. Landolt had been engaged in chemical research, especially in the domain of physical chemistry, a branch of science which he did much to develop. Besides many monographs he had published (with Börnstein) "Physikalisch-chemische Tabellen."

Drama.

The production of "The Winter's Tale" in the New Theatre on Monday evening proved to be by far the best Shakespearean performance yet given in that house. In many respects it was the most satisfactory histrionic achievement yet accomplished by the organization. This was due partly to the fact that the piece was given in the so-called Elizabethan fashion, which

permitted most of the text to be spoken in its proper order, making the story more intelligible and maintaining an unbroken interest, but mainly because the acting was generally of a superior character. If none of the male actors was especially brilliant, nearly all were competent, while the principal female parts were in uncommonly strong hands. Miss Edith Wynne Matthison, indeed, as Hermione, and Miss Rose Coghlan as Paulina, easily divided all the chief honors of the evening between them. No finer impersonation of the wronged queen of Leontes than that presented by Miss Matthison has been seen since the days of Helen Faucit. The actress offered a superb picture of outraged womanhood, high courage, lofty scorn, and pathetic endurance, and, at the last, when the death of Mamillius followed the defiance of the oracle, of stony despair. In the statue scene her acting was replete with grace, tenderness, and spiritual beauty. Her diction, as always, was admirable. Miss Coghlan, one of the most accomplished of living actresses, found her great opportunity, of course, in the tirades of Paulina, which she delivered with a steadily increasing vehemence of passion, though never degenerating into rant. No male actor approached either of these ladies in excellence, or in Shakespearean spirit, but Mr. Bruning played Autolycus with abundant vitality, if no very deep insight, and Ferdinand Gottschalk, who appears to have a special faculty for the interpretation of Shakespearean humor, furnished a clever sketch of the country clown. The allegation of the programme that the piece was presented in the manner of Shakespeare's time must not be taken literally. The stage was approximately Shakespearean in design and form, having an inner and outer area, gallery, etc., but in spaciousness and general convenience was far in advance of any Elizabethan structure. Many of the groupings, indeed, with the handsome arras in the background, were pictorial in a high degree. But this only added to the attractiveness of a remarkable performance, which showed, among other things, that spectacular scenery, instead of being beneficial to Shakespeare, is much more likely to be a detrimental incumbrance.

The revival, by Mrs. Fiske, in the Lyceum Theatre, of Ibsen's "The Pillars of Society," will prove interesting, doubtless, to students of the Norwegian dramatist—as a specimen of his work during his transitional period—but can scarcely be regarded now as an event of much dramatic importance. The piece has more of ordinary human feeling and impulse in it, than most of his later social plays, and is not lacking in effective theatrical situation, but it is not a good specimen of his constructive skill, is much over-burdened with insignificant talk and improbable detail, and already begins to show the marks of age very clearly. Its philosophy, founded upon restricted observation, was never profound or universal in its application, while its conclusion is too purely fanciful and theatrical to be impressive. The present representation is of respectable but in no way remarkable quality. Mrs. Fiske is better suited in the part of Lona Hessel than in some others in which she has been seen lately, and Holbrook Blinn plays Bernick with comprehension and force. Sheldon Lewis furnishes a clever character study of the ship carpenter, Aune. Concerning the other players individual comment is unnecessary.

"The Stage History of Shakespeare's King Richard the Third," by Alice I. P. Wood, Ph.D. (Columbia University Press), is a careful compilation of existing material on the subject of the play. Its six chapters treat "Richard the Third in its Relation to Contemporary Plays," "Richard the Third on the Elizabethan Stage," "Richard the Third and the Drama of the Restoration," "The Cibber Version of Richard the Third," "From Garrick to Irving, 1741-1897," and "Richard the Third in America." To these chapters is added a bibliography. Dr. Wood writes intelligently of her material, but hardly makes her own contribution in the discussion as salient as is desirable. Perhaps the most interesting point established by her is the persistent success in the English-speaking world of Colley Cibber's version of the play. It seems a pity that Dr. Wood could not have added to her consideration of the changes in the text made by each of the great actors a larger number of citations shewing the differences in interpretations of the leading part by them. Even as it is, however, the book, for its careful compiling and the many valuable references provided by the copious footnotes, must be useful.

"The White Flame," in four acts, by Luke North (The Golden Press, Los Angeles), is a drama of reincarnation, in which Egyptian mysticism, Buddhism, Brahminism, Pythagoreanism, and modern theosophy are strangely blended. Dealing in semi-serious, idealistic fashion with the fascinating subject of the immortality of the soul, or spirit, it is cleverly written, although it does not suggest any intimate familiarity with ancient speculation on the subject or any special originality of imagination. It does, however, make ingenious use of common ideas and tells an interesting fable. The main thesis seems to be that for each male spirit there is a supplementary female affinity; that these kindred souls—after various reincarnations of disciplinary experience—ultimately may reach a state of spiritual perfection, free from all taint of fleshly grossness, after which they are mutually absorbed into one sexless, immortal, angelic individuality. This is what is supposed to happen in the case of the hero and heroine, who are first introduced as lovers and pupils of a mystical adept in the early days of Egyptian civilization, and then again as guests in a modern mansion, where they recognize each other and renew their former relations, with a supreme indifference to the matrimonial and other obligations incurred before their pre-ordained reunion. Then they part again to die and, in the closing allegorical scene, the shade of their old Egyptian teacher appears to set the seal, as it were, upon the final amalgamation of their now purified souls. This, of course, is a piece of wildly fantastic symbolism, but the play in intent and idea is poetic and inspiring. The affinity of which it treats is intellectual, moral and predestinate. But the author, like many other dreamers, overlooks the fact that in practical operation it would result in the destruction of the present social fabric, unless the pre-ordained affinities were carefully sorted out from the beginning.

Music.

Studies in Musical Education, History, and Æsthetics. Fourth Series. Published by the Music Teachers' National Association. $1.60.

The papers and proceedings of the Music Teachers' National Association at its thirty-first annual meeting, which was held in Evanston, Ill., are presented to the public in this volume of 252 pages. The editor is Waldo S. Pratt of Hartford, Conn., from whom copies may be obtained. As usual, there is a great variety of topics, some theoretical, others practical. The president of the association, Rossetter G. Cole, in discoursing on musicians and musicianship, remarks that one can hardly say whether Wagner's pure musicianship was greater or finer than Beethoven's and Mozart's; but his outlook upon the whole world of art and literary culture was vastly more comprehensive and varied, and this increased his ability to use music as an adequate and effective means of expression. Peter Christian Lutkin calls attention to the great possibilities of sound music-teaching. He is convinced that for every really fine singing voice there are hundreds of other voices which would have been equally fine had the opportunity for development been given them. "The great majority of the human race could sing, and sing well, if proper attention were given at the proper period." Edward Bailey Birge preaches sound doctrine regarding school music. If the children of a school building, from the youngest up, have opportunities often enough of hearing good music well played, we need have no worry, he thinks, about their musical taste later. "The prime requisite in this work is to *listen*, listen again and again, and leave the meaning and form of music to take care of itself." Nine schools in Indianapolis have supplied themselves with "piano-players," in which Mr. Birge has much confidence. Twice a week a recital is given, the titles of the pieces being written on the board. Memory tests are made once a month by playing parts of pieces and letting the pupils write the titles and the names of the composers on paper; and this test they enjoy hugely.

Ernest R. Kroeger gives an amusing account of the diverse "methods" of music-teachers and the uses they make of them to allure students. Arthur Foote descants on the litter of rubbish in books on counterpoint and harmony that has been bequeathed to us from past days, and which we are just begin-

ning to rid ourselves of. He notes that in modern music chords of the ninth are coming to be used with the freedom of sevenths; but real chords of the eleventh and the thirteenth are not easy to find, nor does he think that "we are yet clear in our minds about them." Some musical treasures of the Newberry Library in Chicago are described by William N. C. Carlton, and Albert A. Stanley gives an account of last year's international musical congress in Vienna. Other papers relate to the present status of music in our colleges, while Waldo S. Pratt contributes notes about Practical Church Music, in which, among other things, he considers the three purposes of such music. This ought to interest all church-goers. Opera-goers will be cheered by Karlton Hackett's paper on the Possibilities of Opera in America. The present musical life in Germany forms the subject of a valuable contribution by Adolf Weidig, formerly of the Spiering Quartet. When he was a student, an eminent professor told him that Mendelssohn's music would outlive Wagner's, and in the conservatories even Brahms was tabooed as being too modern. To-day, everybody does honor to Richard Strauss, although, as Mr. Weidig wittily remarks, "his achievements in the field of opera are much more admired for their impossibilities than for their possibilities." Berlin is at present the centre of the musical universe. The number of concerts given there in one season exceeds nine hundred, and there are over ninety newspapers which print musical criticisms. It is for these criticisms that hundreds of young musicians give concerts which cost them much money—usually earned by teaching. Yet the tiny bit of fame thus secured "lasts just about as long as that one edition of the papers in which the criticisms of the concert appear."

In our review of "American Primitive Music" (*Nation*, February 24), we should have corrected the author's assertion that Dr. Theodore Baker is a German. He is an American, and was born in New York.

The latest novelty at the Brussels Opera is a lyric drama in three acts by Pierre de Bréville, a pupil of César Franck, who had previously written incidental music to two plays by Maeterlinck. The name of the new opera is "Eros Vainqueur."

Two hundred years had elapsed on March 12 since the birth of Thomas Augustine Arne. Of him it has been said that he was the most thoroughly national of all English song writers, and that his songs "formed an era in English music." Yet he is now known by a bare handful of tunes, as the London *Times* laments.

Jean Paul ("Harry") Prendiville, a prolific composer and arranger of band and orchestral music, died last Thursday at his home in Worcester, Mass., at the age of sixty-two.

Dr. David Duffie Wood, the blind organist of St. Stephen's Protestant Episcopal Church in Philadelphia, died last Sunday in that city at the age of seventy-two. He had been totally blind since he was three years old. He graduated at the Pennsylvania Institute for the Blind in 1856. His compositions comprised chiefly songs and anthems.

Leopold Demuth, the German baritone singer, died recently at the age of forty-eight. He was a member of the Vienna Hof-opera company, and sang at Bayreuth in 1899.

Art.

PICTURE FRAUDS.

Irrespective of the outcome of the Clausen trial in New York, the plaintiff has done a public service. Believing that false pictures had been sold him, Mr. W. T. Evans appealed to the courts for redress. If collectors generally would follow his example a base traffic would soon be checked. That this kind of courage is exceptional the testimony in the trial shows. Ordinarily, the most that a victimized amateur will do is to demand restitution of his money, sending the fraudulent pictures back to be sold to somebody else. There are a number of dealers who frequently redeem the worse than rubbish they have sold. They can well afford to do so, since for one collector whose suspicions are aroused a hundred remain in complacent possession of their bargains. The result is that thousands of picture forgeries of the ancient schools, and of the French and American schools of the last century, have been distributed. They crowd our collections of the middle class, are bequeathed to widows and children as valuable assets, some even get into public museums.

Such is the result of tolerating the tricky picture-dealer. Meanwhile, the situation is well known. Constantly collections that come into our better auction-rooms are rejected or weeded out for this reason. Whole galleries accepted as collateral have been condemned by experts. Certain dealers frequently take back pictures without challenge or even perfunctory attempt at authentication. These things are notorious. They are talked over where men meet, the names of the dishonest dealers are known, their stalking horses, sometimes men high in financial and artistic circles, operate unrebuked. There seems to be a general assumption of the grotesquely immoral position that a picture dealer may make any misrepresentation or practise downright swindling if only he agrees to pay up whenever he is caught. A gambling hell could not long be run upon those principles, and yet some of our best citizens acquiesce in such systematic and unblushing fraud. Let us for a moment imagine this tolerance extended to any other business—to dry goods, building materials; and we shall not fail to see its preposterousness. Why, the law protects our stomachs, and says that chalk shall not be sold for flour. Do not our eyes deserve an equal consideration? Will decent men in any other business relations admit that sheer swindling calls for no penalty save annulment of the transaction?

We must insist that the evil has grown so great through a deplorable lack of courage on the part of those most nearly concerned. A narrow vanity keeps some lips closed. Mere laziness holds others inactive. A profound selfishness is manifest everywhere. "My money has come back," seems to be the argument, "why should I put myself out to save other men from the thimble-riggers?" That this is poltroonery need not be argued. The decent attitude of a man who has unearthed a den of thieves is not self-congratulation that he may frighten them into giving back his watch, but one of vigilance for the community. Moral indignation should outweigh personal enterprise. An elementary duty, in such a case, is to call for the police and have the gang arrested. To do otherwise would be virtual collusion in thievery. Yet scores of self-respecting and highly esteemed citizens have taken this supine attitude towards flagrant swindling in the picture trade.

What we need is a little elementary moral sense and civic courage. What these picture rogues fear above all things is exposure. In the light of day their traffic cannot live. We honestly believe that a handful of public-spirited collectors could drive the conspicuously fraudulent dealers and intermediaries out of our market. At least the power of the system could be broken and its product degraded to anonymity and the cheap auction-rooms. At present the system does a maximum of harm. Generally speaking, the wealthy collector escapes—to cheat him, or at least to cheat him too often and outrageously, is obviously impolitic. As for the little bargain-hunter, his stake is small; he usually buys without guarantee actual or implied, and is fully able to take care of himself. The burden of dishonest picture-selling falls upon persons of artistic taste and restricted means. Many collectors of this type must keep investment values in view. The auctioneers and the honest picture dealers could tell many a story of sore disappointment when widows or orphans have learned that what was supposed to represent a little competence was actually worthless.

An issue of taste comes to reinforce that of common honesty. It is these collections of middling estate that are setting the artistic standards of the country. From such sources the smaller museums are replenished. Here æsthetic and moral confusion go hand in hand. We know of a collection that was left to a city on condition that a museum should be built to contain it. On ex-

pert scrutiny its renowned examples of the Barbizon school turned out to be specious forgeries. The executor, on learning the truth, merely remarked that to publish it would make trouble, and that in any case the city would get the museum building. Here is the nub of the matter. So long as collectors are willing to stand for false pretences, and to tolerate merchants whose obliquity is notorious, just so long worthless fabrications will mask as masterpieces. The moment our amateurs will deal manfashion with this evil and hale the swindlers to the bar, the whole base traffic will assume its normal artistic and commercial insignificance.

It was the intention of the late Charles T. Yerkes to leave his house and art collection to New York city. Through certain embarrassing conditions of the bequest and subsequent business complications affecting the estate, what was intended for the city is to be dispersed at auction. During the present week the rugs and pictures are being shown at the galleries of the American Art Association. The sale is next week. Mr. Yerkes's old masters are the most important lot that has ever come into an American auction room. In spite of such merely hopeful attributions as Holbein, Dürer, Memling, Luini, Gerard David, Murillo, Ghirlandaio, Botticelli, Verrocchio, the general average is high. Some of the questionable pictures are intrinsically meritorious. The most remarkable groups of individual artists are four Turners, including an exquisite marine in white and darkling blue. Rockets and Blue-lights; four Frans Halses, including a magisterial portrait of an old lady, of his best period, and four Rembrandts, of which the most attractive are an early and highly dramatic Resurrection of Lazarus, and a late and mysterious interior, Philemon and Baucis. In general the representation of the little masters of Holland is strong. Two of the Metsus are superb, Jan Steen's The Siesta is of the finest water, Terborch's The Glass of Lemonade, a characteristic gallant scene, falls by ever so little short of his best. Hobbema and Goyen are well represented. Ruysdael's name is signed—or added?—to an impressive valley scene, which, but for the signature, one would unhesitatingly declare a fine Koninck. There are four interesting Potters, two being sketches, five Ostades, and three De Hoochs, of which one is excellent. The Flemish list begins with several primitive panels intrinsically meritorious, but over-attributed. The Adoration of the Kings by Dirck Bouts alone seems of the first importance. A little Madonna ascribed to Memling is a charming bit of color. A strange History of St. Augustine, attributed to Gerard David, a thinly painted composition with many figures, is closely related to the enigmatic Fountain of Life in the Prado, and like it is probably a Spanish reflection of Flemish art. Four miniature proverbs by old Brueghel illustrate the transitional style of Flanders. Its culmination is shown in Rubens's big mythology, Ixion and Hera, in two Apostles by his hand, and in four Teniers. The Italian pictures are a casually assorted lot. A Madonna with the Young St. John, which bears the great name of Raphael, is closely allied to the Madonna of the Pearl, and is executed with a beautiful preciosity. It is quite as fine as many of the famous Raphaels of European galleries, and, like them, comes from a period when the master was too busy to paint his own pictures. It surely came from his studio, and may have been executed by the talented Penni. A florid but quite magnificent Adoration of the Shepherds, by Baldassare Peruzzi, is a fine specimen of the big altar pieces of the high Renaissance. It should go to a museum. Other Italian pictures of note are an early Andrea Solario, The Annunciation, signed and dated 1506, and a resplendent Coronation of the Virgin, by Andrea Bartoli. The catalogue, in spite of the signature, erroneously ascribes it to Taddeo Bartoli. The panel is a magnificent example of Sienese tempera painting, and obviously a museum piece.

Three miniature portraits on green ground of the Clouet school lead the French contingent. One is ascribed to Holbein against all probability. Then after two centuries come an exquisite Watteau, The Garden Party, and a good Boucher, The Toilet of Venus. Delacroix, the men of 1830, the painters of the Institute follow in the fashion consecrated by a thousand auction sales. We can note only that the pictures are generally of the best, and may specify a finely bleak Rousseau, a Diaz landscape, almost a masterpiece; a Millet nude of the most impressive sort, and his drastic composition, The Pig Killers, a particular favorite of the artist. Corot and Daubigny are represented at their best. A crowded Alma-Tadema, Spring, and two unfinished canvases, very gracious things, by Burne-Jones, for a series illustrating St. George and the Dragon, must close this brief enumeration.

The Yerkes rugs are even more important than the pictures, if rarity be made the measure. There are half a dozen of the so-called Polish-Persian fabrics which, in spite of their excessive scarceness and the beauty of their faded tints, seem inferior to the standard products of the Persian looms. Of these there are about twenty-five of all sizes and degrees of textile fineness. Every one is extraordinary. A tomb rug, otherwise unattractive to the present writer, has no less than seven hundred and fifty hand-tied knots to the square inch. A patchwork of fourteenth and fifteenth century fragments, No. 205, is perhaps the most beautiful and desirable exhibit. A silk rug with floral designs crisply drawn in pale green upon a crimson field is the most gorgeous of them all. A large fragment from a contemporary duplicate of the famous Ardebil carpet, now at the South Kensington Museum, is perhaps the most important number. The greater part of this replica was used to patch out the London example. What is left represents magnificently the force, vitality, and preciousness of decorative draughtsmanship in Persia in its golden age. The catalogue of rugs was prepared by the expert John Kimberly Mumford. His learned and sympathetic work is in rather striking contrast to the careless cataloguing of the pictures. We have no space to dwell upon the miscellaneous objects of art included in this sale. Græco-Roman marbles, and sculpture by Houdon, Falconnet, Rodin, and Macmonnies are perhaps the most striking items.

As an erstwhile enthusiast for the notorious Tiara of Saiterphernes, Salomon Reinach must have taken a peculiar satisfaction in writing the history of the wax bust bought as a Leonardo da Vinci by the Museum of Berlin. The article "Léonard ou Lucas?" is published in the *Revue Archéologique*, 1909, 11, p. 416, and has been reprinted in a pamphlet published by Ernest Leroux, Paris. To the studio of the sculptor Richard Cockle Lucas, according to the testimony of his surviving son, the picture dealer William Buchanan, in 1846 or thereabouts, brought a Leonardesque painting, a Flora, and commissioned Lucas to make a wax figure after that model. To this end young Lucas copied the painting, and the work proceeded, only to be refused by Buchanan. Lucas set it up in his studio, where happily it was photographed about the year 1860. At last it was placed in the porch of a summer house, constructed by Lucas. With the house it was sold. In 1894 our Flora reached the auction room at Southampton, where she constituted the gem of a small collection of busts which was knocked down at five shillings. At a somewhat higher figure Walter Long, of Southampton, bought her, and after several years of vain attempt to realize on his bargain sold her for a song to Messrs. Spink, the well-known London dealers. Here her fame began. Murray Marks recognized her as a Leonardo and acquired her, published her as such, and finally was induced to sell her to Dr. Bode for a matter of £8,000. At this point, A. D. Lucas, who had helped make the bust, and two or three former owners or vendors, who knew its history, communicated their reminiscences to the press. Dr. Bode took refuge in the theory that there had been two busts, one Leonardo's original, which his enterprise had secured for Berlin, another a copy by Lucas which the various witnesses had seen in his studio and elsewhere. Against this hypothesis tells fatally the fact that the photograph of the bust, which was in Lucas's studio in 1860, and whose subsequent history is fully known, agrees in every particular, including the lesions of time, with the bust now in the Kaiser-friedrich Museum. The finding of early Victorian rags and newspapers inside the bust merely confirms the documentary evidence. It should, however, be said in fairness that, in the face of the apparently demonstrative evidence that the Berlin bust is the handiwork of Lucas, certain critics still maintain that it is of the Renaissance and that there has been a substitution which escapes the records. Such impressionistic affirmations seem to us to have no weight against the testimony of Lucas's son, and all the more that we have little authenticated wax sculpture of the Renaissance, by which to substantiate such a faith.

At a meeting of the British School at Athens in February, M. S. Thompson gave an interesting account of the excavation of a prehistoric site near Lianokladhi, in the valley of the Spercheios, in Northern Greece, which he and A. J. B. Ware had examined last summer, and of which no details had yet been published. Three clearly marked strata could be distinguished in the deposit, which probably indicate three distinct settlements, perhaps by peoples of quite different races. The lowest stratum contained neolithic hand-made pottery, with decoration in red on a white ground. This is similar to, though not identical with, pottery found in Thessaly,

Phocis, and Northern Bœotia. The motives of the ornamentation are clearly local, and the technique is peculiar. Apparently, the whole of the vase was first covered with a thick white slip, over which a coat of bright red paint was applied; then the red paint was scraped away with a sharp instrument in broad stripes or zig-zag pattern, so that the white slip appeared below. The second stratum contained pottery, likewise hand-made, entirely covered with a slightly lustrous black or dark-brown paint. A similar fabric has been found in the lowest layers at Orchomenos and in the bottom stratum at Tiryns. Its occurrence as far north as the Spercheios Valley is of great interest. In the third, or uppermost, stratum the excavators found a kind of pottery hitherto unknown, with peculiar geometric designs in black paint. This, too, is handmade. At the same level a prehistoric house of irregular shape was uncovered, with six clay πίθοι still in position. No metal objects were found on the site, but flint implements were found in all three strata.

Tom Browne, the English artist, best known as a comic draughtsman and the editor of *Tom Browne's Annual*, though he had done much creditable work of a serious character in water-color, died last week, at the age of thirty-eight.

Johannes Schilling, the German sculptor, died last week at the age of eighty-one. He was perhaps best known as the sculptor of the national monument, Germania, at Niederwald, though examples of his work are to be found in many German cities, including a colossal group for the façade of the Court Theatre at Dresden. He became blind a few years ago.

Finance.

AN HISTORIC PARALLEL.

On the ninth of the present month, an urgent petition was circulated by members of the London Stock Exchange, asking an extra holiday on Easter Saturday, for the avowed purpose of giving rest to a physically exhausted membership. The Stock Exchange committee granted the petition. The reason for this action was concisely stated in a London financial newspaper, the day after the petition had been presented:

> After the boom in the market, particularly of the last few weeks, four clear days' holiday at Easter would be particularly welcome; indeed, in certain offices closely associated with the "Rubber boom," a holiday threatens soon to become a necessity.

Why should this have been so? During the somewhat prolonged period of inactivity and depression on the New York stock market, the speculative fever in London, described in this column five weeks ago, has raged with increasing violence. This was especially remarkable for two incidental facts—one, that the Bank of England has in the meantime advanced its discount rate because of the weakening of London bank reserves; the other, that the very bank deposits, lent to the Stock Exchange for this speculation, are sure to be called upon peremptorily for other purposes, the moment a budget of taxation passes Parliament and the arrears of taxes, uncollected during the long dispute between the Commons and the Lords, begin to be gathered. To these two considerations, which most people would class as supremely important in an extended speculation, the London speculators have paid no attention. Just what is happening, in the culminating stages of the extraordinary "rubber-share boom" on that market, is thus set forth in the London *Economist* of March 19:

> On Wednesday morning at half-past seven, a jobber lay in his office peacefully snoring, thankful to snatch half an hour's sleep before breakfast after his all-night work, and there he was found by a broker who had been toiling, also through the night, at preparing transfers and casting page after page of accounts in jobbers' ledgers. On the night of the account day itself, of all others, when the over-tired brain begged for rest, in one firm of brokers all the partners had to stay until well past one o'clock in order to reduce the chaos of huge transfer details to manageable proportions. At the Inland Revenue office, in Austin Friars, where transfers are stamped and distributed, such scenes of pressure have never before been witnessed. Long queues of clerks and messengers stretched down the office, and for a hundred yards into the street, waiting for attention.
>
> Queer things happened. One jobber fell momentarily asleep as he stood by the rubber market. Money has been wanted on all sides. Men known to be of considerable wealth have eagerly offered 10 per cent. for contango accommodation. "It isn't enough," commented one dealer to another as the latter bid 10 per cent. on a list of shares he wanted to carry over. . . . A broker had to deliver some six or seven thousand shares in a well-known oil company. For this lot he received more than seventy different names, each representing a different buyer. Among this batch of names was one for a thousand shares; the rest were split up into small lots, averaging less than a hundred shares apiece, the buyers being scattered over all four countries of the British Isles.

To London, this extraordinary spectacle will revive recollections chiefly of the great boom of 1895 in South African mine shares, under circumstances very similar to those of to-day, when values of "Kaffirs" doubled, trebled, and quadrupled in a couple of months, only to be brought to earth again with exceptional violence in the early autumn. But it will not be strange if the description also awakens reminiscence in Wall Street, and the reminiscence is of an occasion which at the time was described as necessarily peculiar to the American markets. It was on April 30, 1901, that 3,200,000 shares were dealt in on the New York Stock Exchange, for the first and only time in the history of that institution. That day had been preceded by five or six days with trading of 2,500,000 or more, and it was followed by three days of 2,800,000 shares each.

The cause of the Stock Exchange demonstration, in the New York of 1901 as in the London of 1910, was a sudden and generally unexpected flaring-up of the most violent speculative excitement on the part of the general public, stimulated by such enormous quantities of capital offered for use to Wall Street borrowers, that the ventures, even of professional speculators, reached a pitch of recklessness. The tales of fortunes suddenly won by waiters, dressmakers, and barbers whipped this public excitement to a frenzy.

As April 1 of that remarkable season drew to a close, it became common talk that the pressure of buying orders for instantaneous execution was such that the Stock Exchange membership could scarcely execute the commissions. Floor brokers on the Stock Exchange were on the verge of nervous prostration, but so were the partners and clerks who had to post the entries. All the rooms at downtown hotels were taken for employees who had to work up to 2 and 3 A. M., and get back to business again at nine. People came downtown to see the tall Wall Street office buildings lighted up on every floor at midnight. Restaurants kept open, and, at the last, cots were spread in the offices for clerks who could not get hotel room, and restaurants were improvised in the customers' rooms.

But this is not the only parallel reminiscence. As London this month asked for an extra holiday for rest, so did Wall Street in 1901. On Monday, May 6, the Stock Exchange members petitioned the governing committee for a full holiday on the following Saturday. On Wednesday, May 8, the governors granted the petition, avowedly to make possible the clearing up of accumulated business, but also to give a rest to shattered nerves. On Thursday, May 9, the structure of stock speculation came down in a memorable crash. But the Stock Exchange had its holiday on Saturday.

There is racy rural humor of a new sort in

SKID PUFFER

A Tale of the Kankakee Swamp

Illustrated by F. T. Richards and Victor Perard. $1.50

The characters are truly American, the incidents are thrilling, and there is a good love story.

"Skid is a genuine creation," says the Chicago *Record-Herald* after reading advance sheets.

Algernon Blackwood's

THE EDUCATION OF UNCLE PAUL

By the author of "John Silence." $1.50.

A seemingly crusty bachelor is led by his nephews and nieces into the world of children's fancy.

This is one of the novels sure to be mentioned among the first dozen in all surveys of current English fiction. *The Spectator* says of it: "Marked by a sense of beauty and a wealth of poetic invention. There is humor. An uncommon book."

MODERN RELIGIOUS PROBLEMS

SIGNIFICANT LITTLE BOOKS

ON A VARIETY OF PRACTICAL TOPICS OF OUR TIME, BY LEADING SCHOLARS OF TO-DAY

Edited by Dr. A. W. VERNON. 50 *cents net a volume.* *Postpaid,* 55 *cents.*

"The series is heartily commended." — *The Independent.*

"We are in hearty sympathy with the aim of the series." —*The Outlook.*

THE VOLUMES WHICH HAVE THUS FAR APPEARED ARE:

THE GOSPEL OF JESUS. By Professor G. W. KNOX, Union Theological Seminary, New York.

SIN AND ITS FORGIVENESS. By President WILLIAM DeW. HYDE, Bowdoin College.

THE FOUNDING OF THE CHURCH. By Professor B. W. BACON, Yale University.

THE HISTORICAL AND RELIGIOUS VALUE OF THE FOURTH GOSPEL. By Professor E. F. SCOTT, Queen's University, Kingston.

THE EARLIEST SOURCES FOR THE LIFE OF JESUS. By Professor F. C. BURKITT, Cambridge University England.

PAUL AND PAULINISM. By Rev. JAMES MOFFATT, D.D., Broughty Ferry, Forfarshire, Scotland.

THE CHURCH AND LABOR. By CHARLES STELZLE, Superintendent of Department of the Church and Labor of the Presbyterian Church of the United States.

TRIBUTES FROM PROMINENT CLERGYMEN

Rev. **George H. Ferris,** D.D., First Baptist Church, Philadelphia:

No greater service could be rendered the religious life of our day than a clear, frank, popular statement of the present condition of theological thought. . . . That you have been able to persuade men so representative to undertake the task is a reason for great congratulation. Your selection of Dr. Vernon to edit the series was most wise. No man in our day, to my mind, is in closer touch with the realm of scholarship and the activities of the church.

Rev. **O. C. Helming,** University Congregational Church, Chicago:

They seem to me to represent the best results of a careful and candid scholarship in remarkably concise, readable and convincing form. . . . The volumes cannot be too highly recommended to thoughtful laymen who are looking for light; and they are precisely what hundreds of ministers and teachers have been waiting for.

Rev. **Philip S. Moxom,** D.D., Springfield, Mass.:

The time is ripe for this frank and strong exposition of modern thought. It will render valuable service to many serious people who have outgrown the traditional theology and have not yet "found themselves" in the new conditions. The publishers are to be heartily congratulated and commended for planning and producing this series. The excellence of the book-making and the moderate price are noteworthy.

Rev. **Edward Lincoln Smith,** D.D., Seattle:

The form in which these little volumes are presented is most attractive. They are easily made companions on a journey, and the clear, sizable type, well-spaced lines, give one a feeling of anticipation in reading them. . . . Both you and the editor have put all Christian people in your debt by this service.

Rev. **Frank W. Hodgdon,** D.D., Plymouth Church, Des Moines:

The name of Ambrose White Vernon as editor assures the public that each volume will combine the best of scholarship with intellectual honesty, devout spiritual purpose and democratic sympathy. Assurance becomes reassurance when one notes the list of authors.

Rev. **Nehemiah Boynton,** D.D., Clinton Avenue Congregational Church, Brooklyn, N. Y.

It is an exceedingly valuable service to put into such definite, concise, plain-spoken words the assured results of modern study and research on the part of our Biblical scholars.

Rev. **Charles L. Noyes,** D.D., Somerville, Mass.:

Such a series of books is most welcome. The need for them is growing more pressing. . . . It is a satisfaction that these volumes are written by men of our own speech, and often of our own country. They are recognized adepts in their fields of exposition, known also for their loyalty and sincere devoutness.

THE CHURCH AND LABOR

has met with much interest in a wide variety of circles, as will be seen from the following:

THE CHURCH

"I have found it a wholesome arraignment of class-consciousness within the Christian Church, and at the same time a sympathetic appreciation of the Church as a social factor."—**Francis G. Peabody,** D.D., Harvard University.

LABOR

"It seems to me that the wide circulation of the book would do much to secure a better understanding of the ethical problems underlying the Church movement and the Labor movement in their related aspects."—**John Mitchell,** formerly president American Federation of Labor.

THE SOCIAL WORKER

"It signifies one of the most vital rapprochements in the moral life of to-day, and it is an important and enduring document in the present-day stage of American history."— **Robert A. Woods,** South End House, Boston.

JUST PUBLISHED
HOLZWARTH. GERMAN LITERATURE, LAND AND PEOPLE
By **Franklin J. Holzwarth**, Ph.D.
Professor of the Germanic Languages and Literatures, Syracuse University.
$1.00.
Shows in a concise manner how German thought and character have developed. Following a description of the early German civilization and history, comes a sketch of the literature, with outlines of the great works. The history and literature of the land are so treated as to show their relation to one another.
AMERICAN BOOK COMPANY
New York Cincinnati Chicago Boston

English Literature
IN ACCOUNT
With Religion
By **Edward M. Chapman.**
Author of "The Dynamic of Christianity."
This unusual book is a study of the debt of English literature, through the past century and a half, to the religious impulse. No serious student of literature can read the book without drawing from it a flood of new light upon the ideals of the nineteenth century, while it has of course special interest for those vitally concerned with religious matters. $2.00 *net*. Postage 17 cents.
HOUGHTON MIFFLIN CO., Boston & New York

Study Book in English Literature
By E. R. HOOKER.
This admirable text covers the ground from Chaucer to the close of the Romantic Period. It is unsurpassed in its fitness both to serve as background for the later study of masterpieces and to give a broad general survey for those who cannot study further.
Cloth. 324 pages. Price, $1.00.

"Studies in Assyriology and Archæology"

"Hilprecht Anniversary Volume"

Published simultaneously in Leipzig, London, Paris, Chicago

Pp. 450, *Royal Octave, Cloth,* $5.00

This book commemorates the twenty-fifth anniversary of the doctorate of Prof. Hermann V. Hilprecht, and the fiftieth anniversary of his birth. In this memorable volume to the man who did so much to enable modern scholars to translate the records of civilization, 2500 B. C., ten nations are represented. They are Austria-Hungary, England, France, Germany, Holland, Italy, Sweden, Switzerland, Turkey, and the United States of America. The book is dedicated to Prof. Hilprecht by "Your colleagues, friends, admirers and collaborators, and the committee."

There are 450 royal octavo pages of letter press contributed by some of the most eminent orientalists in the world.

THE OPEN COURT PUBLISHING COMPANY was founded in 1887, for the purpose of establishing ethics and religion upon a scientific basis. Without animosity to any of the established creeds of the world, it stands for conservative progress based upon the most radical thought and fearless investigation.

THE PRIMARY MEANS adopted by *THE OPEN COURT* for the promotion of its principles, is the publication of standard classical literature, and of original books by competent writers.

THE SECONDARY MEANS is the publication of two periodicals, entitled *THE MONIST*, a quarterly magazine devoted to the philosophy of science, and *THE OPEN COURT*, an illustrated monthly, devoted to the science of religion, the religion of science, and the extension of the Religious Parliament idea.

Complete files of *THE OPEN COURT* and *THE MONIST* are obtainable at most public libraries in large cities. A limited number of complete files are still on sale, and single copies of back numbers may be obtained upon request.

THE MONIST, $2.00 the year, single copies 60 cents.
THE OPEN COURT, $1.00 the year, single copies 10 cents.

NEW BOOKS OF ESPECIAL INTEREST TO LIBRARIES PUBLISHED BY

D. APPLETON & COMPANY

29-35 West 32nd Street, New York City.

To be Published April 22

THE AMERICAN PUBLIC LIBRARY

By ARTHUR E. BOSTWICK, Ph.D.

Librarian St. Louis Public Library, Late Librarian New York Free Circulating Library and Brooklyn Public Library, etc.; President American Library Association, 1907-08.

For the general reader, for the librarian, who will find in it a grouping of facts and a mode of treatment that may be suggestive and interesting; for the young library assistant, and for the student in library school or training class, who will find in it, not an exhaustive treatise on library economy, but rather a bird's-eye view of the subject.

Illustrated. 12mo, cloth. $1.50 net.

A History of the People of the United States VOLUME VII

By JOHN BACH McMASTER, Ph.D., Professor of American History, University of Pennsylvania. This volume brings the history down to 1852, telling of one of the most vital periods in the history of the country. To be complete in eight volumes.

Illustrated. 8vo, cloth, per volume, $2.50 net.

The Southern South *April*

By ALBERT BUSHNELL HART, Ph.D., LL.D., Professor of History at Harvard University. A careful, accurate consideration of the condition of our Southern States four decades after the close of the war between the States, with philosophical conclusions which the author has arrived at as to the outlook for the future in commerce, agriculture, and sociological conditions. 12mo, cloth, $1.50 net.

The American Hope *April*

By WILLIAM MORSE COLE, Assistant Professor of Accounting in Harvard University. An attempt to look beyond the unfavorable symptoms of American life, to show the rational point of view toward American conditions.

8vo, cloth, gilt top, rough-cut edges, $1.50 net.

Descriptive Meteorology *April*

By WILLIS L. MOORE, Chief U. S. Weather Bureau. A book that brings the essentials of meteorology up to date, in an available form. Chapter IX is of especial interest to aviators.

Many maps and illustrations. 8vo, cloth, $3.00 net.

The Big Game of Africa *Late Spring*

By RICHARD TJÄDER. This book differs from other books describing hunting for big game in Africa, inasmuch as it has a scientific basis and deals very fully with all of the requirements for such an expedition. A unique feature is a chapter treating of the contributions to museums resulting from these explorations. Illustrated with 32 pages of photographs taken by the author.

8vo, decorated cloth cover, $3.00 net.

The Conquest of Disease through Animal Experimentation

By JAMES P. WARBASSE, M.D., author of "Medical Sociology." The relations of human life to the lower animals from the aspect of biology, with special reference to the intertransmissibility of diseases and the methods of study applied to their prevention and cure. Large 12mo, cloth, $1.00 net.

Travel and Sport in Turkestan

By Captain J. N. PRICE WOOD. 100 Illustrations from original photographs and an itemized expense-account of the journey. 8vo, cloth, handsomely bound and printed. $3.50 special net.

Queen Christina of Sweden

By I. A. TAYLOR. Author of "Lady Jane Grey and her Times." Photogravure frontispiece and 16 other beautiful portraits. 8vo, cloth, gilt top, rough-cut edges. $4.00 special net.

The Reconstruction of the English Church *Late Spring*

By R. G. USHER, Ph.D., Instructor in History, Washington University. This book traces the development and reconstruction of the English Church from the days of Richard Bancroft, whose life it narrates.

8vo, cloth, gilt top, rough-cut edges, 2 vols., $6.00 net.

An Admiral's Log

By Rear-Admiral ROBLEY D. EVANS, U. S. N., (retired.) This volume begins where his "A Sailor's Log" stopped, and tells the story of his eventful career down to the present time.

Illustrated from photographs. Cloth, 8vo, $2.00 net.

The Psychology of Reasoning *Late Spring*

By Professor W. B. PILLSBURY, University of Michigan. An effort to determine the ways in which reasoning has grown and to discuss the uses that have been made of the materials in reasoning.

Large 12mo, gilt top, rough-cut edges, $1.50 net.

Aërial Navigation *Late Spring*

By ALFRED F. ZAHM, M.E., Ph.D., Professor of Theoretical and Applied Mechanics, Catholic University of America. A comprehensive history of aëronautics from military, recreative, and scientific points of view, from the earliest dreams of wings and flying machines to the present perfection of practical aircraft. With many illustrations from photographs and diagrams. Decorated cloth cover, demy 8vo, $3.00 net.

Up the Orinoco and Down the Magdalena *April*

By H. J. MOZANS. In this book the author relates his travels to South American countries and across the Andes under unique and unusual conditions, travelling mostly on foot or with pack mule, and frequenting unknown and little visited places. Illustrated with 16 half-tones, 8vo, gilt top, rough-cut edges. $3.00 net.

George Grenfell and the Congo

By Sir HARRY JOHNSTON, G.C.M.G., K.C.B., Hon.D.Sc. A history and description of the Congo Independent State and Adjoining Districts of Congoland, together with some account of the Native Peoples and their Languages, the Fauna and Flora; and similar notes on the Cameroons and the Island of Fernando Po. In two volumes, royal 8vo, cloth gilt and gilt top. With 496 Illustrations from photographs. $7.50 special net.

The Drama of St. Helena

By PAUL FRÉMEAUX. The story of the last days of Napoleon has never been more graphically told than in this book. 8vo, cloth, 27 unusual illustrations. $3.00 special net.

The Real Francis Joseph:

THE PRIVATE LIFE OF THE EMPEROR OF AUSTRIA.

By HENRI DE WEINDEL, English version by *PHILIP W. SERGEANT.* Photogravure frontispiece and 40 other portraits and illustrations.

8vo, cloth, $4.00 special net.

A GROUP OF INTERESTING BOOKS

READY IN MAY.

ABRAHAM LINCOLN.

THE TRIBUTE OF A CENTURY, 1809-1909.

Commemorative of the Lincoln Centenary and Containing the Principal Speeches made in connection therewith.

Edited by NATHAN WILLIAM McCHESNEY.

This book should be in possession of every American family, and in every collection of Lincolniana. In the compass of 600 pages it presents the most noteworthy of the many addresses made by prominent men at the great centenary celebration held throughout the country February, 1909. These present the great emancipator from every possible point of view, and offer estimates of Lincoln's life, character, and influences of the greatest value. This is altogether different from any previous Lincoln book.

With over 50 illustrations. Cr. 8vo. $2.75 net.

LINCOLN: An Address.

By ISAAC NEWTON PHILLIPS.

This little book is an analysis by a man who has studied Lincoln's career with a view of finding an explanation for it. The author makes clear that the great lesson of Lincoln's life was *patience.*

"Well and convincingly written and breathing a spirit of intense admiration and lofty appreciation."—*New York American.*

With frontispiece. Novelty binding, 16mo. $1.00 net.

IN PRESS.

THE DIARY OF JAMES K. POLK.

Edited by MILO MILTON QUAIFE.

The original diary kept by James K. Polk during the years of his Presidency is here reprinted complete, word-for-word, and for the first time. The manuscript is in possession of the Chicago Historical Society, and has occasionally been used as a source for critical historical work, but its great value as a document in American history has hardly been realized. Every historical society and every library should obtain this important set.

Four volumes, each with photogravure frontispiece. Cr. 8vo. $20.00 net.

THE FIRST GREAT CANADIAN.

The Story of Pierre Le Moyne, Sieur d'Iberville

By CHARLES B. REED.

Pierre Le Moyne was not only the most picturesque figure of the days of French supremacy in America, but he was perhaps the most gifted constructive statesman of his day. Dr. Reed writes with spirit and narrative ability, as well as with accuracy on Le Moyne's great achievements.

Illustrated from rare prints. Cr. 8vo. $2.00 net.

A WOMAN'S IMPRESSIONS OF THE PHILIPPINES.

By MARY H. FEE.

This is a chatty and entertaining account of things as they are in the Philippines, written after a somewhat extended and unique experience as a school teacher in the islands. Miss Fee sees, however, beneath the surface, and among the delightfully drawn pictures of Philippine life which she gives, are some remarkably keen observations of American difficulties in dealing with the Filipinos.

Illustrated, 8vo. $1.75 net.

Letters and Memorials

OF

Wendell Phillips Garrison

Editor of The Nation 1865–1906

In one volume, crown 8vo, 300 pages, with photogravure portrait.

During the forty-one years in which he edited the *Nation*, with a thoroughness, ability, and conscientious devotion unsurpassed in the records of American journalism, Mr. Garrison was an indefatigable correspondent, never employing an amanuensis, but writing tens of thousands of letters with his own hand to his contributors, who embraced practically all the leading American scholars and critics of the period. From a dozen groups of these, which have been kindly loaned by the recipients, a sufficient number of selections has been made to illustrate the relations between Mr. Garrison and his great corps of contributors, the frankness and tact which he exercised towards them, and the wide range of his interests, tastes, and sympathies. The volume also contains a brief sketch of his life, a dozen of his best poems, and several of his characteristic editorials, reviews, and essays, besides a fine photogravure portrait. It likewise preserves the notable letter of appreciation addressed to Mr. Garrison by more than two hundred contributors to the *Nation* on the completion of his fortieth year of service, and his acknowledgment thereof.

Houghton Mifflin Company

BOSTON NEW YORK

Manet

And the French Impressionists

By THEODORE DURET

A history of Manet, who is usually held to have been the founder of the French Impressionistic School of Art, and his followers in France: Pissarro, Claude Monet, Sisley, Renoir, Berthe Morisot, Cézanne, and Guillaumin.

Illustrated with four etchings, four wood engravings, and 32 half-tone reproductions. Small quarto. Cloth, with gilt, $3.75 net.

Indoor Gardening

By EBEN E. REXFORD

Author of "Four Seasons in the Garden," etc.

Here the amateur gardener will learn much concerning the different kinds of flowers, their care and development, something of soils, window and veranda gardens, pots, drainage, fertilizers, insects, seedlings, bulbs, decorations, the implements required, etc.

Colored frontispiece and 32 illustrations. Decorated title-page and lining-papers. Crown 8vo. Ornamental Cloth, $1.50 net.

The Complete Story of LIEUT. SIR ERNEST H. SHACKLETON'S Antarctic Expedition

The Heart of the Antarctic

"The most interesting, thrilling, and instructive narrative of polar exploration ever put before the public."—*Boston Evening Transcript.*

12 color plates, 3 maps, and over 300 illustrations from photographs. Royal octavo. Two vols. Cloth $10.00 net.

The Heart of Desire

By ELIZABETH DEJEANS

Author of "The Winning Chance."

A thoroughly modern story, with a California setting, dealing with people and circumstances that develop naturally in our prosperous, highly-strung life of to-day. We are given a glimpse into the innermost sanctuary of a woman's soul—a revelation of the truth that to a woman there may be a greater thing than the love of a man. The plot is intensely dramatic and appealing, is handled with splendid skill, and will touch the sympathy and arouse the instant interest of every reader.

Three Illustrations in colors by The Kinneys. 12mo. Decorated cloth, $1.50.

Routledge Rides Alone

By WILL L. COMFORT

A consistently strong novel, dramatic, well written, and full of fire and intrigue. Mr. Comfort has drawn upon two practically new story places in the world of fiction to furnish the scenes for his narrative—India, and Manchuria at the time of the Russo-Japanese War. While the novel is distinguished by its clear and vigorous war scenes, the fine and sweet romance of the love of the hero, Routledge—a brave, strange and talented American — for the "most beautiful woman in London," rivals these in interest.

Colored frontisplece by Martin Justice.

12mo. Cloth, with colored luset, $1.50.

Raleigh

A Romance of Elizabeth's Court

By STEPHEN LOVELL and WM. DEVEREUX.

A bright, readable, highly dramatic novel, founded upon the play "Sir Walter Raleigh," in which Mr. Lewis Waller recently scored such a big success in London, and which he will probably produce in this country this fall.

Illustrated with photogruphs of scenes from the play. 12mo. Decorated cloth, $1.50.

Hunting in British East Africa

By PERCY C. MADEIRA

A full account of a successful hunt, taken by the author, during the winter of 1907-08, over much the same country Mr. Roosevelt has been covering.

Illustrated with 129 plates from photographs and two maps. Large octavo. Cloth, gilt top, $5.00 net.

Robert Hichens's Bella Donna

is the Talk of the Country

FIFTH LARGE PRINTING

THE NUCLEUS OF EVERY LIBRARY SHOULD BE

Lippincott's New Gazetteer

Edited by Angelo Heilprin and Louis Heilprin.

"A work of such thorough execution and admirable plan as to leave no room for adverse criticisms."—The *Dial.*

Over 2,000 pages. Quarto. Sheep, $10.00 net; half Russia, $12.50 net; patent index, 50 cents extra.

Allibone's Dictionary of Authors

With Supplement.

By John Foster Kirk, LL.D.

The only work of its kind, and contains a perfect mine of information about books and their authors.

Five volumes. Imperial octavo. Per set, cloth, $17.50; half morocco, $37.50.

Chambers's Cyclopaedia of English Literature

New Edition.

A clear and comprehensive survey of English literature from its beginning to the twentieth century.

Three volumes. 2,500 pages. Imperial Octavo. Cloth, $12.00 net per set.

LIPPINCOTT'S UNIVERSAL

Pronouncing Dictionary of Biography and Mythology

This magnificent work has lately undergone an extensive revision.

One volume, Sheep, $8.00 net; half morocco, $10.00 net. Also a subscription edition in two large octavo volumes.

J. B. LIPPINCOTT COMPANY

PUBLISHERS PHILADELPHIA

IMPORTANT NEW MACMILLAN BOOKS

Mr. Winston Churchill's *new novel*

A Modern Chronicle

"There is no doubt of this novel's brilliance and bigness. The book is literature, and it will be so adjudged by readers of widely differing literary tastes and ethical inclinations."
—*Chicago Record-Herald.*

Illustrated with many drawings. Cloth, $1.50.

Dr. Henry van Dyke's *new book*
The Spirit of America
"As valuable for its inspiration as it is delightful in tone and keen in insight."—*Press.*
Cloth, $1.50 net; by mail, $1.61.

STORIES FROM AMERICAN HISTORY

Frederic L. Paxson's *new book*
The Last American Frontier
Flooded with the human interest of the overland mail, the engineer's construction camps, and other forces wiping out the frontier.

John R. Spears's *new book*
The American Merchant Marine
The romance of the adventurous men who carried the flag of American commerce into every port of the seven seas.

H. Addington Bruce's *new book*
Daniel Boone and the Wilderness Road
Like the above, a record of romance and adventure, none the less exciting for being true.
In press

Each volume, illustrated. Cloth, $1.50 net; by mail, $1.62.

Charles G. D. Roberts's
Kings in Exile
Stories of animals, and of the way in which the instincts of their native wild are betrayed even in captivity.
Cloth, illus., $1.50.

Jack London's *essays on*
Revolution
Papers expressing the radical social views matured through unusual experiences.
Ready next week.

Mr. Francis L. Wellman's
Day in Court
is a capital book from which to learn the subtle arts of great advocates in estimating and handling men.
Cloth, $2.00; by mail, $2.18.

Mr. Herbert Croly's
The Promise of American Life
"One of the most truly notable books of the season . . . on pressing and vital problems."—*Record-Herald,* Chicago.
Cloth, $2.00; by mail, $2.14.

NEW OUT-DOOR BOOKS

L. H. Bailey's *new*
Manual of Gardening
A practical handbook for any who wish to have attractive home grounds or to grow flowers, fruit, or vegetables for home use.
Cloth, $2.00 net; by mail, $2.12.

Dr. John McLennan's *new*
Manual of Practical Farming
A book for the man who feels the need of getting all the profit possible out of a small farm with the least expense.
Cloth, illus. Ready Apr. 20.

Dr. D. E. Lyon's
How to Keep Bees for Profit
In Press.

C. S. Valentine's
How to Keep Hens for Profit
Ready Shortly.

Books which have an intimate relation to "the cost of living."

Wm. Vaughn Moody's
The Faith Healer
The new play by the author of "The Great Divide."
Cloth, $1.25 net; by mail, $1.35.

Dr. Ray M. McConnell's
The Duty of Altruism
An interesting search for the basis of the obligation to be just rather than selfish.
Cloth, $1.50 net; by mail, $1.61.

Dr. Andrew M. Fairbairn's
Studies in Theology and Religion
A most notable study of the church as called to create a new order in years.
Cloth, 8vo. $3.50 net.

Dr. Henry C. King's
The Ethics of Jesus
A systematic study of the teaching of Jesus as to man's power to live the life of love or of selfishness.
Cloth, $1.50 net; by mail, $1.60.

The Economics of Railway Transport
By SYDNEY CHARLES WILLIAMS, B.A., Sec'y to the Agent, East Indian Railway
Manchester Guardian: "This book should prove most useful, both to the student and the railway man."
Indian and Eastern Engineer: "Mr. Williams's book should be read with interest and profit by a wide circle of railway men."
Cr. 8vo., $1.25 net; by mail, $1.35.

OTHER NEW MACMILLAN NOVELS

Mrs. Voynich's *new novel*
An Interrupted Friendship
There is no more poignantly interesting character in fiction than the unforgettable "Gadfly," who dominates a part of this book.
Cloth, $1.50.

Mary S. Watts's
Nathan Burke
Leisurely, delightful, thorough as Thackeray, sunny as its own Ohio scenes.
Cloth, $1.50.

Gertrude Atherton's *new novel*
Tower of Ivory
"It possesses the great and unusual merit of interest."—*New York Herald.*
Cloth, $1.50.

Mr. F. Marion Crawford's
An Undesirable Governess
Inimitably humorous in a quiet, delightful way is this the last unprinted piece of fiction by the author of "Saracinesca."
Cloth, $1.50.

Published by THE MACMILLAN COMPANY 64-66 Fifth Ave. N. Y.

The Nation.

NEW YORK, THURSDAY, APRIL 7, 1910.

The Week.

The oratorical campaign to be undertaken on behalf of the Administration will begin on Saturday with a tremendous outburst of speaking. Mr. Taft is to lead off in Washington, and Mr. Wickersham in Chicago. It is to be words, not deeds, from now on to drown the muck-rakers and malcontents, for the Administration has discovered that these criticisms are making headway. So a lot of facts about the favorable working of the Payne-Aldrich tariff are to be shaken out of elaborate sleeves, and an "aggressive note will be sounded." It has even been hinted that the Cabinet will be strengthened by the resignation of Mr. MacVeagh, his successor to be a real Republican and skilful politician, who will direct the war-fare. This sounds promising. But as the public is talked at to accept the Taft Administration at its own valuation, will not the question naturally arise whether this sudden flurry of self-defence is not a confession of weakness, and whether it is not in some way connected with the arrival in Europe of the ex-President of the United States?

The *Commoner* congratulates the country and itself on the growing popularity of Democratic dinners, and begs to recommend the festal meal as the most appropriate way of honoring the memory of Jefferson next week. "At this moment," it says, "when the principles of Jefferson are boldly assailed by the dominant party, it would be well if in every precinct throughout this country men could gather, not merely for the purpose of paying tribute to an individual named Jefferson, but for the more important business of holding aloft the banners upon which are inscribed the principles to which this nation owes its birth and to which it will owe its preservation." Holding aloft the banner between the oysters and the soup may appear, at first sight, a rather tedious performance; but in the long winter of discontent that has surrounded the Democracy, it needs a little solid food to keep up the thinnest amount of courage. Shut out for so long from the public crib, the Democracy has had the hard choice of starving or of paying for its own dinner. It is by no means a valueless habit in a great political party to practise paying one's way as one goes along. Let us hope that when the Democracy does finally win its way towards the public fleshpots, it will come, not ravening for all it may devour, but faithful to the habit of self-support it has acquired in the lean years.

We are glad to record Mr. Taft's manly stand before representatives of union labor and his good word for non-union labor—that is, for the inalienable right of the American workingman to accept employment where he pleases, when he pleases, and at what wages he sees fit to take. America's worst enemy could wish her nothing more crippling than that the trade unions should absolutely dominate the labor market. They have virtually been doing that for years in England, and more than one student of her present industrial difficulties attributes them in considerable degree to this fact. Mr. Taft, like many another, recognizes clearly that labor unions have achieved much that is good; that they have their praiseworthy sides. He thinks them absolutely necessary, too, in order to combat capitalistic organizations. But to turn over to them the destinies of every worker and every industry—that, if we properly read his words, is something unthinkable. We are only sorry that when he had the trainmen before him he did not dwell upon the evil resulting to railways and the public safety from many of their present rules and regulations and from their assumption of authority. Probably Mr. Taft has been too busy of late to read the "Confessions of a Railway Signalman," wherein some of these facts are set forth by a union man.

"Dr. Eliot's dream" is one characterization of the plan urged upon President Taft at the White House last week by Dr. Charles W. Eliot of placing all postal employees in fourth-class offices under the civil-service rules. Well, wilder dreams than this were dreamed by the original civil-service reformers, and all came true. To-day, these fourth-class postmasters are a source of endless political strife; they are the links in many an important machine to defeat the will of the people. Upon this sort of patronage many a politician waxes powerful. Congressmen are overburdened with this sort of office-broking, and that the President should have to appoint each one is an absurdity. Good business and sound political reasons dictate the change, and President Taft should jump at the chance. He ought to do something to make his Administration distinguished—it needs plenty of bolstering up. Every President of late years has advanced the cause of civil-service reform. If he takes the advice of the Civil-Service Reform Association, he will merit the gratitude of the country; that he will thereby weaken the political machine which forced his nomination upon the country, is merely another reason for the proposed reform.

We cannot feel too grateful to Theodore Roosevelt for his thoughtfulness in advising the American people how to think about this dreadful catastrophe in Rome. There would have been Orange riots in the streets of New York to-day and the burning of a Catholic church or two in Kansas, if this calm, manly, high-minded telegram from Rome had not appeared simultaneously with the shocking news that the Pope and Mr. Roosevelt will not meet. But we are sorry for the Pope. He will miss the grasp of the mighty hunter's hand and the assurance from his own lips that he *did* visit every Catholic mission within reach just as he visited the Protestant missions; that, on the one hand, he loves his Catholic fellow-citizens, and, on the other, he loves the Protestant and Hebrew fellow-citizens just as much. Later on, we are sure, when the Pope reads this magnanimous telegram, he will repent in sackcloth and ashes. As for the American public, it will never forget that Mr. Roosevelt prevented an outraged Protestant country from rising in its wrath and beginning a religious warfare. All our people will to-day speak kindly to their Catholic friends, as he wishes, and put their revolvers back into their holsters.

The Federal Government's "raid" on

the bucket-shops, though based apparently on the fact that the enterprises attacked had been doing business in the District of Columbia, is part of an effort by the public authorities generally to stamp out a peculiarly noxious abuse. What, by some peculiar and not wholly obvious analogy of thought, our people call a bucket-shop, is not only a gambling establishment pure and simple, but is in most cases a gambling establishment which pretends to be something else. The purchases or sales of stocks, made by customers of these concerns, profess to be transactions on a margin, conducted in part with borrowed money, like operations on the Stock Exchange. The Stock Exchange requires that its members actually execute such buying or selling orders on the exchange, and severely punishes brokers who fail to do so. The bucket-shop makes no legitimate sale or purchase whatever. Not only so, but, in the language of Wall Street, it frequently "coppers" its customers by secret transactions of its own. If those customers happen to have guessed rightly in their attempts at speculation, the bucket-shop has been known to trade in a large way on the Stock Exchange, on its own account, with a view to forcing the movement of prices against its patrons. Its activities are, therefore, not merely fraudulent in character, but are of the nature of conspiracy against the people whose money and patronage it has solicited. It is on this ground that the Government is acting for the protection of its citizens.

It is the irony of fate that public dissatisfaction with Republican policies should be visited on the innocent or the comparatively innocent. Indiana, Iowa, and Minnesota are hotbeds of "insurgency," and their representatives in Congress have assailed the tariff iniquity as sharply as any Democrat. Yet it is insurgents like Beveridge of Indiana who are now threatened by the very anti-tariff sentiment which they share. Were the issue of Beveridge's reëlection to the Senate one to be decided within the Republican party there would be no doubt as to its outcome. But, unfortunately, in the autumn elections for the Indiana Legislature, the campaign will be fought out as between Democrats and Republicans without regard to stand-pat and insurgent variations among the latter, and Beveridge may have to pay for a tariff bill which he voted against, but which his party nevertheless saddled upon the country. To endorse or not to endorse, that is the question which the framers of Republican State platforms are now bound to take up with regard to the tariff; and the choice is a difficult one at best. Standing by the tariff may mean the loss of an election. Evading or condemning the tariff will be interpreted only as a confession of Republican guilt, and lead to the same result. It is a situation distinctly encouraging to Democrats.

Representative Slayden has acted promptly on one military abuse—the flagrant violation of the Constitution by three United States officers detailed to the Cuban army. The Constitution says that "no person holding any office of profit or trust under them [the United States] shall without the consent of the Congress accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign State." Yet Capts. Frank Parker, Eleventh Cavalry; G. G. Gatley, Third Field Artillery, and P. S. Golderman of the Coast Artillery are receiving pay from the Cuban Government, as well as from their own. That the War Department admits the impropriety of this appears from Secretary Dickinson's annual report. It further concedes the illegality of the situation, because a rider has been attached to the Military Academy bill, authorizing the lending of officers to Cuba and Panama on the request of the Presidents of those republics. In other words, it asks approval for a wanton violation of the Constitution which has been going on openly for about a year. Why should American officers get double pay for serving in Cuba? That is the real question. The Army of Occupation, under Gen. Barry, did not receive double pay. This is what makes the army think the whole business merely a piece of favoritism.

Pittsburgh's indicted bribe-takers and bribe-givers are fighting desperately after the manner of their kind. In their behalf counsel moved last Monday for a quashing of the charges on the ground that one of the grand jurors concerned in framing the indictment was a non-resident of Allegheny County. And again counsel asked for a change of venue, on the ground that public sentiment was inflamed against his clients, and he read from newspapers in support of his contention. At bottom, there is no question here of the accused desiring justice. It is a question of escaping punishment by hook or crook. It is to be hoped that the Pittsburgh courts will see fit to proceed with the trial at once. The plea for a change of venue is frequently made and seldom granted nowadays. Judges have been ready to recognize that under modern conditions of publicity it is ridiculous to expect that the public shall remain quiet where the situation calls for strong feeling. It is as absurd as that other popular method of picking out jurymen who have neither read nor discussed the sensation that the very children in the cradle are prattling about. A jury of men possessed with a deep horror of graft is not at all a bad jury to sit in a graft trial.

One aspect of such revelations of widespread corruption as are now filling the newspapers is little thought of, and yet it is perhaps, in its material effects, the most important of all. Take the Pittsburgh case. Here we have city councilmen, or former city councilmen, coming in, by droves, to confess that they have taken bribes. One has taken money for a street ordinance, one for a bank ordinance, and so on. No doubt the moral aspect of this state of things is the most serious and the most intolerable. But consider also what paralysis of the true functions of a Legislature or a city council it signifies! Can the man whose eye is on the chance to make a hundred dollars here and five hundred there by selling his vote have his mind on the public interests? If American cities and States have been flagrantly improvident and neglectful, if they have allowed the superiority of our situation to that of the Old World to count for so little, if they have let Hamburg and Berlin do things that Philadelphia and New York might have done ten times more readily, but have not done —how much of this is due to the fact that our city and State legislation has been in the hands of grafters or semi-grafters? The cost of the graft system in the way of direct harm by illegitimate means is as nothing in comparison with these indirect results.

It will be with a sense of personal loss that the news of Myra Kelly's death will be heard by many thousands whom she has delighted and touched by her unique stories of the East Side. In that remarkable output of short stories of high merit and distinctive quality which, for a series of years, formed so notable a feature in our magazine literature, the work of Myra Kelly was clearly differentiated from that of any other writer. Underneath the tricks of East Side Jewish English, and underneath the sustained grotesqueness of character or sentiment or thought displayed by the leading figures in the stories, there ran, all along, a genuine human quality that gave to the whole a place quite other than that which a first glance at the stories would suggest. Not only did Miss Kelly convey a tender sympathy with the little people she portrayed; she made us share with her a feeling for their high qualities of loyalty and aspiration that could have in it nothing of condescension or patronage. By what simple but subtle art she contrived to make such a feeling compatible with whole-hearted laughter at the surprising incongruities and absurdities she was constantly picturing, or even caricaturing, it would be difficult to say; but the effect was there. And the tenderness of feeling she inspired for her little protégés overflowed in her own favor; and many a heart that has been moved by her tales of "Teacher's" adoring pupils will be saddened by the thought that her own fresh young voice is silent.

As though every nation under the sun were not supplied with more than a sufficient quota of war maniacs—jingo politicians, jingo editors, patriotic powder and ammunition salesmen, preachers of race hatred, and ordinary fools whose habit is to cry out aloud for battleships, God, and country—it must needs go searching for additional aid and comfort among the most eminent foreign specialists in blood and thunder. France, as a nation rich in high-powered speculators on world-politics, has been peculiarly active in foreseeing war between the United States and Japan. The latest prophet from Paris is Vice-Admiral Fournier, whose new book fairly palpitates with horror at the imminent danger of a terrible conflict between the two peoples, who are now "actually face to face in the Pacific." Admiral Fournier is a fellow-countryman of the expert who some time ago had a number of Japanese torpedo-boats make a dash from Yokohama and destroy the American battleship fleet off the coast of Brazil. He recalls, too, that other expert, a German, who represents an American army as landing at Corpus Christi, Texas, in order to take in flank a Japanese army encamped in the neighborhood of Butte, Montana. We greatly fear that if Admiral Fournier, who sees the Japanese and Americans face to face across twelve thousand miles of the Pacific, were to be landed in New York, he would be sauntering out from his hotel the next morning to look for the famous *Peaux-Rouges* who hunt the buffalo in the borough of the Bronx.

If Berlin continues to grow at the present rate it will have 6,450,000 inhabitants in 1950 and 10,000,000 in 2000. Some years ago the local architects looked the situation squarely in the face and concluded that it was sheer folly to let the city keep on growing at random, by the mechanical process of adding one street to another. There should be some general plan, they insisted, in accordance with which the city should be enlarged, a plan which would take into consideration hygienic problems, rapidity and convenience of transportation, and the preservation, as far as possible, of scenic features. Several prizes of from 15,000 to 25,000 marks for the best plans were accordingly offered, and the winners were Professors Genzmer, Brix, and Möhring, and the architect Hermann Jansen. Their suggestions for the Greater Berlin of the future being submitted in printed volumes, with many plans, cannot but prove suggestive in other cities which have an eye to the future. To provide for the needs of the population in the year 2000 is, after all, as one of the prize-winners remarks, to look forward only two generations and not three, as would have been the case not many years ago, when the progress in sanitation had not yet increased the average duration of a lifetime. When will our American cities plan for 1950, to say nothing of 2000?

The recently announced agreement between Russia and Austria in the matter of the Balkans appears to have been no formal agreement upon any definite programme, but a mere resumption of more or less cordial relations after the frigid year and a half that followed Austria's *coup d'état* in Bosnia and Herzegovina. Both Powers have suddenly recalled that an arrangement for harmonious action in the Balkans, concluded in 1897, is still in force. Whereupon Austria, with a fine touch of humor, has remarked that she had promised to stand by the *status quo* in 1897 and she would stand by the *status quo* in 1910, omitting to mention, however, that between 1897 and 1910 the *status quo* in the Balkans had been greatly changed in circumstances more or less within her control. Russia has consented to make the best of a bad bargain, swallow her resentment, and join hands for the maintenance of the new régime in Turkey and the raising of the Balkan peoples.

The Military League in Greece, which has been in virtual control of public affairs since last summer, has at last carried its main point with the convocation of a National Assembly by royal decree. The tiny kingdom under its military oligarchy has presented a curiously mingled spectacle of the serious and the comic. The motives behind the military uprising were laudable enough. Domestic Greek politics have been, since time immemorial, pitifully corrupt. The rotation system of party-government, by which each party took its turn at the public crib with the consent of the other, was as rife there as it was in its classic home, Portugal. With its slender military resources the country was in no condition to pursue an active foreign policy. The revolution in Turkey acted as a spur on Greek military patriotism. On the one hand, here was the hereditary enemy apparently risen to renewed life and power, and hence a menace to be feared more than ever. On the other hand, the example of Turkey showed what a resolute and patriotic army might do in the way of drastic national housecleaning. The final impulse came when Greece, in the face of Turkish threats, was compelled to surrender or postpone her ambitions with regard to Crete. Last summer's military uprising at Athens was the consequence, and was followed in turn by a succession of ministerial crises, a comic-opera revolt like the recent one of Lieut. Tibaldos, and now the summoning of a constituent assembly.

NULLIFICATION IN MARYLAND.

The action of the Maryland Legislature in relation to negro disfranchisement is of a character so extraordinary that the country has not yet waked up to its significance. It does not stand in the same class with the disfranchising Constitutions or Constitutional amendments that have heretofore been adopted by Southern States. These amendments were, indeed, substantially nullifications of the Fifteenth Amendment; but the nullification was covered, in point of form, by the device of the "grandfather clause." By these, men were not disfranchised ostensibly on the ground of "race, color, or previous condition of servitude"; the property and education tests applied to all men alike, but the "grandfather clause" admitted persons to the franchise without submission to those tests, and, of course, the benefit of the "grandfather clause" was accessible virtually to white men only. While this was evidently, in substance if not in form, a violation of the Fifteenth Amendment, the Supreme Court has found it possible to avoid making any decision either sustaining or annulling these State enactments. Every case that has been brought before it has been disposed of on some technical or subsidiary point, leaving the merits of the real issue untouched.

The bills that were hurried through both houses of the Maryland Legislature in the closing days of last week bring on a situation in which no such attitude on the part of the Supreme Court will be possible. If the Court did not spontaneously feel that it must stand forth and assert itself when the Constitution of the United States was challenged by undisguised nullification, the force of public sentiment would irresistibly compel it to take cognizance of the issue. These bills, disfranchising the negro as such, are expressly based on the assertion that the Fifteenth Amendment is not valid, or at least is not binding on the State of Maryland. Thus the issue presented is one that transcends any question either of law or of policy affecting simply the rights of the negro. The indifference that has been shown in the North over the denial to the Southern negro of the rights guaranteed to him by the Fifteenth Amendment has been due to the spread of the feeling that the South should be left to solve its own problems. The inaction of the Supreme Court has reflected that feeling. But now quite a different note has been struck by the anti-negro fanatics of Maryland, and when the country shall have fully realized what that note is, the Maryland leaders may rest assured that the country will be heard from on the subject. The people of the North have not grown so callous or so indifferent that they will permit a precedent like this to be established in silence. They will not submit without a protest to the barefaced nullification of that which was written into the Constitution as a result of the civil war. There can be no doubt that the issue created by the Maryland Democrats will be brought to an actual decision by the Supreme Court, and few men of sense can doubt what that decision will be.

Of course, all this is predicated on the assumption that Gov. Crothers will not withhold his assent from the bills, which were forced through the Legislature by a strict party vote, after their adoption by the Democratic caucus. The Governor himself is in full sympathy with the anti-negro movement, and there is therefore little to hope for in that quarter. And yet there is matter enough to give him pause. So far as we have observed, the entire daily press of Baltimore is opposed to the foolhardy scheme, and many conservative Democrats in that city have protested against it. A resolution denouncing it was adopted by the Methodist ministers at their meeting a few days ago. Far more significant, a number of leading Southern Senators and Representatives have expressed their keen regret at the move, and some of them had previously urged the managers of the Maryland project to drop it. As a legal experiment, it is a wild scheme, doomed to certain failure; as a matter of national politics it is the ugliest manifestation of an anti-national and anti-liberal spirit that has come to the front in many years. The wanton act of the Maryland Democrats promises to lead to a revival of race and sectional antagonisms such as have long been absent from the national stage.

The whole story of the Maryland disfranchising agitation is one that reflects peculiar discredit on the dominant party in that State. Prior to 1895, the government of the State, and of the city of Baltimore, had been held, for more than twenty years, firmly in the grip of one of the most unscrupulous, as it was one of the most powerful, political rings in the country. In that year, by an alliance between the Republicans and a strong body of independent Democrats, the ring was overthrown. From the possession of the State and city governments by the Republicans in 1896, as the result of the decisive victory of November, 1895, dates the improvement of governmental standards and governmental conditions both at Annapolis and Baltimore. Fair elections had been the cry of the Republicans and independents in 1895; and ideally fair elections were established by the Republicans when they came into power. Yet no sooner had the Democrats regained control than they began to introduce every possible sort of contrivance, in the way of election tricks, to make their tenure unshakable. The negro vote is only one-fifth of the total, but the issue of "white supremacy" has nevertheless been worked in the most frantic manner by the Democratic organization; and this without the possibility of pointing to any evil that has come of the negro vote either in the State government or in that of Baltimore city. In certain counties it must be admitted that there have been complaints, but no sincere and genuine attempt has been made to grapple with any such trouble. Wholesale disfranchising schemes, on the model of the Southern Constitutions, have twice been decisively voted down by the people. And now, instead of accepting this twice-rendered verdict, the successors of the Gorman-Rasin ring, aided by a few sincere but visionary lawyers who may be animated by the spirit of Calhoun, are resorting to this wild scheme. It is not a pretty story, and the only consolation is that this latest chapter looks as if it might be the last.

TARIFF PEACE WITH CANADA.

Besides averting a tariff war, the settlement with Canada now bears the pleasing character of a possible prelude to establishing reciprocal trade relations between the United States and that country. In paving the way toward so desirable a result, Mr. Taft has performed a notable service. The letters exchanged between Secretary Knox and Finance Minister Fielding, immediately after the adoption of the agreement,

show how strong is the disposition on both sides toward a liberal trade policy in the future. "The agreement," says Mr. Knox, "encourages the hope that the future trade relations of the countries will become even more intimate and expanded, and will be regulated in a spirit of cordial reciprocation and interdependence." And Mr. Fielding, in reply, declares that the Canadian Government "very heartily reciprocate" this sentiment, and "will gladly avail themselves" of the President's invitation to take up, at such time as may be mutually satisfactory, the consideration of a readjustment of the trade relations between the two countries "upon the broader and more liberal lines which should obtain" between them. All this is matter for sincere congratulation, and is very different indeed from what, for a while, seemed the possible outcome.

If the concessions actually obtained from the Canadians are of insignificant magnitude, that fact must be ascribed to the weakness of the position in which we were placed by the maximum-and-minimum feature of the Payne-Aldrich law. It was felt by the Canadians that the threat of the maximum was one that we should not dare to carry out, on account of the injury which such an increase of duties on Canadian products would inflict on our own people. They regarded it as a bluff; and, if they did not actually call the bluff, they came as near doing so as could be done without putting us in a position where we might have been compelled, for the sake of saving our face, to plunge into a tariff war, however little we liked to do so. In replying to questions in the Dominion Parliament, Mr. Fielding stated the case with great frankness. "If we had stood pat, it is possible we might have in some way obtained the minimum American tariff," said Mr. Fielding. But good relations with the United States, he continued, were better than a spectacular triumph. "If we could avoid a tariff war by granting some, and from our point of view not very important, concessions, it was far better in the interest of Canada for the present and the future that we should make the concessions rather than to triumph over the United States on terms which would have left soreness and ill-feeling and created friction in future negotiations." A remark made by Sir Wilfrid Laurier, the Canadian Premier, is also highly interesting. While appreciating the strong sentiment in this country adverse to a tariff war with Canada, he also recognized the fact that there is in the United States a high protectionist group, which is willing and anxious to push the President into such a contest. "The Canadian Government did not feel," said the Premier, "that it should give its aid to further the ends of this group by making impossible conditions for the President."

It is unnecessary here to enter minutely into the actual concessions that were sought, and the concessions that were made. They bring up the old story of the "most favored nation" question. On a certain list of articles, France had secured from Canada reductions of from 2½ to 5 per cent., in return for equivalent concessions on her own part; and these concessions were automatically extended to thirteen other nations under the most-favored-nation clause in their treaties. We had made no treaty concessions to Canada, and the concessions to France were not, therefore, regarded by Mr. Taft as constituting "undue discrimination" against the United States; but the same concessions, extended to other countries entitled, under their treaties, to most-favored-nation treatment, did seem to him to justify the charge of discrimination against us. The logic or metaphysics of this position is ticklish; but the knot was cut by the homely process of splitting the difference. The difference, to be sure, does not seem to have been split anywhere near the middle; we get the "intermediate" rate on thirteen items, out of the forty originally in question. The quantity of our exports to Canada affected by this reduction of 2½ per cent. ad valorem is about $5,000,000 out of a total of about $180,000,000. But it is stated that these articles on which the concession is granted comprise virtually all the commodities in which there is competition between the United States and the favored nations; and on this principle the selection was made.

Satisfactory as it is to have the difficulty decently settled, and gratifying as is the fact that what started as a wrangle has ended in a prospect of liberal relations between the two countries, one cannot avoid feeling the pettiness of these higglings between two enlightened and large-minded peoples. The matters involved are undoubtedly important to particular business interests, and it is to the credit of either government that painstaking care is bestowed on the safeguarding of those interests, so far as they are legitimate; but, after all, it is right that we should take also a broader view. Think of all the higgling, and all the diplomacy, and all the anxiety over political and commercial consequences; and then consider that what we have got out of it is two and a half per cent. on five million dollars in the total amount of duty to be paid on imports into Canada from the United States—a reduction of $125,000 a year! The want of perspective that is so characteristic in the whole domain of foreign trade is nowhere more in evidence than in these tariff wrangles. The exaggeration of their importance, the factitious dignity and consequence they are by common consent allowed to assume, are of a piece with the readiness which people show, the world over, to accept at their own valuation the inflated claims of commercial jingoes as to the momentous importance of this or that bit of foreign trade, the world-shaking significance of this or that petty obstacle to its development. If an instinctive questioning of the magnitude of the matters involved were to become habitual, most tariff wars would be laughed out of court, and most threats of war by flood and field for the sake of commerce would be treated with the contempt they deserve.

THE CONSTITUTIONAL STRUGGLE IN ENGLAND.

The debate on the question of the Lords in the House of Commons has confirmed the feeling that a contest of great depth and intensity is before the people of England. Mr. Asquith, in his opening speech, seems to have made no concession to that sentiment of conservatism to which Lord Rosebery's resolutions, almost unanimously adopted by the House of Lords, make their appeal. The position laid down in the Premier's motion and supported by his speech was aggressively challenged by the leader of the Opposition. A notable utterance of Mr. Balfour's was that in which he declared the existence of the House of Lords more than ever necessary now, when "modern radicalism has revolutionary ideals and aims upon

which the people should be consulted before their final adoption." Between this position and that asserted by Mr. Asquith, when he said that the "absolute veto" of the Lords must be abolished in order that the road may be cleared for the advent of "a full-grown and unfettered democracy," lies the antithesis upon which the vital thought of the country must be centred.

If the question thus presented were bound up with the House of Lords as at present constituted, there could be little doubt of the result; but it is not on this line that the issue is being joined. Not only from the standpoint of democracy, but from the standpoint of efficacy for its own function of conservatism, the House of Lords has at last reached the point where its inappropriateness and shortcomings are universally recognized as calling for far-reaching reforms. The democratic sentiment of the time will not much longer endure the possession by a purely hereditary body of power so substantial as that which the peers now exercise; and, on the other hand, it is seen that a body whose tenure of power rests on so uncertain a basis, a body so subject to subversive agitation, cannot exercise its function with réal independence; except in cases of the most extreme kind, it is ready to sacrifice its judgment rather than run the risk of a collision. In this situation, two proposals of opposite character are presented to the consideration of the people. On the part of the Liberals, the country is asked to leave the composition of the House of Lords—at least for the present—unaltered, but to reduce its power to something approaching insignificance; whereas the Conservatives propose to improve the composition of the body by some as yet undefined method which abandons the unqualified principle of heredity, and thereby to make it a more vigorous and more potent Second Chamber. If this plan should be matured in a wise and far-seeing manner, it will make a strong appeal to the conservative instincts of the people of England. As between a reformed and strengthened House of Lords, exercising the function of a check on the House of Commons without being overwhelmingly representative of the landed interests and of one political party, and a House of Lords unreformed but almost impotent, no one can say how many thoughtful Liberals may choose the former alternative.

To Americans, Mr. Asquith's appeal to the idea of a "full-grown and unfettered democracy" may seem to be essentially a call to England to adopt the system obtaining in our own country. But to give the House of Commons almost unchecked predominance, as Mr. Asquith's resolutions propose, would be to introduce a system profoundly different from that in America. Nor is it the existence of the Senate in which that difference lies, for the Senate is, after all, in the main, only a more slowly moving body of representatives; any strong popular movement, sustained for the space of two or three years, is capable of sweeping the Senate, as well as the House and the Presidency, along with it. It is our written Constitution, with its Supreme Court endowed by the Constitution with unparalleled powers in the annulling of legislation, and with its division of authority between the States and the Federal Government, that stands in this country as the great check upon a "full-grown and unfettered democracy." If, indeed, the House of Lords had in practice the "absolute veto" which it has theoretically, and which Mr. Asquith declares it his purpose to abolish, it would, of course, be a more effective barrier against an unrestrained democracy than is our written Constitution; but the unwritten Constitution of England has long reduced the function of the House of Lords to the staying of legislation until the will of the people has been uttered with what all men feel to be unmistakable authority. That, to be sure, is a very great power; but it is not in any true sense an "absolute veto," and it is in many directions not as substantial a barrier to radical change as is our own Constitution. The example of America cannot, therefore, be cited in favor of the emasculation, though it may be invoked in favor of the better lodgment, of the functions of the Second Chamber.

With so fundamental an issue at stake, it must be deplored by all right-minded men, whatever their standpoint, that the parliamentary system offers no guarantee that the question will come before the people for a clear decision on its merits. An inestimable service would be rendered to the cause of parliamentary government if leaders on both sides were to forego all the other questions between the parties and stake the coming election on this great question alone. It has no connection whatsoever with that other great question, of free trade against protection, which was probably the leading factor in the recent electoral contest; and as for Irish Home Rule, that will take care of itself, because the Irish will vote virtually as a unit against the House of Lords, whether Home Rule is or is not explicitly brought into the canvass. If an understanding could be established that the new House of Commons would not deal with the free-trade question, and that the verdict of the people, whichever way it went, would not be regarded as signifying any preference on this head, a contest could be carried on whose character was worthy of the great question at issue, and whose result might be looked forward to as the true judgment of the nation.

CORPORATIONS AND CONSCIENCE.

Of the making of many problems nowadays there is no end. And of the magnifying of those problems that we have ready-made there is an abundance. In the leading article of the current number of the *Political Science Quarterly*, Mr. Joseph B. Ross discusses seriously and learnedly "The Attitude of Private Conscience Toward Corporate Right." With the natural instinct of the specialist he endeavors by delving far beneath the surface to find the explanation of certain familiar experiences. "The cause," he tells us, "of the misunderstanding and of the consequent antagonism between the industrial or commercial corporation and the public lies very largely in a failure to realize what the corporation actually is." And again: "It seems rather anomalous and difficult of comprehension that a form of industrial organization which universally commends itself to the business world should yet be visited with marked popular opprobrium." Mr. Ross ascribes to the average man a feeling of mystification due to legal elements in the status of the corporation which he knows to be something in the nature of privilege, but of which he can clearly make out neither the basis nor the nature. Of such elements Mr. Ross enumerates many: for instance, "the State has made it possible for the corporation to repudiate its debts by pleading its limited capital stock and the statutory lia-

bility of its stockholders." And in conclusion he declares that "undoubtedly the causes of the misapprehension and of the deep-seated antagonism between American laymen and the private corporation, its directors and its stockholders, lie in the enigmatical personality of the corporation—a personality certainly existing, but not yet arrived at a maturity of its powers nor aware of its profound social obligations."

But, after all is said and done, we do not seem to have got much further than the plain man gets when he harks back to that old dictum of Lord Thurlow's, that a corporation has neither a body to be kicked nor a soul to be damned. And indeed not so far. For, since Lord Thurlow's time, we have advanced a long distance toward the kicking of corporations; and, at the same time, the vast spread of the system over the industrial and commercial world has resulted not in strengthening but in greatly weakening animosity against corporations as such. While there may be a certain mild recognition of the difference in responsibility and responsiveness between a corporation and an individual or a firm, it is doubtful whether one man in a hundred is perceptibly influenced by it either in his sentiment or in his conduct. It is not corporations in general, but two special kinds of corporations against which popular prejudice is arrayed and towards which many individuals feel themselves absolved from the ordinary obligations of conscience. These are public service corporations and corporations which are or are supposed to be of a monopolistic character. And in these cases the reasons for this hostile, or even this unscrupulous, attitude are not far to seek. In the matter of monopoly, the thing speaks for itself; in the case of the public service corporations, we have, in addition to the anti-monopoly sentiment, the feeling, whether well-founded or not, that by illegitimate means they have obtained privileges burdensome to the public. To see how little the idea of the corporation in itself has to do with the matter, one has only to imagine the street railways of New York to have always belonged to Mr. Belmont personally, or the Standard Oil to have been created and owned by Mr. John D. Rockefeller alone. Does any one suppose that public feeling towards either of these establishments would have been more gentle, or that people would harbor any greater sense of obligation to treat them with scrupulous regard for their legal rights?

Of course, the impersonality—partly real and partly apparent—of the corporation does make a great difference in the strictly human side of many relations with it; but this difference is inevitable from the nature of the case, and we shall never by taking thought get rid of it. It is quite as important to avoid exaggeration of the effect of this circumstance as it is to recognize its existence. Against a corporation as such, a corporation not identified either with the idea of oppressive monopolistic practices or with that of special privileges, the average man neither entertains hatred nor exercises unfairness. Almost every instance of such conduct towards corporations cited by Mr. Ross could easily be matched in parallel cases where the party concerned was an individual and not a corporation. Even such an example as the eager rush for railway passes—in the days before the recent anti-pass legislation—is much more readily explained by a simple weakness of human nature or a defect in common honesty than by any peculiar state of mind arising out of the mysterious nature of the corporate entity. No one ever heard of people being shy about getting theatre passes, even before the days of the Theatre Trust; the automatic instinct for getting, or seeming to get, something for nothing is amusingly illustrated in the rush for ice cream and salads at every social gathering; and as for deception, it is only necessary to ask any unincorporated doctor how many otherwise respectable persons resort to queer devices in order to get medical services for little or nothing.

Finally, as to the necessity that the corporation shall become "aware of its profound social obligations" as a condition precedent to receiving fair and decent treatment from the average man. In regard to all this class of considerations, we are both more and less sanguine than those who constantly hold up to our view these high and distant ideals. It will be long before the recognition of "profound social obligations" becomes the dominant factor in the conduct of either corporations or individuals—unless, indeed, by profound social obligations is meant those profoundest obligations of all, which are as old as civilized history. The homely but faithful performance of the plain duty not to steal, not to lie, not to cheat; the recognition of the simple claims of human beings to that ordinary consideration which stays the hand of the strong from merciless destruction of the weak—these obligations, indeed, it is the immediate duty of corporations to observe. Many corporations have always observed them; the number of those that do not is, we are sure, destined rapidly to grow less since the public conscience has become awakened. Let us demand of them that simple righteousness which all men recognize as duty, and the absence of which all men recognize as wickedness. Then, for the beautiful state of the future we can afford to wait with patience.

GREAT BRITAIN IN EGYPT.

The protest issued by the Young Egypt Committee at Geneva against Mr. Roosevelt's pro-English address before the students of the University of Cairo fell into serious error. That distinguished traveller was actuated in his remarks by no desire to please his official hosts. It is doing him a wrong to imagine that he would sacrifice his convictions to curry favor with anybody. In the present instance it was almost inevitable that he should have assumed the position he did. He found in Egypt a people on a somewhat backward cultural plane, ruled by a handful of strong white men. He saw there the far-famed efficiency of British administration brought to probably its highest pitch. The British rulers in Egypt are men who do things and get results. Under them the country has made unquestioned material progress. Here, then, was the white man's burden carried along strenuously, successfully, and, on the whole, quietly too, if it were not for the clamor of a few malcontents who would have self-government, and Egypt for the Egyptians, and a good many other wild things. Could these so-called Nationalist agitators promise Egypt as efficient a government as England has given her these last twenty-five years and more? No. Then the question was settled for Mr. Roosevelt. On the same grounds that he lauded the British rule in India when he was still President, he bestowed his approval upon British rule in Egypt.

And in India and Egypt both, the British have been facing the same problem ever since the Russo-Japanese war gave birth to new hopes among the subject races. Great Britain, like many a conquering people before her, finds it hard to understand why the nations to whom she has brought peace and material well-being should chafe under her rule. It is well enough for the island-born Englishman to insist on taking care of himself, even if he does it badly, rather than have things carefully smoothed out for him from above. It is absurd for the Bengali or the Egyptian Nationalist to assume the same attitude; first, because, in his case, it has been demonstrated that he is unfit to take care of himself, and secondly—and the argument is legitimate enough—failure in his case would also spell trouble and worse for Great Britain herself, and for the world at large. In India, for instance, the British assert that they have brought order and stability where formerly there was civil war and oppression. Let Great Britain withdraw, and India would become a cockpit for its own hostile races and religions and a prey to Russian or Japanese or German ambition—who knows? Can a handful of Babu lawyers hold together an empire of 300,000,000 people?

But as between Egypt and India there are certain important differences which give the former country much the stronger case against Great Britain. And this in spite of the fact that Egypt, unlike India, cannot deny that British rule has brought prosperity to the country. Egypt has no devastating plagues and famines to complain of. Her population has nearly doubled since 1882, and the national wealth has more than kept pace with the population. The primary reason for discontent is, therefore, apparently absent, until we recall that it is comparative prosperity, and not helpless destitution, that nourishes political unrest. The very fact that Egypt is prosperous offers a powerful reason why England cannot hope to keep it permanently in subjection. But more important still is the absence in Egypt of those racial and religious divergences in which England finds the chief need for her presence in India. Of Egypt's nearly 12,000,000 people, less than a million are Christian and Jewish. Over 92 per cent. of the population is Mohammedan, the very class which England regards as constituting the most peaceful, the most industrious, and altogether the most promising element in India. In Egypt, therefore, there can be no question of racial or religious warfare. The population is homogeneous, compact, and not so numerous as to make self-government the momentous task it must be in India.

The reasons for Egyptian Nationalism are, clearly, far from negligible. England's presence in Egypt cannot be explained as due to the people's incapacity for self-government. It was not civil war or any other form of popular misdemeanor that first brought England into the land, but the insane financial extravagances of a Khedive who virtually delivered his country into the hands of his foreign creditors. The revolt of Arabi Pasha in 1882 was a protest against foreign domination, and England's subsequent intervention was dictated solely by her interests as part holder of the foreign debt and as owner of the Suez Canal. If the temporary British occupation has become permanent, it is not primarily because the welfare of the country required it, but because British Imperial policy demanded it. The fact that the Khedives Ismail and Tewfik brought Egypt under foreign domination does not prove that the people itself is unfit to be entrusted with a large measure of self-government. That is what the Egyptian Nationalists maintain, and they have the recent experience of Turkey to hearten them.

CONFESSIONS OF A PROFESSOR.

While our colleges of liberal arts are groaning with their regrets, their misgivings, and their sins, Prof. Grant Showerman has seen and stepped into an opportunity. In a book of essays, entitled "With the Professor," he attempts, with a limpidity of style and a gentle temperance recalling the Elia of Cambridge, Mass., to relieve the stuffed bosom of higher education by ingenuously revealing to the world the present sensitive and uneasy state of the professorial mind, its inner conflicts, and its discordant environment. For a confessional medium he has created, after the fashion of one of Anatole France's innocent sages, a bald-headed teacher of the classics with an aspiring wife and six children. (That "six" is a rather unrealistic touch.) In the course of his lucubrations this very typical academic gentleman pretty nearly exhausts the stock topics of academic society: salaries, receptions, cost of living, merits of teachers, research, and educational policy. Readers in university communities, East and West, will find themselves testifying to his representativeness by exclaiming "That's our college through and through," "That's I" or "me"—according to their grammatical faith.

But to represent things from certain points of view is to satirize them; by virtue of his humanistic standpoint "the Professor" is a satirist. In these days of universal elective franchise no one knows the object of education; the object of educators, however, or, more accurately speaking, of their wives and daughters—is "getting on." The driving power is not the desire to learn and teach, but a desperate ambition to gain and maintain a footing on a $2,000 salary in a society where the average income is three or four times as great. The rising young instructor, therefore, is compelled to be a hypocrite. He must devote his energy to doing things in which he does not believe—writing articles on "Terminations in T" and "Suffixes in S"—in order to win the hollow approbation of the learned, which leads to promotion. "The Professor" entertains a rather undignified conception of the function of the various scientific and philological journals. He is so cynical as to suggest that contributors should be obliged to pay regular advertising rates. One does not like to think that there is any occasion for such stringent measures. Yet of a piece with this insinuation of commercialism in the studious cloister is the satirical rogue's description of an elaborate university social function, in preparing for, going through, and getting over which some ten hours are consumed by the instructor and his wife, with a net result of ten minutes of social intercourse. This agony, too, like the barren sweat of "research," is a propitiatory offering to the God of Getting On. The cure for these evils is easy to prescribe and "pleasant to take"—$15,000 a year.

Behind the satirist, however, is a dismayed and bewildered believer in humane culture—the pensive and melancholy Ossian of contemporary education. He stands by the graves of Homer and Virgil, and mourns for the

bygone days. Since the great educational revolution and the irruption into the colleges of the Third Estate, he has witnessed the defeat, demoralization, and dispersal of the intellectual nobility. A new and alien order of mechanics, engineers, business men, farmers, linguistic cranks, and scientific pedants possesses the field. Their means are not his means, nor their ends his ends. He is among them but not of them; he moves with them, but keeps step to another drummer. He is something of a sentimentalist: he expresses his dissent with the sound of a harp, when the crisis calls for a trumpet. In his ability to excite sympathy with his ideals and in his inability to suggest or institute practical reforms—in his quite resourceless idealism—Professor Showerman's "Professor" fairly symbolizes the faculty of liberal arts in a large university.

"The Professor," like many contemporary humanists, imagines that his melancholy arises from his recollection of the old régime. As a matter of fact, it arises from his ignorance of the history of education. Hearing him talk, one would be led to suspect that in the good old times before President Eliot students were fired with an inhuman love of liberal culture for its own sake. As a matter of fact, Ascham and Peacham and Milton and Locke and Chesterfield advocated a liberal education primarily because it was the most valuable and practical training for a liberal career. The scholar-gentleman contemplated in the aristocratic classical curriculum was destined for activities calling constantly into play both gentlemanliness and scholarship. He was destined for a part in good society and a part in public life; for these definite ends he was supplied with ancient and modern languages, ancient and modern history, philosophy, logic, rhetoric, etiquette, and the graces. There was a clearly shaped educational policy, because there was a clearly conceived educational object. "The Professor" is in despair, because he feels a hopeless and entirely untraditional desire to transform all students into scholars and gentlemen—a desire which Burke would have told him is at war with nature.

"The Professor" has a very pretty chapter in which he rejoices that the pursuit of culture is his means of livelihood. To put it in brutal English—he needs languages, literatures, history, philosophy, rhetoric, etiquette, and the graces *in his business*. But the teacher of classics is not unique in needing these things. They are needed also by men of letters and teachers and critics of literature, by historians and philosophers and teachers of philosophy and history, by editors, publishers, clergymen, college presidents, diplomats, and statesmen. For these classes, at least, a liberal culture is the most definite kind of training for "success in life." In this age of intolerance for purposeless and indolent Goodness and Beauty, perhaps the hope of future usefulness for the college of liberal arts lies in frank competition with its rivals not for the women and weaker brethren, but for the young men of ambition and promise, desiring to qualify themselves for the careers—more numerous now than ever before—open to liberal scholars and gentlemen. If it would but condescend to inscribe over its portals, "We, too, train for life," it could reduce the chaos of election, form an educational policy, give what is now demanded of every college, and at the same time gain what it privately desires.

THE GREEK GIFT TO CIVILIZATION.

I.

The Greeks meant one thing to men of the early Renaissance, another thing to Pope and Addison, another thing to Germans of the nineteenth century. Every generation has taken its Greek in its own way. And the present generation, heir of all the ages, is taking its Greek in nearly every way—except one. It is *not* taking its Greek for granted. An expositor of Hellenism to-day is almost obliged to become an apologist. He must "show us." Even as seasoned a Grecian as Professor Mahaffy,* who surely is entitled, if any one is, to be at his ease in Hellas, does not resist this compulsion. The quiet and still air of his delightful studies is stirred with argument, about Greek in the college curriculum, about the neglect of Aristotelian logic by American youth, about, on the one hand, Greek *versus* "Science," and, on the other hand, the truly "scientific" temper of Greek thought. Throughout he seems to feel that the Greeks need to be vindicated; and their vindication, throughout, is that they are "modern."

This seems to mean that they are free from mysticism and obscurantism, those sins of the Middle Ages; and Professor Mahaffy is the more inclined to praise Greek clear-sightedness in virtue of his own long-standing feud with mediævalism. There is a fine old-fashioned flavor, as of some clergyman in Thomas Love Peacock—a Ffolliott, a Portpipe, an Opimian—in the valiant no-Popery flings of our author against the church and against the theological prepossessions of mediæval science and philosophy. The modern contentiousness about Greek here receives a temperamental reinforcement.

All good things being Greek, and all bad things non-Greek, the Middle Ages were non-Greek; and the Renaissance, which put an end to them, was Greek. Such seems to be the latent reasoning at the bottom of Professor Mahaffy's view—and we admit it to be the popular view—that by means of a resurgence of Greek art, literature, and philosophy, the Renaissance superseded the Middle Ages, and that the Renaissance was in spirit and accomplishment truly Greek, truly classical. The naïve assumption of the humanists that they had emerged from a "thick Gothic night," Professor Mahaffy would modify by substituting "Latin" for "Gothic"; and, having thus given a bad name to the Scholastic Philosophy, to Romanesque and Gothic architecture, to the "Dies Iræ" and to the *chansons de geste*, he would contentedly hang them all. Now, he believes, upon the thick Latin night up rose Greek, and up rose the sun: the classical Renaissance and the "modern spirit" were a twin birth of the revival of Greek studies (pp. 18-19). This view seems to us erroneous; and, as the conceptions underlying it determine Professor Mahaffy's treatment of his subject, we shall examine it at some length. Waiving all questions of chronology, disregarding therefore all mediæval anticipations of the Renaissance or of the "modern spirit," granting that the light did not dawn till Greek began to reappear, and then dawned decisively, we believe it would not be difficult to show that the Renaissance itself was not essentially Hellenic.

II.

The literature of the Renaissance, both in and out of Italy, is four-fifths of it Latinistic—Virgilian, Ciceronian, Senecan, occasionally Horatian, very heavily Ovidian. It springs not immediately, often not mediately, from Homer, Demosthenes, Pindar, Æschylus, Sophocles, or even Euripides. The other fifth, which does draw nourishment from Greek literature, draws it from the Greek literature not of the golden but of the silver and the pinchbeck ages. Boccaccio, Professor Mahaffy points out (p. 95n), is indebted to Greek prose fiction; but what he does not point out is that Boccaccio's debt

*"What Have the Greeks Done for Modern Civilisation?" The Lowell Lectures of 1908-09. By John Pentland Mahaffy, C.V.O., D.C.L. (Oxon.), etc., of Trinity College, Dublin. New York: G. P. Putnam's Sons. $2.50 net.

runs mostly to very late Byzantine romances now lost. Lyly draws from Plutarch on Education. Sannazaro breaks from the Virgilian pastoral tradition to return to Theocritus. Tasso's "Aminta," as is well known, gets what is probably its most famous passage from the late prose romance of Achilles Tatius. As is not so well known, the "Jerusalem Delivered," too, professedly a restoration of the classical—that is, the Virgilian—epic, in reprobation of the composite romance-epic of Pulci, Boiardo, and Ariosto, is itself full of the conceits of late Greek rhetoric. The "Pastor Fido" is based upon a story in Pausanias. It seems well within the truth to say that where Renaissance literature is Greek at all, it is almost certain to be in the Alexandrianized, Romanized, Byzantinized, and Orientalized vein that we call Greek only because we have no better name for it.

The art and the philosophy of the Renaissance, like its literature, do not draw from pure Hellenic fountains. Botticelli, Raphael, and Titian are not inspired by Greek statuary of the best period, very little of which had been unearthed; Greek painting was probably unknown to them, and, at any rate, Greek painting, as far as it has survived at all, is of the Campanian, the Alexandrian style—distinctly post-classical. The *putti* of the Renaissance may, indeed, it is thought, be traced to the "Egyptian plague of Loves"—those Cupids, which, whether attendant upon the amorous adventures of the gods, or nesting in trees, or wreathing garlands, or exposed in cages for sale, "flutter through the Pompeian pictures." And where the great painters of the Renaissance thought of themselves as illustrators of "literary" themes (we are just rediscovering how decidedly they did so think of themselves—to the confusion of "Art for Art's sake"), they looked for their themes not in Homer, or the tragedians, or the myths of Plato, but in Ovid, or Apuleius, or Philostratus, or Lucian. Raphael's frescoes in the Farnesina got their Olympians not from Hesiod but from Apuleius. Botticelli's Calunnia, as Professor Mahaffy mentions elsewhere, is derived from Lucian's description of the Διαβολή of Apelles. Mantegna Titian, Raphael, Giulio Romano, and others deliberately retranslated into color and visual form the verbal descriptions by Philostratus of paintings in a supposed picture-gallery.

As for the Platonism of the Renaissance, that too was composite, with its leaning toward pseudo-Dionysian hierarchies and toward elaborate theories of love. It was the Platonism of Plotinus, rather, after the school of Alexandria; for, in spite of Ficino's translation, the Platonism of Athens was to them unknown—or, when known, too purely Attic to be assimilated. There was, indeed, an echo of pre-Socratic Greek thought in the animistic philosophies of Southern Italy; but these Professor Mahaffy does not mention, despite their influence upon Bacon by way of Telesio and Campanella.

In general, Renaissance taste is distinctly unclassical. It runs to digression and irrelevancy; to inserted descriptions and episodes; to huge verbosity. It revels in the "word-paintings" (ἐκφράσεις) which were a specialty of the late sophists and rhetoricians; it never tires of their speechmaking. It favors whole bookfuls of orations invented as patterns of the kind of thing that might be said upon a given occasion by persons imaginary, mythological, or historical. These ἠθοποιεῖαι and μελέται bulk large in the Anthology, and reappear in collections like "Silvayn's Orator"—to mention, perhaps, the most familiar name among many. The prose of the Renaissance, again, like late Greek prose, tends, without resistance, to the most exaggerated conceits and antitheses, each country in Europe developing its own particular brands of bad taste—Euphuism, Gongorism, Marinism, and the rest—upon a common basis of Ciceronian and late Greek rhetoric. In imitation, too, of the *tours de force* of degenerate Greek and Roman rhetoricians, the versifiers of the Renaissance often chose the most trivial themes, and embellished them with all the graces of *double entendre*. To match the antique disquisitions Of Long Hair, and In Praise of Baldness, we have the *capitoli* of Berni and his school on Figs, Beans, Sausages, Bakers' Ovens, Hard-Boiled Eggs, Chestnuts, Paint-Brushes, Bells, Needles, Going Without Hats, and Lying Late Abed. It is a far cry from this sort of thing to Homer or to the Periclean age. Indeed, if by Greek we mean "classic," the Renaissance was not Greek. Not until the late eighteenth century, after the way had been cleared by those "pedants," German and other, to whom this work alludes so slightingly, was the true Renaissance of classic Greek accomplished; only then may the modern world be said to have entered fully upon its Greek heritage. What the Renaissance of the fourteenth and fifteenth centuries achieved was rather a Pan-Latinistic revival, which attended especially to the process of recasting and enriching the vernacular tongues, mostly by means of Latin or post-classical Greek models, into vehicles of a modern *Eloquentia* that might rival the antique. Its degenerate models, together with its own taste in choosing them, made it not pure, reposeful, imaginative, but composite, unquiet, fantastic, rhetorical, loquacious—all that is suggested when we say "Alexandrian."

III.

One cannot help feeling that Professor Mahaffy's taste in these matters has been "subdued to what it works in" by his extensive studies of post-classical Greek. This bias appears in the estimate of Aristotle's "Poetics" and the dicta about Wordsworth, Tennyson, and others. The "Poetics" is treated as if it were merely a collection of judgments upon individual works in Greek literature: if these judgments are erroneous, the work is a failure, of course. It is not perceived, apparently, that the "Poetics" is an exposition of basic principles, the principles of poetry and of art in general; and that, in its justification of poetry as an imaginative embodiment of the *universal* (a view which Plato, for all his poetry, completely missed), and in its promulgation of the law of unity, it laid sure foundations for the criticism of all time, and established an unassailable canon of classic or ideal art. All this apart from the historical importance of the "Poetics" misunderstood—apart from the pseudo-classic of the sixteenth, seventeenth, and eighteenth centuries, apart from the controversies about "imitation," *catharsis*, and the "three unities." Of this really fundamental book Professor Mahaffy says (p. 62): "I know of no poorer and more jejune exposition of a great subject"; and on the next page he cavalierly dismisses it upon the plea of lack of time. The same want of appreciation of the universal in Hellenism is responsible for some of the opinions here expressed upon the Greek in modern English poetry. Of the "galaxy that illumined the early nineteenth century," Wordsworth is considered to be "the least Greek" (pp. 56-7); and this because of his failure to distinguish prose diction from poetical, and because of the inordinate length of the "Excursion." Keats, however, had caught the Greek spirit, though at second or third hand (p. 46); in Shelley, "we have that perfect combination of romantic imagination with Greek culture" which makes him the greatest of this group (p. 56); and Tennyson is "the most classical of our modern lyric poets" (p. 59).

Read in view of the critic's Alexandrian bias and of the quotations which illustrate his criticism, these dicta become plain. Keats is Greek in being a master of isolated sensuous images, chaste or voluptuous—not in virtue of his delicacy in selection or his passion for beauty; certainly not in virtue of that architectonic which he never possessed. Shelley's "clouds and sunsets" and spirits and flower-bells and pavilions—the imagery of romanticism—are at the service of his revolt and of his love of Greece and liberty. What matter that Shelley hardly touched human experience, hardly touched the general life of man? The case is still clearer when we come to Wordsworth and Tennyson. Of Wordsworth's purity and wisdom—of his *universality*, and of his

"plain and noble" style—of all that makes him a true classic, a true Greek despite his recurrent prosiness—there is not a word; though, of course, the specific Platonism in Wordsworth's wonderful Ode (misquoted at p. 243) is recognized. But what of "Laodameia"?—

. . . For the gods approve
The depth, and not the tumult, of the soul.

What of "Dion"?—

So were the hopeless troubles, that involved
The soul of Dion, instantly dissolved.
. . . . . .
Him, only him, the shield of Jove defends,
Whose means are fair and spotless as his ends.

Or—to take Wordsworth not on classical ground, and in a vein not sententious—what can be more Greek than those autochthonous figures of the Leech-Gatherer, and of Michael at the unfinished sheepfold?—

. . . 'Tis believed by all
That many and many a day he thither went,
And never lifted up a single stone;

or this about Michael's wife:

Whose heart was in her house: two wheels she had
Of antique form, this large for spinning wool,
That small for flax; and if one wheel had rest,
It was because the other was at work.

—lines of which Homer would not need to be ashamed. One might as well say that Millet's Sower is not Greek, or that Lincoln's speech at Gettysburg is not Greek—Greek as Simonides! Finally the Hellenism of Tennyson is here supposed to be shown by the "Lotos Eaters" and the Theocritean "Come down, O maid," and that well-nigh intolerable piece of oxymoron and antithesis,

His honor rooted in dishonor stood,
And faith unfaithful kept him falsely true.

So much of Tennyson's work is Greek in a very pure sense that it seems a pity to try to prove him Hellenic by what at best can prove him only Alexandrian.

IV.

While professing to deal with Hellenism in the modern world, the present volume gives much space to an examination of its remote origins, under the various aspects of race, poetry, prose, philosophy, and the like. To us this seems irrelevant; what we ought to be concerned with here is issues, not origins. We have already adverted, perhaps more than enough, to the treatment of the Greek decadence as if that were the essentially Greek. Both ways attention is too much drawn from the centre to the ends, and not fixed, as in so short a work it ought to be fixed, upon that definite period during which the Greeks were most themselves. We want a focus; and we have here a penumbra. Are we demanding too narrow a canon of Hellenism? We think not; for it is only a strict sense of what the Greeks stood for that gives weight and value to assertions about their influence. That which they really contributed to modern civilization is obfuscated by inquiries into their origins, hardly less than by the inclusion of their decadence upon the same footing with their prime.

But one begins to realize after a while that the author is scarcely appreciative of the characteristic *universality* of the Greeks; that what appeals to him is rather their rhetoric than their idealism, rather their fancy than their imagination, rather their cleverness than their genius. He himself steadfastly declines to generalize—and who could more safely generalize than he?—about the nature of the Greek gift to civilization. He refuses to grasp *this* universal. Surely he sees it; he presents abundant material for the induction; why will he not, for the real illumination of his readers, tell them what he sees? He will make no synthesis. He resides in detail, detail which, as has been seen, too often concerns irrelevant beginnings or degenerate endings; and he yields now and again to the temptation to digress and to argue, like any Alexandrian of them all. In a word, this book about the Greeks is not written in the spirit of the Greeks.

Some merits it undoubtedly possesses. Its dedication, its close, are noble in feeling. Its chapter on politics is vital with modern instances: the abdication of power by an aristocracy, exemplified by Ireland; the conflict of centralizing with decentralizing forces in a federation, exemplified by the United States. And as Professor Mahaffy's venerable experience justifies him in coming to us to admonish and to warn, he speaks, in the same chapter, words of weight upon the failure of intellectual refinement to guard against political decadence, and upon the decay of the middle classes through limitation of the size of the family as a result of heightened cost of living — troubles which threatened Athens no less than they threaten us today. Here Professor Mahaffy might say with Whistler: "I am not arguing; I am telling you." In passages of such "timely" purport, intensified as they often are by the author's personal feelings and experience, this book is at its best. Compared with the works of other writers in the same field, it seems to us inferior, say, to Professor Butcher's "Some Aspects of the Greek Genius" and "Harvard Lectures on Greek Subjects," and to Mr. Lowes Dickinson's "The Greek View of Life"; the first two full of safe generalizations amply supported by specific facts, the last, by its admirable coherence and exquisite employment of transition recalling the prose of Plato himself. Yet, despite these, and despite Professor Sandys's "History of Classical Scholarship," the true history of the Greek element in modern civilization—of its varying acceptance by different peoples and ages, of its varying combinations with national spirit and with *Zeitgeist*, and of the varying outcome—remains still to be written: *valde desideranda*.

May we, without attempting any part of such a history, be permitted to suggest the generalization that this book withholds?

V.

The Greeks, more than all other peoples before or since, believed in the power of mind, and practised their belief. Applying mind to the raw material of sensation, they turned experience into wisdom, fact into truth, the Many into the One, chaos into law, the particular and provincial into the ideal and the universal. But they were not content to rest in this supersensible region: they reëmbodied their ideals in noble sensuous and intellectual forms, which they chose from amid a welter of forms possible but ignoble or insignificant, and which therefore have appealed to mankind *semper, ubique*. So that, whether in the subtle curves of a building, or in the proportions of a statue, or in the shape of a vase, or in the notes of the musical scale, or in finding how the human mind, out of an infinite number of ways in which it can work, actually does work towards truth; whether in art, or letters, or logic, or science, or a hundred other departments of human activity, we still perceive that they have performed for mankind, once for all, the labor of *selection*. It is impossible to overestimate this accomplishment in the racial economy, just as it is impossible to overestimate the specific nobility and loftiness of the ideal heritage they have left to the race.

Those who follow the Greek ways, and, without limiting themselves to old experience, fearlessly, and with confidence in the power of mind, push into the new data of modern life along the path that has proved possible—these are the pioneers; these are subduing chaos and bringing it province by province under the rule of spirit. Those who, refusing to profit by the Greek economy, try old failures again in ignorance or from choice, throw away their heritage. It is only by accident that they may happen upon some worthy thing. Their aberration, generally speaking, takes either or both of two forms, according as they fail to value one or another phase of the Greek accomplishment. Either they deny the validity of the results achieved by selection, and still fancy that "the world is all before them where to choose"; or they deny the right of mind to work selectively at all upon the data of experience, insist that all things are of equal value except as weeded out by

natural selection, and enslave themselves to the crude fact. The first error is the error of modern art, the second that of modern politics—at least, so far as both have been evolved under democratic institutions. The art of democracy is supposed to demand that no forms be rejected as ignoble. The politics of democracy, theoretically allowing free play to the conflicting wills of individuals, each striving for the ends indicated by his "enlightened self-interest," fails to provide for right leadership, for a chosen *mind* to control the welter, and so falls into the gripe of wrong leadership. For a mind of some sort is sure to gain control, soon or late. Modern science has escaped the second error, by selecting from the method of Bacon that part which is Greek in spirit. The Baconian induction, just in so far as it enslaved itself to fact, and disallowed hypothesis, and denied the rights of mind—just in so far as it was un-Greek—was a failure; and just in so far as it "married mind with matter"—to use Bacon's own similitude—was, and is, a success. We are not to be, says Bacon again, like the ant, which gathers and stores up her hoard untransformed by aught that she does; nor yet like the spider, which spins her subtle thread all from within; but rather like the bee, which both gathers from without and transforms from within that which she gathers. Only thus shall we get "sweetness and light."

The Hellenist still believes that, things being given, ideas shall prevail. And so, instead of *fighting* things out, or letting the stress of competing forces among things work out its wasteful end, as Nature does, at dreadful expense of pain, at dire expense of spirit and of life, he endeavors to *think* things out. He may, by international arbitration, substitute the sanction of ideas for the sanction of arms. Or, upon a broad basis of facts, he may build a luminous hypothesis or rise to a law. He may be designing a subway or a city, and planning it so that the work will not have to be done over after the lapse of years. He may raise wages or share his profits not under the compulsion of a strike, but again under the compulsion of an idea—his own idea of equitable distribution. In many ways his mind, dealing with fact, will draw wisdom out of life; in many ways he will reëmbody that wisdom in chosen forms of beauty, and with whatever materials life gives him will make of himself a poet, and of life an art. We leave the subject with a question for those of an inquiring mind: Is our "modern" way of life favorable to tempers of this kind? Do *we* believe in the supremacy of spirit? And would it have been a merit in the Greeks had they been like us?

SAMUEL LEE WOLFF.

FRENCH BOOKS IN LITERATURE AND HISTORY.

PARIS, March 25.

"La Vie et les œuvres de Honoré d'Urfé" (Plon, 5 francs), by Canon O. C. Reure, professor at the Catholic faculty of letters in Lyons, belongs to the generally interesting class of university studies, while setting forth all that trained erudition can tell us of an epoch-making writer in the classic literature of France. Honoré d'Urfé, who fought with the League, and whose grandfather was preceptor of the children of Henry II, was in his life a link between the Renaissance and Richelieu's prelude to the reign of Louis XIV. His "Astrée," in which "by several histories and under persons of shepherds and others are deduced the divers effects of honest friendship," in its 5,000 pages of prose mingled with snatches of verse uttered the French romantic ideals current until Rousseau came to replace it with his "Nouvelle Héloïse." After fifty years, La Fontaine, who was the next mouthpiece of his race's inmost thought, was as much in love with "Astrée" as were its contemporaries.

Agrippa d'Aubigné, the Juvenal of that age according to Sainte-Beuve, was the exact contrary of D'Urfé; he forms the subject of the latest volume, by S. Rocheblave, in the series of Great Writers of France (Hachette, 2 francs). He was a son of the first generation that followed Calvin, studied under Theodore Beza, fought under Henry of Navarre, was three times condemned to death in France without harm to himself, but, after his Universal History "from 1550 to 1601" had really been delivered to the flames (1620), retired to Geneva, where he found means to have his Calvinist brethren condemn him a fourth time to death "for his honor and pleasure." He answered by marrying a second time under their noses. His granddaughter, Madame de Maintenon, did her utmost, which was not little, to drive all Calvinists from France. Agrippa himself had never returned, but died in Geneva in his bed in 1630. His many works, little known, have their "complex unity, their exceptional grandeur" in the man—"for in him all was character."

The second volume, dealing with the seventeenth century, of the "Manuel bibliographique de la littérature française moderne—1500-1900" (Hachette, 4 francs), by Gustave Lanson, professor at the Sorbonne, has just appeared. The work is to comprise four handy volumes, one for each century.

"Alfred de Vigny: sa vie et son œuvre" (Armand Colin, 4 francs), is by Emile Lauvrière, who is already favorably known to American readers from his immensely complete work on Poe. The present book, while based on equal erudition, aims at general exposition and criticism of a poet whose life was as significant as his work. Alfred de Vigny was of that generation of the smaller French aristocracy born in full Revolution; and he was brought up on the old ideas in a world which had changed utterly. He was not, as Alfred de Musset explains of himself, begotten in the interval of Imperial campaigns; but he came to manhood and followed the military career of his ancestors under restored Bourbons who had forgotten what made their greatness in the irrecoverable past and had learned little of the world's present needs. After fourteen years of what he explained eloquently and at length in his "Military Servitude and Grandeur," he found his way as a poet, and, with all his classic form, led the Romantic Revolution at the side of his younger *bourgeois* friend, Victor Hugo. Bonaparte and Byron had equally their spirit transfused into these souls. Vigny had the advantage, not only of knowing English from childhood, but—more doubtfully—that of an English wife. After a few years of renown in poetry, play, and prose writing, which left him a French classic, he retired for thirty years more into his tower of ivory. Sainte-Beuve, who knew him young, accredited the legend of decline. Our author, examining in the light of time which has sifted reputations and brought into relief the poet's person amid his age, treats it as a "glorious decline." He justifies that "prestige of genius which even then imposed itself on poets differing most among themselves—rivals such as Lamartine, Hugo, Musset—as well as on disciples like Leconte de Lisle and Baudelaire, Coppée and Sully-Prudhomme. . . . In his full right he enters into the austere family of Lucretius and Leopardi, of Marcus Aurelius and Pascal; beyond his country's bounds he speaks to the select few, if not to the crowd, of all peoples and every age, his beneficent message of Stoicism tender and proud:

"J'aime la majesté des souffrances humaines."

"John Keats: sa vie et son œuvre" (Hachette, 10 francs), by Lucien Wolff, has the splendid look of a thesis for the doctorate of letters. Naturally it is complete; and it puts in French form much criticism of poetry which Keats has indeed inspired, but which might not occur to English readers of less philosophy. It is accompanied by "An Essay on Keats's treatment of the heroic rhythm and blank verse," in English.

The two remaining volumes of "Etudes critiques sur la vie de Christophe Colomb avant ses découvertes," by Henry Vignaud, are in the hands of the printer and should appear in April. They form two rather stout volumes, which, the author informs us, "is a great deal, but I could not do otherwise. Part of the chapter on Beatriz Enriquez

(mother of Fernando, son and historian of Columbus), which was very long, had to be taken out": this was read at the Société des Américanistes of Paris, January 4, 1910, and doubtless will be published separately. In fact, the question of the legitimacy of the discoverer's union with Beatriz has stood permanently in the way of any serious attempt at introducing the process of his canonization at Rome; here, it may safely be said, Mr. Vignaud's work is exhaustive. A question more important in history, though not in popular feeling, is that of the pilot from whom Columbus had indications of the existence and whereabouts of the New World. It is to be expected that not all students of the history of Columbus will agree with all the conclusions of Mr. Vignaud; but it is certain that no history worthy of the name can henceforth be written without due attention to his complete analysis of all the documentary evidence existing and to his critical examination of it. These studies have been the labor of the leisure hours of the industrious author during his forty years or so as secretary of legation or embassy for the United States in Paris. They suppose a degree of erudition not common in the diplomatic career, but associated rather with independent students like the late Henry Charles Lea. They have involved the patient and costly collection of a large library of Americana, perhaps unique in its line. They are an honor to American scholarship, for Henry Vignaud comes from one of our oldest "native American" families of Louisiana, found there with Bienville two hundred years ago.

"Les Grands Ports de France" (Armand Colin, 3.50 francs), by Paul de Rousiers, is from an author favorably known by his early economic studies of the United States, and by later works on England and Germany. The present book treats in order a subject of vital importance to the maritime prosperity of France: the economic rôle of each of the great ports—Dunkerque, Havre, Rouen, Nantes, La Rochelle-Pallice, Bordeaux, and Marseille—in relation with the surrounding region, with industry and commerce. The general lines of study are explained in forty pages of introduction and may be applied usefully to other countries. The various chapters give valuable information, not easily found elsewhere, on important seaports.

"La Question polonaise" (Armand Colin, 4 francs), by R. Dmowski, with a preface by Anatole Leroy-Beaulieu, presents to the Western world the international claims of the Polish land and race as made by its chief representative in the Russian Duma. Taking up the situation of Poland, after the ineffectual insurrection of 1864, and the progressive transformation of the Poles in Russia, Austria, and Germany, the author formulates the present historic crisis of the Polish question:

The chief danger which threatens the national existence of Poland dwells in the disproportioned growth of German power under the direction of Prussia and in the progress eastward of pacific German conquest. The Polish nation alone is capable of turning aside the danger and staying the onward march of the German tide. But this it will succeed in doing only by intensive labor in all the realms of human activity; it has to develop its national forces so that they may be able to meet the forces of Germanism. The natural ground of such development and labor is the Kingdom of Poland. Now, in the Kingdom of Poland itself, they are made impossible by Russian policy. This policy is but an inexpert imitation of the anti-Polish policy of Prussia; there is nothing to justify it in the interests of Russia herself nor in the designs which she intends pursuing in Poland. Its only result is to benefit Germany and to prepare for German domination in all Eastern Europe.

To upset this system in Russian politics, to bring about a radical change in the relations of Russia with the Poles, is therefore not only the interest of the Polish nation; it is also that of all the peoples threatened by the progress of German conquest, and therefore the interest of Russia as well.

"L'Argentine au XXe siècle" (Armand Colin, 5 francs), by Albert B. Martinez and Maurice Lewandoski, with a preface of twenty-two pages by the veteran statistician Emile Levasseur and an introduction of nineteen pages by the former Argentine President, C. Pellegrini, was crowned by the French Academy at its first appearance. It is now brought up to date and constitutes a handy and complete exposition of the Argentine Republic, economical, agricultural (inventoried at $4,000,000,000), commercial, industrial, and financial.

S. D.

NEWS FOR BIBLIOPHILES.

An important discovery of documents that throw some light on American colonial and revolutionary history, has recently been made known through the publication of the latest report of the Historical Manuscripts Commission of Great Britain. These are the Knox and the Cornwallis manuscripts, now in private hands, but very fully calendared in the report of the Commission. William Knox was for a time provost marshal of Georgia, member of the council there, a landowner who afterward received compensation as a Loyalist, and an agent for Georgia in England. More important still, he was under secretary of state for the colonies, serving under Hillsborough, Dartmouth, and Lord George Germain, a frequent writer on American affairs, and a close friend of men in political life. Few officials in England were more familiar with conditions in America than he, and he was frequently called upon by his chiefs to furnish information, to draft dispatches and letters, and to communicate with other secretaries and departments. Dartmouth left much of the secretarial work to him, and Lord George, though occasionally making alterations in his drafts, seems generally to have accepted his statements without demur. How far Knox and Pownall, his colleague, influenced governmental policy would be an interesting subject for inquiry, and a comparison of this correspondence with the colonial secretary's letter-books would probably throw light on that matter. Knox was intimate with Grenville, North, and Thurlow, wrote frequently to Govs. Lyttleton and Ellis, and carried on an extensive correspondence with George Cressener, the British agent who negotiated the employment of the German auxiliaries on the Continent. The calendar here printed fills more than 200 pages. Admiral Cornwallis was a younger brother of Lord Cornwallis, and served as captain in the navy in American and West Indian waters during the early years of the revolutionary war. He shared in some of Rodney's victories in the West Indies. His correspondence is chiefly of a personal character, the most important letters here calendared being those from his brother, written during 1777-1779, and supplementing in a small way the Cornwallis manuscripts in the Public Record Office.

Two collections of manuscripts of even greater moment for American history than the Knox Papers are to be sold at Sotheby's April 25. They are the property of Lord Polwarth, a descendant of the Lord Chancellor of Scotland, and of Robert Winter Blathwayt, Esq., of Dyrham Park, Gloucestershire, a descendant of William Blathwayt, auditor-general of the plantations, 1680-1717. Both collections are of the highest significance for our colonial history. The Blathwayt Papers alone contain eight hundred letters relating to the original continental colonies and supplement in a remarkable manner the recently discovered Blathwayt Journal, a transcript of which is now in the Library of Congress. Of the entire series only the Randolph letters have been printed. The remainder is composed of correspondence with colonial secretaries and governors of New England, New York, Maryland, Pennsylvania, and Virginia—Allyn, Dudley, Andros, Increase Mather, Phips, Stoughton, Penn, Dongan, Fletcher, Bellomont, Cranston, Calvert, Nicholson, Bacon, Byrd, Culpeper, and others; and among official documents there is the original draft of the grant of Pennsylvania to William Penn, bearing many additions and corrections on the margin. These papers, together with a rich collection of entry books, maps, and miscellaneous documents relating to the colonies, constitute the most important material for our history that has been thrown upon the market for many years. Though some of the Polwarth Papers are manifestly copies, the originals of which exist elsewhere, others of them are no less valuable than are those in the Blathwayt series, while among them may be found a very important collection of pamphlets relating chiefly to trade, dating back to 1674. When it is further stated that the Blathwayt Papers contain above a thousand documents relating to the West Indies, 1683-1710, three large folio volumes of copies of letters patent concerning trade, discoveries, and the plantations to 1706, and other manuscripts throwing light on Newfoundland, the fisheries, relations with the Dutch, 1664-1674, the Admiralty Court, and discoveries in South America, some idea will

be given of the rare and unique opportunity thus held out to purchasers. It is hoped that the British Museum and the Library of Congress will not be found wanting in their duty, as a dispersal of such collections would be a misfortune to our historians.

The collection of engravings (mostly American) formed by the late Edwin B. Holden of New York, will be sold at auction at the American Art Galleries, the sale beginning April 21 and lasting with sessions day and evening for more than two weeks. Mr. Holden had been a collector of books in various departments, autographs, prints, china, medals, etc., for a long time, and his was one of the notable private collections formed within the last thirty years. At the time of his death, in 1906, he was president of the Grolier Club. The portions of the collection now to be sold are the prints, including the most important collections of portraits of Washington and Franklin ever offered at auction, and an extensive series of engraved views of New York city; also the autographs, and the printed books, broadsides, and newspapers relating to American Colonial history and the Revolution. A more extended notice will be given next week.

On April 11 the Anderson Auction Co. will sell part vii of the library of an old New York collector, including a long series of Pickering's Early English Classics, 50 vols.; the Oxford Classics edition of Bacon's works; a complete set of the Darley Cooper, 32 vols.; Crowe and Cavalcaselle's "History of Painting," and other important works.

The Merwin-Clayton Co.'s sale of April 12, 13, and 14 will include a large collection of pamphlets from the library of the late Edward Everett Hale; books on the Revolution, Canada, the Indians, etc.

On April 21 and 22 C. F. Libbie & Co. will sell the library of the late E. P. Jewel of Laconia, N. H., comprising a long series of first editions of the books of Thomas Bailey Aldrich, as well as first editions of other American authors; town histories, genealogies, Confederate publications, etc. The most valuable single item is the manuscript log-book of the American ship of war The Ranger, from August 24, 1778 to May 10, 1780. Paul Jones commanded the ship for a time, but this cruise begins after he had turned over the command to Lieut. Simpson. The volume contains 240 pages.

Correspondence.

AN EDITORIAL INJUSTICE.

To the Editor of The Nation:

Sir: May I ask the courtesy of your columns to call attention to an example of extraordinary editorial ethics to which I have recently fallen a victim? The only organ in Great Britain devoted to the ancient civilizations of the Hither Orient, or Western Asia and Egypt, is the Proceedings of the Society of Biblical Archæology of London, now under the editorship of Dr. Walter L. Nash, a retired physician. In this journal the correctness of a number of essential observations of fact in the temple of Wadi Halfa, contained in my report of the work of the University of Chicago Expedition at this temple, was called in question by Mr. Scott-Moncrieff of the British Museum. I thereupon submitted to the editor photographic prints of the reliefs and inscriptions in question, proving the accuracy of my report, and accompanied them by a text and further photographs (all of which were published in the Proceedings), showing that Mr. Scott-Moncrieff's own examination of the temple was so incredibly careless and incorrect that, besides mistakes and omissions in every line of inscription that he attempted to reproduce, he overlooked whole walls bearing the most important evidence. For example, Mr. Scott-Moncrieff reports that "all traces of the reliefs on the outer northern wall have been removed by the action of wind-blown sand"; whereas this wall is covered throughout its entire length with well-preserved reliefs, of all of which I have submitted photographs to the editor of the Proceedings.

Replying to this exposé in a rejoinder which betrays great irritation and contains highly discourteous personalities, not suppressed by the editor of the Proceedings, Mr. Scott-Moncrieff is unable to introduce any evidence in rebuttal concerning the subject under discussion. Leaving the temple of Wadi Halfa, therefore, the only subject under discussion between us, Mr. Scott-Moncrieff introduces an irrelevant attack upon the translation of the Annals of Thutmose III in my "Ancient Records of Egypt." He accuses me of having inadvertently omitted in five separate places in this translation a total of not less than nineteen words "in five consecutive lines at the opening of one of the most important historical inscriptions there is!" (The exclamation point is Mr. Scott-Moncrieff's and is not intended to call attention to his felicitous English). He adds that plenty of similar omissions in my translation of the Annals can be found by any reader who will compare it with the edition of the original text by Professor Sethe. Having thus produced on the readers of the Proceedings the desired impression of wholesale inaccuracy on my part, Mr Scott-Moncrieff closes with a jaunty reference to "glass houses," etc., etc.

The actual facts will seem incredible to the reader. All of the "omissions" in my translation of the Annals listed by Mr. Scott-Moncrieff as inadvertent errors on my part are carefully indicated to the reader by me in the translation. Each such "omission" in the translation represents a complete gap in the original hieroglyphic document, due to mutilation at the hands of Time, Wear, or Vandalism. Professor Sethe, endeavoring to fill these gaps, in his edition of the text, has inserted editorial restorations—restorations carefully indicated by him as such by means of enclosing brackets. Not a trace of the restored words so inserted by Sethe exists on the original wall, but they are *in toto* conjectural insertions by him. It is the "omission" of these bracketed restorations inserted by Sethe in his text, which Mr. Scott-Moncrieff gravely lays to my charge! Furthermore, Professor Sethe's admirable text of the Annals appeared more than a year after my translation was published, so that it would have been impossible to include his restorations, had I so desired.

Comment on Mr. Scott-Moncrieff's character, or on his experience as an Orientalist, is needless; but what shall we say of the ethical standards of an editor who peremptorily refuses to allow the victim of such misrepresentation any space in his journal for a brief statement of the actual facts? I sent the editor at once a rejoinder which was confined to the facts and contained no personalities. He refused to publish it. I then sent him a very brief statement of the facts of Mr. Scott-Moncrieff's misrepresentations—a statement here reproduced in the preceding paragraph of this letter. He curtly refused to publish it. He edits the sole journal in Great Britain occupying the field of the Hither Orient, and it is well that scholars should know of the treatment which a foreign colleague has received at his hands. It goes without saying that our English colleagues at large are not represented by this standard of editorial ethics; and I have already received voluntary assurance of regret from one English scholar, who wrote as soon as he saw the misrepresentations in the Proceedings.

James Henry Breasted.

The University of Chicago, March 27.

TRAINING IN THE ARMY.

To the Editor of The Nation:

Sir: To any one who will give the subject a little consideration it must be evident that there is something wrong with our regular army. The present authorized force is, I believe, about 75,000 men. This is not a large number relatively to our population, yet there is often much difficulty in keeping the companies filled, and in many cases the recruiting officers are compelled to accept the waifs and strays of humanity; men who, in the battle of life, have failed or are discouraged—and of these they make soldiers. A man once enlisted is provided for very carefully. Everything that ingenuity can suggest is done to amuse him and keep him contented; but, in spite of all this effort, the service is riddled with desertions, and the pursuit of the escaped soldier is a regular part of the business.

An enlisted man, for the term of his service, has every material need supplied. He does not have to exercise his initiative in any way towards the solution of life's first problem, viz., the earning of his daily bread; he is taught absolutely nothing of the arts of peace, and acquires nothing of self-reliance, with the result that he comes to the day of his discharge even more dependent and helpless than when he enlisted, and with the additional handicap of having lost several years of his flexible youth.

To an outsider who watches the strut and parade of an army post it seems as though two hours a day should be ample to teach the men all that is necessary or that they now are taught of war. Is it not practicable to utilize the six hours remaining of a working day to teach them something useful?

The 75,000 men in the army have an average earning power of, say, $400 per year. This foots up to the snug total of $30,000,000. Instead of reducing the earning capacity of these men by a term of army service, and making them less desirable citizens, is it not possible to increase their value to themselves and to society? Here is a suggestion: Establish at every army post a first-class school or college, and employ the five or six hours per day of waste time in the life of the soldier to give him some-

thing of an education in the arts of peace. These schools might be manual training high schools, agricultural colleges, or even technical schools of a higher grade, as found desirable to fit any special locality or condition.

It would immediately be objected that the cost of such a scheme would be prohibitive, but this is not the fact. The operation of such schools need not add a dollar to the present cost of the army service. The common soldier now receives, in money, about $200 per year. If he had the opportunity to get an education on the lines indicated above, his pay could be cut in two and he would still be getting greater compensation than he receives at the present time. One hundred dollars per year saved in the wages of each man would mean, for a post of four companies, the sum of $40,000 per year, an amount more than sufficient to furnish elementary or even advanced education.

With such a system in effect, enlistment could be made a matter of competitive examination, and there would be more applicants than could possibly be accommodated. The canteen question and several other questions would dispose of themselves, and at the end of twelve or fifteen years an army of graduates would be scattered through the country that would make even the Kaiser tremble. Past experience does not indicate that actual war would interfere to any appreciable extent with the working of such a plan, and there would be no difficulty in putting it into effect gradually. AARON M. BURT.

Jamestown, N. D., March 25.

FOR A PARCELS-POST.

TO THE EDITOR OF THE NATION:

SIR: I know of no better evidence of the urgent need of a parcels-post system in the United States than the experience of an institution like the Wisconsin Historical Society with the express companies of this country. Once or twice each year we make a shipment of about 1,000 packages of books—Proceedings, Collections, or other publications of the society. For many reasons we should prefer to patronize the post office, but two obstacles confront us: First, in order to attract patronage, the express rate is purposely made somewhat lower than the postal rate, and we naturally desire to economize; secondly, the Post Office Department declines to receive packages weighing above four pounds, and our parcels are likely to exceed that.

The express companies are commonly supposed to be models of efficient business administration. But the supreme test of efficiency on the part of a high-priced transportation agency, is the getting of the package into the hands of the consignee. Herein, the postal department, now upon the grill for laxity of business methods, rises far superior to its rival; its officials certainly do "deliver the goods," and spare neither pains nor ingenuity in doing so.

On the other hand, the express companies (they are all alike in this respect) resort to slipshod methods, apparently employ as delivery messengers the most incompetent service possible, and after a single trial "give it up," should there be the slightest difficulty in the way. Then comes into play an elaborate and doubtless costly system of notifications through whole series of officials and sub-officials, until finally the consignor is informed by the local agent that his correspondent "cannot be found." This model business machine then rests complacently until the consignor ingeniously suggests that perhaps No. 445 had best be tried, seeing that No. 443 is under repairs and closed; that Hon. R. F. Smith of Podunk should probably read Hon. R. T. Smith; or that "The Historical Society, Wilmington, Del.," should read "The Historical Society of Delaware, Wilmington, Del.," the latter an actual case in point, the correspondence relating to which lies on my desk at this writing.

I do not think that any large shipment of packages of this character ever went forth from our institution, but some thirty or forty cases, at least, came up, wherein nothing but rank stupidity on the part of express company employees could account for the trouble; for in nearly every case, our consignees are either individuals of considerable local prominence, or learned institutions that might readily be found by the newest arrival in town. Once, we were curtly notified that "Hon. Seth Low, New York city," "could not be found," and yet at that moment he doubtless was sitting in the mayor's chair at City Hall.

Performances of this character, persisted in year by year, are far from creditable to great corporations which perniciously and persistently throttle proposed reforms looking to a parcels-post. If they would but seek to rival the Post Office Department in efficiency, more might be said in favor of their contention.

LOUIS NAPOLEON AND THE TEACHING CLERGY.

TO THE EDITOR OF THE NATION:

SIR: I recently had occasion to discuss for an American review F. A. Simpson's new volume, entitled "The Rise of Louis Napoleon." The book makes passing mention of a letter written by that enterprising public character to the provincial French newspaper *Le Progrès du Pas-de-Calais* from his prison at Ham in 1843, concerning the educational work of the Catholic Church in France. The remarkably shrewd and just observations of the young emperor-to-be on a question that, just as he foresaw, is now dividing France (and incidentally endangering the national integrity of Spain), are worthy of serious consideration by all friends of the church and of good government as well. An English translation of the letter appeared in Louis Napoleon's collected works (first English edition, 1852), and, with the help of some additional information kindly furnished me by the brilliant young Englishman to whom we owe the new book, I am able to outline a most interesting discussion.

It will be remembered that Louis had spent a large part of his youth in Augsburg, which gives him the authority of one who speaks with full knowledge, not merely of the dangers of the French system, but of the merits of the German method, which he approves.

It is right, he says, that the clergy should teach Christianity to the children, and it is right that they should do so under government protection; for disestablishment would leave the church schools to live by their wits, and would encourage interested trafficking in sacred things. On the other hand, it is necessary that public instruction, with all other branches of public activity, be pursued under the direction of the secular government. But the church cannot remain free to teach the rising generation hatred of liberty, as that organization is inclined to do in France. How is this to be prevented? By giving the clergy the proper education; they must be made to "study science as of old, and to be with and of the people, by drawing their education from the same source as they." That this measure will result in substantial harmony of views between the church and the secular government is shown (I am reporting Napoleon) by conditions in the South German States, where the future priests study theology in the universities along with the candidates for other professions, and so "learn to be citizens before they are priests."

Louis says of the German priests:

> There are no sacrifices from which they would shrink for the cause of liberty and the fatherland. In their eyes to be a priest is to teach morality and charity; it is to make common cause with the oppressed; it is to preach justice and toleration; it is to preach the reign of equality; it is to teach men that the political redemption should follow the religious redemption.

If this state of affairs could be brought about in France, a truly ideal condition would follow the application of Christ's own teaching:

> The sublime doctrine which destroyed slavery, which taught men that they were equal, and that God had implanted in their breasts a faith to believe in good and a love to be extended to one another.

Barring the somewhat enthusiastic conclusion—which is interesting, but scarcely in tune with Napoleon's own practice or uniformly with that of the German clergy—have we not here an astonishingly true presentation of the real difficulty and the best solution? However unconvincing a comparison may be between countries so differently governed as Germany and France, is it not certain that atheism or piety, republicanism or monarchism, is very largely, perhaps principally, a result of the education received during the formative period?

MEDIÆVAL MEDICAL SCIENCE.

TO THE EDITOR OF THE NATION:

SIR: I cannot understand how anybody can deny, after the works of Spengel, Haeser, Pagel, and others, that the medical science of the Middle Ages was beneath contempt. Pagel says that it represents "the highest degree of sterility," at least in western Europe; the Byzantines and the Arabs knew a little more, because they had preserved something of the Greek tradition. "Monastic Medicine," writes Pagel, "is a document of the decadence of knowledge in its most distressing form." The fact that there were hospitals and doctors during the Middle Ages is no proof of the existence of a science worthy of that name. The School of Salerno owed its superiority to the fact that Greek influences had been kept alive in that south Italian town, and also to the lay character of the professors; but even there not one positive progress was made.

The medical science of the scholastic period depends entirely upon Arabic and Jewish learning, which, after all, was of Byzantine origin, and, as far as it was not absurd, purely Greek. The "Speculum Naturale" of Vincentius Bellovacensis (1290) gives an idea of the ignorance of the age. To conclude with a quotation from Pagel: "There is no doubt that the sixteenth century found the study of medicine, and particularly that of anatomy and physiology, exactly in the same condition where it had been left in the third century." Mondino de' Liucci (†1326) was the first Christian who dared to dissect a human body—ten centuries after the triumph of the Christian church over paganism! No amount of reasoning or of sophistry can prevail against that stubborn fact. Not only were the Middle Ages times of darkness and ignorance, but of filth, disease, and untold misery. There is still a good deal of mediævalism lurking in the world, and where some of that poison remains, misery, filth, and disease are endemic, not to speak of some evils of an even worse kind, such as indifference to truth and hatred of reason. SALOMON REINACH.

Paris, March 22.

THE HERALD IN "HENRY V."

TO THE EDITOR OF THE NATION:

SIR: Professor Bruce points out in your issue of March 10 that Professor Wallace is mistaken in saying that Shakespeare "also honors his host (Christopher Mountjoy) by raising him in the play ('Henry V') to the dignity of a French herald under his own name of Montjoy." Professor Bruce proceeds to say that "Mountjoy" or "Montjoie" was already the name of the Herald in Holinshed's "Chronicle," which was Shakespeare's source for this play. Your correspondent, like Professor Wallace, evidently considers Mountjoy as a personal name. It was, in fact, the designation of an office, that of Chief of the Heralds. From the thirteenth century this officer was called in France "Montjoie roi d'armes."

Those who are interested in such matters may find an illustration of the practice of giving names to the heralds which has lasted in England from the Middle Ages to the present day. In the London *Times*, weekly edition, February 25, 1910, in the account of the opening of Parliament, occurs the following passage:

> The Royal Procession entered the Chamber a few minutes past two o'clock. The Pursuivants and Heralds came first, pacing slowly in their gold and crimson Tabards. Bluemantle and Rouge Croix walked side by side, and Rouge Dragon followed with Portcullis.

SELF-GOVERNMENT.

TO THE EDITOR OF THE NATION:

SIR: According to press reports Col. Roosevelt told the Egyptian Nationalists that they were not at present fitted for self-government, but that possibly they might be in time. This view of the situation seems to have surprised and disgusted them, as might have been expected, suckled, as they are, in a creed outworn; but the really surprising part of the whole affair is that so much of the American press takes the colonel's views as a trite commonplace, an axiom needing no proof. The ex-President may not have made a serious contribution to political science in proclaiming that all men are not equally fitted for self-government; but the incident may well be taken as marking one of the milestones in the road towards political sanity, as he undoubtedly represents the average intelligent opinion. The Filipino we believe to be incapable of decent self-government; the Porto Rican has yet to show us that he is fit; we have our suspicions of the Cuban, and it is an open secret that we regret giving the ballot to the negro without qualifications. We know that the colored brother is virtually disfranchised in many parts of the South, and we acquiesce, or at least we do not exhibit that hot indignation we should have shown half a century ago. Time-honored political shibboleths are challenged and comprehensive social formulas are doubted. "Fraternity" we still embrace —platonically; "liberty" we view askance; but "equality" we repudiate outright. From the point of view of political evolution Roosevelt's Egyptian campaign is highly significant. E. L. C. MORSE.

EAST AFRICA.

The Land of the Lion. By W. S. Rainsford. Illustrated from photographs. New York: Doubleday, Page & Co. $3.80 net.

Hunting in British East Africa. By Percy C. Madeira. With a foreword by Frederick Courteney Selous, and 129 illustrations from photographs by the author. Philadelphia: J. B. Lippincott Co. $5 net.

In the Grip of the Nyika. By Lieut.-Col. J. H. Patterson, D.S.O. With illustrations. New York: The Macmillan Co. $2 net.

In Wildest Africa: The Record of a Hunting and Exploration Trip in East Africa and a Description of the Various Native Tribes. By Peter MacQueen. Illustrated. Boston: L. C. Page & Co. $3.

Through Uganda to Mount Elgon. By J. B. Purvis. With a map and 42 illustrations. New York: American Tract Society. $1.50.

Native Life in East Africa. By Dr. Karl Weule. Translated by Alice Werner. Illustrated. New York: D. Appleton & Co. $4.50 net.

East Africa is attracting attention today as never before; principally, of course, because it is the great hunting-ground of the world. In no other country can one travel by rail for hundreds of miles through what is practically a zoölogical garden; where a train can be stopped by an inquisitive giraffe breaking the headlight of an engine, and a lion can take its prey from a sleeper. But this is not the only cause of the present interest. Every sportsman and traveller is emphasizing the fact that nowhere else are there such vast tracts of rich but undeveloped land, capable of raising not only all tropical products, but those also of the temperate zone, and easily accessible to the world-markets. Considering the extensive plantations already established, one is justified in the belief that as a field for sportsmen its days are numbered, and that as a cotton-growing region alone it will probably in the not very distant future outrank every other country. Then an inexhaustible source of interest is found in the natives, ranging as they do from the forest pigmy, nearest the brute, to the civilized Baganda. From this diversity they present perplexing governmental and educational problems to their German and English rulers. These the German Government is zealously endeavoring to solve, by experimental stations for tropical culture and cattle-raising, industrial training schools, the construction of roads and railways, and by sending scientific expeditions for the exploration of the colony and the study of the inhabitants. Things are different in the neighboring territory, if we may trust the evidence of the *Star*, one of the three weeklies of Nairobi, the capital. Some time ago it published a supplement consisting of a pamphlet of sixty-four pages, on the outside of which was printed in large type the words, "What the British Government is doing for East Africa." Upon opening the pamphlet the other pages were found to be blank.

The natural result of this awakened interest is the great increase of literature, both magazine and book, with a wide range from the stories of hunters' exploits to reports of the work of explorers, ethnographers, and missionaries.

The most noteworthy of these recent books in many respects is the "Land of the Lion," by Dr. W. S. Rainsford, former rector of St. George's Church in New York. It is the narrative of a trip in British East Africa made in 1908, during which Dr. Rainsford walked and rode more than 5,000 miles—his aim being, not killing, but hunting. To the account of each day's experiences, written generally in camp and so having a vivid freshness, there is joined much valuable information for those intending to follow him and Mr. Roosevelt, whether man or woman. For women hunters are to be found there now, enduring the strain and braving the dangers of the big-game quest. Dr. Rainsford gives most precise directions in regard to the necessary preparations for the make-up of the "safari" (as these hunting parties are called), and useful hints as to the safest way to hunt the various animals. In a chapter entitled a "Plea for the Native" he characterizes those untouched by civilization as "simple, truthful, and most lovable peo-

ples." In thirteen months' daily marching among a band that generally numbered a hundred men he knew of only one serious quarrel. What they need most is instruction in the simplest religious truths, industrial education, and to be "firmly, lovingly *forced to work*." (The italics are his.) The lack of a well-considered policy on the part of their English rulers is emphasized, and the granting of large concessions of land to what are virtually speculators is condemned. The immigrant Boer he calls "an unmixed nuisance," and of the Indian he says that "economically he may be a convenience, but morally he is a curse. The account of his hunting adventures occupies, of course, the main part of the book, and, notwithstanding the similarity of conditions and incidents, will prove of unfailing interest at least to the keen sportsman. As a lion-hunter he ranks high, having shot "four lions in three days, seven shots to the four, not so bad." The most difficult trophy to get, and, in his opinion, the finest of all, is the buffalo head.

Percy C. Madeira's "Hunting in British Africa" is the story of another sportsman's experiences told in a modest and entertaining way. In a trip of only three months, he was able to obtain specimens of thirty-five different animals, including all the big game, except the elephant, for the shooting of which he could not get a permit. Useful information is given in regard to the outfit of a "safari" and the safest way of tracking the game. The constant dangers to which the hunter is exposed are very clearly shown. One never knows, he says, "from one moment to another what the next bush, shadow, or tree may hide. The innocent-looking rock lying in the grass twenty or thirty yards from you may become a pugnacious rhinoceros; the silently stalking buffalo that has watched your approach, unseen by you, may suddenly charge out from the shadow of a tree; a lion may start up from the cover of a bunch of grass or a bush just ahead of you—all of which render it a matter of keyed-up attention that is not, I imagine, approached in any other country." With him, it may be added, as with Dr. Rainsford, "the charm lies in the fascination and excitement of the chase, with the killing alone to be regretted." There are many interesting descriptions of the country passed through, and of the natives. The loyalty of his followers to him, and especially to his wife, who accompanied him, was such that he was "sure they would have given their lives to protect her; and she had the same confidence in them." Referring to the custom of perforating the ears and stretching the holes in the lobes, he says that he has seen natives "take the lobe of one ear over the top of the head and loop it under the ear on the other side." Among his specimens, whose mounted heads are shown in the frontispiece, was the dikdik, the smallest of all the antelopes, standing only fourteen inches high at the shoulder, and weighing about seven pounds, which burrows underneath the deep grass and creeps and crawls along like a rabbit.

Another evidence of the fascination exerted by this hunter's paradise is the title which Col. J. H. Patterson, author of the well-known "Man-Eaters of Tsavo," has chosen for his new work. This is the story of his trials and adventures during two recent expeditions in the *nyika* or wilderness, the one for hunting simply, the other primarily for determining the eastern boundary of the Northern Game Reserve. In each his party included a woman hunter, whose success in securing big game was remarkable. As the husband of one of these women was killed during the second expedition, and the author himself was stricken with fever and wrote his book while still suffering from its effects, a minor key naturally runs through the narrative. In the main, however, it possesses interest on account of the exciting adventures recorded, among which was an encounter with a rogue elephant and a thrilling night spent in a bush-shelter besieged by lions. "The weirdest sight," he could ever wish to see, to use his words, was sixteen rhinos "all roaring at each other and struggling and fighting in their efforts to get at a water-hole." The boundary work carried him into a virtually unknown region, where the natives were a constant source of danger. It is for this reason that a tract some thirty-eight thousand square miles in extent has been made a reserve, because as yet there is no "effective control" over the inhabitants. They are largely Masai, and in his description of them he tells of one the lobes of whose ears "hung down in two long tassels over his shoulder. When they got in his way too much, he used calmly to take hold of the two ends and tie them up in a knot!"

There is a wider range in the Rev. Peter MacQueen's "In Wildest Africa," as his aim was, not so much sport, as the gathering of material for lectures and a book. He travelled through British East Africa, crossed the frontier into the German possessions, and climbed nearly to the summit of Kilimanjaro (being the first American to make the attempt), voyaged on the Victoria Nyanza, and skirted the southern part of Uganda to the "fountains of the Nile" or the Ripon Falls. To a disconnected narrative of his personal experiences he adds much historical and ethnographical information in regard to the country and its inhabitants. On account of the great undeveloped natural wealth of Uganda he predicts for it a highly prosperous future, notwithstanding the present terrible plague of the sleeping-sickness. He visited one of the six great hospitals established by the British authorities, at which seven hundred patients were cared for. At Kampala, the capital, he had an interview with the king, Dauda Chwa, "a graceful distinguished looking lad, twelve years old, . . . who talked to us in English. He was greatly interested in America, and in the coming visit of ex-President Roosevelt. He showed me a map of Uganda he had himself drawn; and upon it he had marked the places where the best elephants could be shot. He seemed a little shy at first, but this shyness gradually wore off. He had a plaintive, sweet voice, and usually expressed his interest or admiration by saying in a boyish treble, 'Oh, yes!'" Another interesting interview was with Ali ben Hamoud, Sultan of Zanzibar, a young man of twenty-two and a graduate of Eton. "He rose and shook hands with us and ordered coffee and cigarettes to be set before us. Almost his first words were: 'I am greatly interested in your big country and planned to visit the United States last year. I was not able to go at that time, but I am going to America as soon as I can make my arrangements.'" Many entertaining stories are told, and there are graphic pictures of life in the towns, on the ranches, and in the bush. Referring to the practice of piercing the ears, he says: "I actually saw a man with a condensed milk can in one ear and a jar of Liebig's extract of beef in the other."

"Through Uganda to Mount Elgon" is much more than a mere book of travels. It is really a plea for the East African native by one of his best friends, an English missionary. After some years' absence Mr. Purvis returned to his work in Uganda, and in describing his journey thither calls attention to the changes which have taken place in the conditions and character of the people, chiefly through the building of the railway. He criticises the government policy, or rather want of policy, in respect to the natives, and advocates strongly giving an industrial education and making the watchword not revenue, but the "development of native resources for and by the native under European supervision." The most interesting part of his book is that in which he tells of his work in the Mount Elgon district among natives the farthest removed from the new influences. Sir H. H. Johnston, the leading authority on these tribes, says they are "perhaps the wildest people to be found anywhere within the limits of the Uganda Protectorate. They are wilder even than the Congo dwarfs." Nevertheless, Mr. Purvis found in them "a charming lightheartedness, breezy ge-

niality, and kind good nature." Another wonderful fact is that women are very much respected, and that the men help to cultivate, being responsible for the "cultivation of all cereals, whilst the women are responsible for the plantain groves." An important part of Mr. Purvis's work was the preparation of a grammar and of a dictionary of ten thousand words, which, however, form but a portion of the native vocabulary. One great difficulty in teaching them is the almost total lack of words to express abstract ideas, as love, grace, faith, trust, holiness, etc. For this last word in especial their language has no equivalent, but they grasp the idea quickly and express it by *kikosefu*, "cleanness or whiteness."

In 1906 a government research expedition was sent to German East Africa, the ethnological and sociological work being entrusted to Prof. Karl Weule of the University of Leipzig. In addition to his published official report he has given in his "Native Life in East Africa" a narrative of his personal experiences, together with much of the information gained during the six months spent in the southern district of the colony. He took every occasion to see the natives in their huts, at their daily occupations, and especially to be present at their songs and dances. Having a camera, a cinematograph, and a phonograph, he was able to secure many valuable pictures and records. At one place, after the singing had ceased, he reproduced some of their songs, to the measureless and joyous astonishment of the brown chorus. When he had finished, "two women, who had previously attracted my notice by their tremendous vocal power, as well as by the elegance of their attire, came forward again; and, as the crowd fell back, leaving a clear space in front of the phonograph, first one and then the other approached the apparatus, dropped a curtsey in the finest court style, and, waving her hand towards the mouthpiece said, '*Kwa, heri, sauti yangu!*'—'Good-bye, my voice!'" The most valuable part of his contributions to our sociological knowledge of the natives is his carefully detailed account of the *unyago*, the ceremonies at the coming of the boys and girls to the age of puberty, which includes the circumcision of the boys. During this period they are kept in separate isolated camps and are instructed by mothers and specially appointed teachers in the rules of conduct and hygiene. "The behavior of young people to their elders in general deserves to be called exemplary." Among their games he found four kinds of tops, one of which corresponds to our peg-top and the diabolo. He also got "two charming specimens of an African telephone, consisting of two miniature drums, beautifully carved and covered with the delicate skin of some small animal, perforated in the middle to allow the passage of a thin string, which is kept from slipping through by a knot on the inside of the skin." A picture is given of two children talking through it, the string being about a hundred yards in length. He found the natives very fond of drawing, and he reproduces one striking fresco found on the wall of a hut, together with many pictures drawn by the natives at his request. The value of the book is increased by the fact that the translator is professor of Zulu at King's College, London, and the author of several works on the African races. To her admirable translation she has added many valuable notes, in which some errors in Professor Weule's conclusions are corrected and much additional information is given.

CURRENT FICTION.

A Mine of Faults. Translated from the original manuscript by F. W. Bain. New York: G. P. Putnam's Sons.

In this volume, Mr. Bain, by official occupation principal of the Deccan College, Poona, has given us another of the charming stories introduced some years ago by his "Digit of the Moon." The present tale tells how woman, being, indeed, a "mine of faults," is, for that very reason, only the more adorable; "if women had no faults, half their charm would disappear." In true Indian fashion, the story is represented as related by Çiva to his wife. Once upon a time, there lived two kings, one having a daughter and the other a son. But these kings were hereditary foes, and the son threatened the country of his father's rival, who was utterly helpless before this peril. The young prince was a most thorough misogynist of the brave theoretical sort, able to prate finely about the shortcomings of all feminine kind. Against him is brought, by the minister of the imperilled kingdom, the foe that the invader had mocked, and before the "mine of faults," the mighty warrior is helpless.

The story, thus baldly outlined, must be read for its beauty to be appreciated. The princess, delicate and charming as she is crafty, awakens in Chand the love that he had scorned. And the development of this love is set forth, swiftly indeed—for in India love is ever at first sight—yet without a single false note. But Love wins a double victory, and herein lies one of the most delightful aspects of the tale. For the princess plays with the coolness of a master hand on each emotion of Chand, feeling none herself, aiming only to conquer him for the safety of her father's realm; until, at the last, the perfidy of her rôle overpowers her, in the face of Chand's devotion, and she reveals the plot. More than once, the psychology of love is touched upon with nice discrimination:

> The tests of love are only two, the power of recollection and the capacity to forgive. For false love forgets at once, and cannot forgive at all. But love that is really love forgives forever, and never forgets.

In beauty of diction and wealth of description the story is characteristic of Sanskrit literature at its best. Thus the princess is described:

> . . . all unconscious of her own inexplicable charm, like a great blue lonely lotus-flower growing on a silent mirror of black water in an undiscovered forest pool, never even dreaming of looking at its own reflection in the water, towards which all the time it bends, as if to kiss it.

The Sanskrit device of paronomasia lends a special Indian enchantment to this exotic story, though it is the current fashion for Occidentals to object to this form of embellishment. Thus, "so great was his pleasure in its recollection," (p. 57), also means, punning on *smara*, "love, recollection," "so great was his pleasure in love of it [the mind-picture of the princess]"; I "will do what I can, in my weakness" (p. 84), may also mean "I will do what I can, as a woman," punning on *abala*, "weak, woman"; and "bee" (*bhramara*) in "are not all bees naturally rovers, and hard to satiate?" (p. 113) also means "lover."

The "Mine of Faults," like Mr. Bain's previous works, is declared on the title-page to be translated from a (Sanskrit) manuscript. Reviewers have, without exception so far as the present writer knows, denied this, holding that Mr. Bain is himself the author. It is true that his writing contains some Occidental touches, though, perhaps, the need of occasional adaptation to the general public might be urged in explanation of this fact. It is also true that the Sanskrit titles which he gives as the original designations of his stories are not to be found in catalogues of Sanskrit manuscripts; but neither are a number of indubitably genuine productions which are duly edited in the Benares Sanskrit Series, and elsewhere, to say nothing of works hitherto unknown which are frequently discovered in Indian libraries. The present reviewer, who has studied Mr. Bain's writings for a number of years, and specialized to some extent in Sanskrit romance, feels unable to join in the opinion that these stories are not just what they claim to be. At all events, he has repeatedly said that if they are translations, they are wonderfully good; if they are original, they are still more marvellous.

Strictly Business. By O. Henry. New York: Doubleday, Page & Co.

Twenty-three new stories from the unsleeping pen of our Fielding *à la mode*—twenty-three racy chapters added to his encyclopædic account of the impudence, the energy, the recklessness, the vulgar loves, the fat and cynical materialism of proletarian America. Such are the themes of these varied

tales, addressed—to quote their maker—"to the man who sits smoking with his Sabbath-slippered feet on another chair, and to the woman who snatches the paper for a moment while boiling greens or a narcotized baby leaves her free." It is difficult to understand why this Sabbath sybarite and this troubled housewife do not prefer Boccaccio and the "Arabian Nights," unless they hold with Lucretius that it is sweet to contemplate from the window of a sky-scraper the roaring tumult of Broadway. The reeking realism of the presentation is, contrary to received theories, rather intensified than diminished by O. Henry's growing fondness for commenting on his characters, his style, and the conduct of his plot. He appears to be spurning technique in the interest of the facts that come pelting at him. He obviously finds the much-advocated pure objectivity of the short-story something of a nuisance when he wishes to converse with his readers. Frequently hovering on the borders of philosophic digression, in "A Night in New Arabia" he steps boldly into a little essay on modern rich men, admirable for its nice distinctions: "The capitalist can tell you to a dollar the amount of his wealth. The Trust magnate 'estimates' it. The rich malefactor hands you a cigar and denies that he has bought the P., D. & Q. [superb characterization!] The caliph merely smiles and talks about Hammerstein and the musical lasses."

With a satirist carrying such a quiver, it is pleasant to tarry by the wayside and applaud his marksmanship. The stories in this volume show the glaring inequalities of verve and invention to be expected of a writer who exacts of his art the regular and diurnal fecundity of the journalistic Muse. But among several yarns betraying strain and pedestrian inspiration there are three or four of first-rate quality: the title story, "A Night in New Arabia," "Proof of the Pudding," and, perhaps best of all, "A Municipal Report." In the last, with the article on Nashville, Tennessee, from Rand & McNally doing strange service as ironical Greek chorus, he produces a little tragic drama of decayed Southern gentility, proving, in defiance of Frank Norris, that New York, New Orleans, and San Francisco do not monopolize the romance of real life. The effect is novel, and the pleasure is dependent upon the intrinsic interest of the matter as well as upon the artifice of presentation. Such work makes the reader hope that O. Henry may sometime have leisure to do his best more frequently.

Hopalong Cassidy. By Clarence E. Mulford. Chicago: A. C. McClurg & Co.

In this narrative of cowboy life in the arid Southwest, Cassidy of the saltatorial prenomen is hero only by courtesy. Half-a-dozen of his fellow-ranchmen speak as much, ride as hard, and shoot as frequently and as effectively as Cassidy. It was only the exigencies of the novelist's trade that impelled our writer to pitch upon one of the large number of cow-punchers that crowd his pages and make Cassidy the recipient of the hitherto untried affections of the pretty young daughter of the foreman of the ranch of which Cassidy's own ranch was the neighbor and rival. After a few tentative bits of love-making our author throws the girl frankly overboard, and sets out to tell how a handful of stout-hearted cowboys besieged a band of cattle-thieves on top of an inaccessible mesa. This part of the book has a sort of primitive interest. But until this part is reached, the story does not move at all, but hops along amidst a great deal of gun-play and local slang. There are indications that the writer has worked from close personal observation, and his talk is somewhat more natural than the average brand of Far Western dialects. But the treatment is amateurish and confused.

The Personal Conduct of Belinda. By Eleanor Hoyt Brainerd. New York: Doubleday, Page & Co.

An amiably silly story of a tour in Europe personally conducted by an enslaving young woman whose senior partner is at the eleventh hour prevented from taking her accustomed post. The composition of the party, its inter-relations, and international adventures, are mere farce. Yet gleams of England, Touraine, and Brittany, however fleeting, bring the inevitable, inalienable charm which covers a multitude of farces. The school-girl view of sight-seeing is worthily caricatured at the hands of the pink-and-white Amelia; but the rest of the comic relief does not conspicuously relieve. Nevertheless, in the foolish unreasoning hour a worse companion may be found than this book of improbable characters and impossible situations. To read it is aviation, but no bones are broken.

A HISTORY OF KENTUCKY.

Kentucky in the Nation's History. By Robert McNutt McElroy. New York: Moffat, Yard & Co. $5 net.

Since this book represents, in the language of Professor McElroy, "a conscious departure from the customary method of dealing with State history," it is but fair that the theory upon which it has been constructed should be stated in the author's own words:

> The real aim of the study of State history, as I conceive it, should be to add to our knowledge of the nation, as the day for the cultivation of a purely local patriotism—if, indeed, that day ever existed—has passed forever. To write of the history of a State as though it were something apart from the nation is not only to violate the "unity of history," but also to deprive the nation of a valuable source of information concerning national events.

Conceding, as we readily do, that the writing of State history has too often proceeded upon antiquarian rather than historical lines, and that the affairs of the nation must always possess a larger interest than those of any of its constituent members, we nevertheless are compelled to think that the dictum above quoted not only fails to give the whole truth of the matter, but also involves some confusion of thought. For one thing, it implies, with almost brutal frankness, a degree of centralization *in posse* which, thank Heaven, has not yet come about even in these days of expanding Federal power. Moreover, so long as the American Union is constituted as it is, the several States composing it will continue to enjoy the right to lead lives not wholly overshadowed by the life of the nation; nor will they, we think, be deterred from doing so by fear lest thereby they "cultivate a purely local patriotism." Unless, then, the conception of "national" history is to be given such unusual extension as to make it include a summary of all that is going on in all the States at any given time—an extension which would obviously make the writing of the history of a federal government almost insuperably difficult—there will always be this parallel progression of nation and State; and the historian, bound to record what he finds rather than what he fancies ought to be, will not deem it necessary to depreciate the one in order to exalt the other.

Further, Professor McElroy seems not to have apprehended clearly the relation of an American State to the life of the nation of which it forms a part. A State is always played upon by two forces. On the one side is the nation, drawing it, whether it will or will not, into the current of national progress, moulding its thought and conduct by the silent power of a common law and a common opportunity, and commanding, at critical moments, its almost exclusive allegiance. On the other side is a host of purely local circumstances, not only dissociated in the public mind from concern for the national welfare, but also, as it happens, expressly reserved for State consideration by the Federal Constitution. Professor McElroy seems to regard the former of these two influences as the only one really worth while; unmindful of the fact, seen only the more clearly as the history of the States comes to be studied, that it is the condition of the public mind bred by local experiences and needs, quite as much as any public opinion developed by contact with the national life, that determines the fundamental attitude of a State towards national issues.

The reader, accordingly, who seeks to discover here the part played by Kentucky in the making of the American nation, will find only a portion of the story told. He will, indeed, learn, more fully than anywhere else, how Kentucky treated such distinctly national problems as were presented to it; but he will look in vain for an orderly account of the influence of Kentucky in formulating those problems, or for explanation of its fundamental attitude towards them. Of the life of the people, the nature and development of their government and law, their lines of political cleavage, what they thought of slavery and abolition, their problems of economic advancement (save in a single important instance), and their general cultural interests, Professor McElroy tells us little, and that only incidentally. "Kentucky in the nation's history" becomes, for him, a panorama of politics and war, a series of occasions in which the nation, mainly, be it remarked, for reasons not of Kentucky's choosing, enters the Kentucky field.

The list of topics of which the several chapters treat is the best illustration of what has just been said. Beginning with an account of the early westward migration, we have next an interesting sketch of Transylvania, "the last experiment in proprietary government," of Kentucky's share in the Revolution, and of the steps by which it entered the Union. Down to this point the author gives us real State history of a solid and commendable sort. Thenceforward, however, Kentucky is "nationalized." The remaining chapters, comprising four-fifths of the book, deal with the military adventures of Harmar, Wilkinson, and St. Clair; with Genet's intrigue, the struggle for free navigation of the Mississippi, and the acquisition of Louisiana; with the Burr conspiracy, the Kentucky resolutions of 1798 and 1799, and the War of 1812; the disastrous experience with State banks and paper money; the Mexican War and the repeal of the Missouri Compromise, and the successful resistance to secession. Necessarily, these chapters are pretty closely connected, but they are nevertheless only a series of essays on the most important subjects in which national interests come in contact with those of the State.

While, however, we feel compelled to dissent from the theory of State history to which Professor McElroy commits himself, the specific substance of his volume calls, in general, only for praise. Use has been made, not only of the older printed sources, but also of the unrivalled collection of Kentucky material, some of it in manuscript, made by Col. Reuben T. Durrett of Louisville. The chapters on Transylvania, the Burr conspiracy, and the War of 1812, and the account of George Rogers Clark gain freshness, detail, and accuracy from the use of this new material. Military historians will be interested in the author's explanation, apparently convincing, of the part played by the Kentucky volunteers at the battle of New Orleans, and his refutation of Jackson's hasty charge of cowardice. The chapters on Kentucky finance and the exciting events of 1860-61 are especially well done; while that on the resolutions of 1798 and 1799 makes still clearer the fact that the nullification for which Kentucky then stood was not, as later in South Carolina, a claim of right to be asserted by any one State for itself, but only by the States collectively. The closing words of the resolutions of 1799 are a protest, not a threat.

It is unfortunate that, in a book which, with all its limitations, is nevertheless a valuable addition to American historical literature, certain details by which one judges of a scholar's carefulness should not have been better attended to. Although authorities are freely cited, the form of citation is singularly variegated. Substantive statements of the text are quoted, now from semi-popular narratives like Fiske's "Critical Period" or Irving's "Life of Washington," now from such standard writers as Schouler, McMaster, or Von Holst, and now from manuscripts or early printed books. State documents are cited from newspapers, Federal statutes from the *Congressional Globe* or somebody's monograph, and the first Kentucky Constitution from the Durrett manuscript. "Hildreth's 'Second Series'," "Babcock's 'American Nation Series'," "Johnston's 'History of American Political Parties'," and "Bourne Essays," are among the vagaries of which scholars, and even undergraduates, will make note. In a number of statements of a general nature the text shows inaccuracy; and certainly *The Genius of Universal Emancipation* ought not to be linked with the *Liberator* as a "Garrison publication." Lastly, it should seem as though the combined efforts of author and publisher might have rid the volume of its erratic punctuation.

Masters of the English Novel: A Study of Personalities and Principles. By Richard Burton. New York: Henry Holt & Co. $1.25.

With Prof. Richard Burton's plan for an examination of "Masters of the English Novel" as expressed in the words of his preface—the study of eighteenth-century "beginnings" and "developments," of Jane Austen and Walter Scott, of the French Influence, of Dickens, Thackeray, George Eliot, Trollope, and others, of Hardy, Meredith, Stevenson, and the American Contribution—we are in fullest sympathy. One would very much like to conclude that Professor Burton had taken full advantage of his opportunity, and that his views, if not remarkable for novelty, were at least safe and sane. But one regrets, first of all, that the successive chapters somehow fail to "pull together." And many of the details cause even the best-intentioned reader to doubt. For instance, is not the character given here of Fielding the man rather the old-fashioned one, somewhat shattered by later critical biographers, than that which one may fairly expect from an enlightened cicerone like Professor Burton? The lover of Jane Austen takes it ill, also, that a superficial criticism of his favorite should condemn the "plain speaking in her books, even touches of coarseness," echoing "the rankness which abounds in the Fielding-Smollett school." The admirer of the sturdy eighteenth-century novel, even though he be fully alive to the limitations of its artistry, is, too, tempted to question whether the novel "has grown on the whole more truthful with each generation"—at least to the extent which Professor Burton suggests; to question, no less, whether "the characters of English fiction to-day produce a semblance of life which adds tenfold to its power." Judged even in the twentieth century, Fielding's creations, notwithstanding their exaggerations, seem to the present reviewer more fully vitalized than Mr. James's pale shades or Mr. Howells's, and a thousand times more real than the monstrosities of the "red-blood" tribe. Indeed, Professor Burton shares the common vagueness as to what is "realism"; he uses the word very frequently, even describing Dickens as a "stalwart realist," which certainly he never was.

This book shows evidences of hasty preparation for the press. On page 5 we read of "Nast" where Nash was surely intended; we have twice *mis-en-scene* (pp. 167, 232), and once *grande monde* (p. 163), as specimens of French as she is writ. Twice are titles of Daudet's novels mangled as regards genders and accents; and Flaubert wrote "Salammbô," not "Salambo." Obviously, there is something wrong with the expression, "Je suis, j'y reste"; and the use of "proletariat" as a noun referring to an individual (Charles Dickens—see p. 194) grieves us almost as much as these more obvious slips—of which enough.

New Zealand in Evolution, Industrial, Economic, and Political. By Guy H. Scholefield, with an Introduction by Hon. W. Pember Reeves, Director of the London School of Economics. New York. Imported by Charles Scribner's Sons. $3 net.

The story of New Zealand is not a long one. Discovered by the Dutch Tasman in 1642, it was not circumnavigated and mapped until nearly a century and a half later, when Cook took pos-

session of the islands for England. Though visited and to some extent settled upon by Europeans, it had no proper status and polity as a civilized land until two generations later, when, in 1840, it became formally a colony of Great Britain. Its evolution thence into a dominion, populous districts federated into a great United States, is a subject well worth attention from the world outside.

New Zealand has been called "the economic laboratory of the world." It is not quite as large as Italy, which it strongly resembles in its configuration; not quite equal in area to the British Isles, which it parallels remarkably in its physical and climatic conditions. The land has come to contain a population of a million, including a small per cent. of the vanishing Maoris, another small per cent. of civilized stocks other than Anglo-Saxon, but in vast preponderance a homogeneous body of English and Scotch. The British Isles themselves are less British than this far-away dependency. What the stock has been able to do during the seventy years since it was fairly organized into a society is the tale well-told in this book, fully fraught with interest and lessons.

The natural resources of New Zealand, varied and enormous, comprise great areas of arable and pasture-land, forests of the finest, seas teeming with food-fish, deposits of coal, iron, and gold, richly productive, as yet unmeasured. Here the British race has a free hand to develop under skies fitted to call out and preserve its energies at their best. The outcome is not disappointing, though New Zealand is far enough from being a Utopia. Studying details, we at once see that her career has been beset by grave embarrassments. First may be noted her remoteness and isolation: before competing in the great markets with her productions she has the heavy handicap of an ocean passage of thirteen thousand miles. It has been and still is necessary to fight out internally many a struggle with problems moral, economic, social, and political. There have been philanthropists who insisted that the native race should not be dispossessed; colonizers who projected feudal schemes, with a few great land-holders on one side and a multitude of tenants on the other; ecclesiastical enterprises, by which only the adherents of a particular church, under proper ortbodox tutelage, were to be admitted to vast domains. The home government has perplexed by unintelligent interference; and, again, perplexed quite as much by unintelligent abstaining from interference. What powers should belong to the provinces and what to the central government at Auckland; whether *laissez faire* should have full sway or the state foster in paternal fashion; whether women should vote; to what extent the state should own the land; most critical of all, perhaps, how to reconcile the demands of capital and those of labor, here fully organized and persistently militant—these questions have made of New Zealand a seething and fermenting society, shut up within itself in the far distant South Seas, to work out its own salvation.

Of this concentrated and turbulent evolution, Mr. Scholefield, an experienced New Zealand journalist, gives a calm, discriminating, and illuminative account. The land, though a loyal dependency of the British Crown, is to-day the most democratic and progressive country in the world. Female voting prevails, making the proportion of the electorate to the entire population one to one and eight-tenths. Here the suffragette may beat her hammer into a plough-share and her tongs into a pruning-hook; here the walking delegate walks no more, because he rides in an automobile; here the finger of the state is on land and industry to the extent of "socialism." Men of conservative instincts naturally stand aghast at such developments, and assert that New Zealand is going to the dogs; to which your true New Zealander may retort that he prefers the canine environment to the predatory beasts with whose rings civilization has so long been vexed. At any rate, all will agree it is well to have a laboratory or experiment-station where doubtful policies may be thoroughly worked out to their consummation, before they are applied in the larger societies of Europe and America.

Modern Religious Problems. Edited by Ambrose White Vernon. The Gospel of Jesus the Son of God, by George William Knox; The Founding of the Church, by Benjamin Wisner Bacon; Sin and Its Forgiveness, by William De Witt Hyde; The Fourth Gospel, by Ernest F. Scott; The Earliest Sources for the Life of Jesus, by F. Crawford Burkitt; Paul and Paulinism, by James Moffatt; The Church and Labor, by Charles Stelzle. Boston: Houghton Mifflin Co. 50 cents each.

This series of brief essays on vital and difficult religious questions is evidently patterned on the successful Religionsgeschichtliche Volksbücher, which have had great influence in Germany in spreading information concerning the newer theories and results in Biblical criticism and the science of comparative religion. The authors of the German booklets are the first scholars of the universities, broadly evangelical in temper, but pronouncedly progressive and modern in theological position. A large number of the German tracts have been of decided merit, not merely by gathering up the results familiar to savants, but also by advancing knowledge and clarifying opinions in difficult fields of research. They are consulted and quoted by specialists of all countries, despite their popular form and purpose.

It is high praise for the series edited by Dr. Vernon to say that the first volume of his Modern Religious Problems gives promise of like distinction and usefulness. Professor Bacon's brief essay on "The Founding of the Church" is a real contribution to the study of the apostolic age. It would be hard to find in a volume of any size a better statement of how the Christian Church came into being. It is a work which the student cannot afford to neglect, as well as a succinct statement for the laymen of the principal movements in early Christianity. President Hyde has done like thorough work in his discussion of the nature of sin and the Christian idea of divine pardon. His essay will go far to refute the charge, for which there is some justification, that the new theology does not deal seriously and wortbily with the evil that men do. That progressive theologians may also have a gospel, which rings out a message with fervor and intense conviction, is made clear in the brochure of Professor Knox. Mr. Scott's volume is not so noteworthy: it is a résumé of his larger and better treatise of the same title, "The Fourth Gospel."

Dr. Burkitt's discussion of the origin and historical reliability of the first three gospels is excellent, as was to be expected from the author of "The Gospel Story and Its Transmission." On some accounts it would have been fortunate if this volume had been chosen to lead the series, since it illustrates so well the critical methods which have led to the changes in opinion with which these volumes are concerned. Dr. Burkitt defends the priority of Mark, but questions Harnack's success in restoring "Q," the source employed by Matthew and Luke. Dr. Moffatt, in his essay on Paul, has some correctives for opinions popularized by Professor Ramsay. Mr. Stelzle's volume belongs to the third division of the series, Practical Church Problems.

A wide and enthusiastic welcome to these volumes, and to others which are announced to follow them, would be an encouraging sign of healthful and intelligent interest in religious questions on the part of the American public. In so far as they exert influence they will tend to establish faith which can live in the light of modern times.

Matilda of Tuscany. By Nora Duff. New York: E. P. Dutton & Co. $3.50 net.

Matilda, the warrior maid of Holy Church, the heroine of many a battlefield, the prototype of Tasso's Clarinda; Matilda, the ruler and judge, the gracious châtelaine of Canossa, learned and beautiful and wise and valiant, "the wonder of Italy"—such is the Matilda

whose story is told for us in these pages; while, to the end that no faintest speck may dim the lustre of her perfection, the stern and implacable Hildebrand, whose influence swayed her every action, is depicted as a saint of God, intent only on reforming and purifying the church. It is, however, equally possible to regard Matilda as a virago and a fanatic, the tool of an ambitious and unscrupulous prelate who recklessly plunged the church into an interminable strife; who, by grasping at temporal power, destroyed for centuries the spiritual usefulness of the Papacy, and, by condemning the priesthood to an enforced celibacy, permanently corrupted the vast majority of the clergy. Which of these views we accept will doubtless depend upon whether we are Guelfs or Ghibellines; and we are all of us Guelfs or Ghibellines when reading Italian history.

That Miss Duff is whole-heartedly Guelf goes without saying; but, however strongly we may dissent from some of her conclusions, we shall hardly ever find ourselves in a position to quarrel with her facts. These are, for the most part, quite beyond cavil; and, since English and American readers have heretofore known but little of the great Countess of Tuscany, the work before us is one of unusual value. In most mediæval histories Matilda has appeared only as a shadowy figure in the background of the striking drama enacted at Canossa; in the present volume all the most salient points in her life have been exhaustively dealt with—her stormy childhood, her upbringing in the Apennines, her early appearance, clad in armor, on the battlefields of Lombardy and before the gates of Rome, her unwavering support of the Papacy, her able generalship, and her qualities of sovereign lady and upright ruler. Of her relations with her humbler dependents, on the other hand, the "lombardi" and "cattani" of her *castella* and *ville*, or the serfs and "coloni" who tilled her vast domains, we hear little or nothing. The stage is filled with popes and emperors, cardinals and abbots, knights and nobles—all the great ones of the earth; and the incidents of that constitutional, intellectual, and social advance which are to be found in the history of the nation itself, have no place in these pages. Yet, within the limits which she has assigned to herself, Miss Duff has produced a notable piece of work, alike scholarly and readable. Not only has she studied all the more important books dealing with her subject, whether Italian, German, French, or English, but she has had access to such contemporary manuscripts as remain to us, including the Vatican codex of Matilda's monkish chronicler Donizone or Domnizo, and many deeds of gift to the various monasteries throughout her lands.

The volume is illustrated from contemporary portraits and documents, and, so far as we have tested it, the index seems adequate. It only remains to call the attention of Dante students to the arguments which are here adduced in support of the theory that Matilda is to be identified with that

> . . . donna soletta che si gia
> Cantando ed iscegliendo fior da fiore,
> Ond' era pinta tutta la sua via,

whom the poet encountered in the Terrestrial Paradise. We do not think that these arguments are conclusive. We are not convinced by them; but they are certainly interesting and well worthy of careful consideration.

Bologna: Its History, Antiquities, and Art. By Edith E. Coulson James. New York: Henry Frowde. $4 net.

Of the many books on Italian cities which have literally poured from the press in the past few years, this is one of the best we have seen. Miss James writes straightforwardly, with so thorough a grasp on her material that the level of achievement is unusually even. She does not pretend to be a specialist in any direction; but she has eyes to see what is significant and skill to state it both clearly and agreeably.

Her sketch of the history of Bologna, filling more than a quarter of the volume, is sufficiently detailed. The description of Bolognese buildings and paintings claims most of the remaining space, and not unduly, because it includes the university. That famous institution she treats on all sides, from its origin in the eleventh century down to to-day. We do not recall any account of it in English of similar length that is equally satisfactory. By introducing some of the great academic figures, among whom she places Novella Calderini, Laura Bassi, Anna Morandi, and Clotilde Tambroni—Bologna's famous women professors—she adds to the human interest of her information. Indeed, she has been wise in putting in personal material wherever it was pertinent: for a book of this kind, whose object is primarily information and not interpretation, runs the risk of being dry unless it be vitalized by anecdote and biographical touches.

Miss James proves an excellent guide for the Museo Civico, with its Etruscan treasures, and for the picture gallery. With sound judgment, which would have shocked our grandfathers, she concentrates her attention on Francia among the painters, and dismisses the Caracci, Guido Reni, and Domenichino with the brief mention which their work at Bologna merits. Her painstaking study of Francia, at once just and enthusiastic, ought to draw new admirers to that delightful master, who wears better than Perugino and other contemporaries that have often been preferred to him. A chapter on Bolognese "festas" completes the text to which notes and bibliography serve as credentials. A large number of well chosen illustrations bring Bologna directly before the reader.

Miss James has produced a work that is much more than a guide or book of reference. An Italian might, perhaps, remark that the characteristics which differentiate the Bolognese from the Parmesans, or the Florentines, are not clearly indicated; but this is a small matter, and few foreigners ever come to discern, as the Italians themselves do, the individual traits of the people of each city.

A Group of English Essayists. By C. T. Winchester. New York: The Macmillan Co. $1.50 net.

This volume of essays on Jeffrey, Hazlitt, Lamb, De Quincey, John Wilson, and Leigh Hunt is one of the few recent books of criticism which deserve a permanent place in the library. Professor Winchester's modest introduction scarcely prepares one for the excellence of the work that follows. He disclaims discovery of new facts or reversals of established verdicts; the interest of these papers, he says, "if any interest they have, is that attending the informal discussion of a group of familiar and delightful English prose-writers." Furthermore, in his essay on Hazlitt, he seems rather to decline the judicial and to favor the interpretative approach, declaring that the chief function of the critic is to enjoy the best in literature and to convey that enjoyment to the reader.

Professor Winchester's informality, however, is a bit of graceful feigning. He admires—what right-minded person does not?—the ease, the purity, the colloquial swiftness of Hazlitt's prose; so far as style is concerned, he aims at the informality of Hazlitt. But his judgments are no more exclusively favorable than are those of that sensitive and disheartened Jacobin; his condemnation has all the point and precision of his praise. Nor is there anything random or discursive in his method. He sets to work in quite systematic fashion to etch the lineaments of his subjects through biographical study, and then to show how their literary powers and limitations were conditioned by their characters. The contributiveness of his portraiture one feels not so much in the detail as in the total effect of fairness, proportion, and completeness. In dealing with these fascinating and intensely personal writers, the temptation of the critic is to be personal, also to take sides and becloud the reader's vision. Except in the incidental case of Gifford, whom he is bent on proving an ass, Professor Winchester's service is steadily directed to clarifying impressions and balancing the judgment. He has, furthermore, the

gift of becoming intimate with his author which results from flexible sympathies and a relish for diverse qualities of thought, emotion, and style. He brings out with the greatest zest the lusty and boyish energy of John Wilson. Like Hazlitt, he can be just to Jeffrey and yet adore Lamb. He follows with especial delight the movements of the meditative and soaring imagination; and yet he distinguishes swiftly enough between true and false elevation—between Hazlitt's impassioned solemnities of feeling and the puffed and windy sublimities of De Quincey. These studies, we are told, "are, for the most part, the result of many pleasant hours in a college seminary room." Students who have enjoyed this sort of contact with good literature in college seminary rooms are pitiably few and heartily to be congratulated.

The book is so good that one can, perhaps, forgive the two or three instances of Homeric nodding in the brief retrospective glance at the essay-form. On the first page, Professor Winchester says that Montaigne's "'Essais,' excellently translated by John Florio in 1583, were at once popular in England, and Bacon, fourteen years later, borrowed their title for his famous little bundles of apothegm." Montaigne's essays were not complete *in French* till Mademoiselle de Gournay's edition was published in 1595, three years after the author's death. Florio's translation was licensed in 1599, but not published till 1603, six years after Bacon's first edition of essays; and we believe it would be difficult to prove any considerable acquaintance with Montaigne in England before 1600. By some odd fatality, Professor Winchester also puts the date of Cotton's version of Montaigne at 1680, five years too early. A little later, succumbing to the temptation of stylistic point and neglecting all historical considerations, he remarks of Addison: "He had nothing of importance to say; but he could say it with a suavity, humor, and grace that make the veriest nothings admirable." It is hard to understand how any student of the social life of Queen Anne's time could have made such a statement. It is the essence of Addison's triumph that he had many things of high importance to say on taste, literature, and morals, and that he conveyed them to his readers in a form as palatable as if they had been the merest trifles. Finally, we are informed, in a sentence which suggests that these introductory pages were left to be written by a malicious undergraduate, that with the new Reviews and Magazines of the nineteenth century "for the first time, we have that extended discussion of some one theme, popular in manner yet accurate in statement, and admitting high literary polish to which we now confine the name of essay." It is to be hoped that such almost inexplicable fatuities will be removed from the second edition of this very entertaining book.

The Great French Revolution, 1789-1793. By P. A. Kropotkin. Translated from the French by N. F. Dryhurst. New York: G. P. Putnam's Sons. $2.25 net.

Until very recently most writers dealt only with the dramatic scenes of the French Revolution, or with the fortunes of the monarchy, of the legislative assemblies and political parties, and of the middle classes. Prince Kropotkin emphasizes the economic, and especially the agrarian, conditions and changes of the period. He interprets the wants and influence of the proletariat, whose apostle he is. He thinks historians have not yet done justice to "the true fount and origin of the Revolution—the people's readiness to take up arms." It is the land-hungry people who drove the stock-jobbing middle-class speculators and legislators to all that is great and good during the four years from 1789 to 1793. So there rumbles constantly through his stout volume the intimation that "Paris, during all this time, was in a state of profound agitation, especially in the faubourgs." In this Great Revolution the greatest period, in the opinion of the author, is that of the unchecked Jacobinism from the expulsion of the Girondists to the fall of Robespierre (31 May, 1793—27 July, 1794). During these thirteen months the great agrarian changes, so dramatically talked about on the famous night of August 4, 1789, were at last, after four years of middle-class resistance, carried out by a purified convention—under pressure from the *sans-culottic* masses. What the historians have chiefly studied of this period is the War and the Terror. "Yet these," says Kropotkin, "are not the essentials. The essential factor was the immense work of distributing the landed property, the work of democratizing and dechristianizing France." He emphasizes the principles of communism which found expression in the words or deeds of the period. Communism, he thinks, was the greatest inheritance which the Revolution bequeathed to us. He asserts a direct line of connection from the *enragés* of 1793 down through Babeuf, Fourier, Blanqui, and the International Working Men's Association of 1866-1878. The popular communism of the first two years of the Republic he regards as the source and origin of all subsequent communistic, anarchistic, and socialistic conceptions; and he is sure that it saw clearer and went much deeper in its analyses than modern Socialism. "Modern Socialism has added absolutely nothing to the ideas which were circulating among the French people between 1789 and 1794."

Prince Kropotkin's volume is another interesting example of the growing tendency toward socialistic interpretations of history. It is based on serious study, chiefly in the British Museum. The author has made no attempt to examine the rich store of manuscript material in the French archives. Naturally, he follows Jaurès's "Histoire Socialiste" at many points. But from an historical point of view much of Prince Kropotkin's volume is open to criticism. He is frequently guilty of an over-emphasis which amounts to a positive exaggeration. He cannot divest himself of his Russian revolutionary point of view, but injects, especially in the earlier part of his volume, many notions derived from his knowledge of the *mir* and recent conditions in Russia. When the Russian revolution became acute five years ago, newspaper correspondents crammed histories of the French Revolution into their portmanteaus as they started for St. Petersburg, and soon made half-baked analogies between France in 1789 and Russia in 1905. They were trying to interpret the present by the past. Prince Kropotkin has reversed the process. Nevertheless, in spite of these faults, we are inclined to think his work will find many readers. For it does describe in detail a phase of the French Revolution which historians have too much neglected, but which is of increasing interest to millions who call themselves Socialists.

The German Element in the United States: With special reference to its political, moral, social, and educational influence. By Albert Bernhardt Faust. In two volumes. Boston: Houghton Mifflin Co. $7.50 net.

In the early accounts of the Germans in America two important pioneer historians appear, Franz von Löher, with his "Geschichte und Zustände der Deutschen in Amerika" (1847), and Isaac Daniel Rupp, the historian of the Germans in Pennsylvania, with his county histories and "30,000 German Names." These two men furnished the material for a great mass of local and antiquarian works on the Germans in this country. Then followed another group of serious investigators, represented by Rattermann, Seidensticker, Koerner, and Kapp, with the periodical *Der Deutsche Pionier* as the organ of their researches. Under the stimulus of this effort, a number of associations, such as the Pennsylvania German Society and the Society for the History of the Germans in Maryland were organized, and began to publish local studies within their respective fields. Toward the end of the nineteenth century a new epoch opened of systematic, academic research, represented by M. D. Learned and his collaborators in the *Americana Germanica* and *German American Annals*. Among the important general treatments of the

Germans in this last period two are worthy of mention: "The German and Swiss Settlements of Colonial Pennsylvania," by Oscar Kuhns (1901), and "Das Deutschtum in den Vereinigten Staaten von Nord-Amerika," by Julius Goebel (1904).

Such were the conditions under which the works prepared in competition for the Catherine Seipp prize were written. The book of A. B. Faust, professor at Cornell University, won the first prize, and invites critical attention. Faust presents two volumes, quite different in character. The first contains a rapid survey of German colonization and settlement in America, and is based for the most part upon printed materials accessible in America. It gives a fair and accurate account of the successive epochs of German immigration to America and of the part taken by the Germans in the settlement of the United States. Beginning with Tyrker of Leif Ericson's expedition to Vineland in the eleventh century and the German cosmographers, Behaim, Mercator, and Waldseemüller, he traces in chronological order the history of the Huguenot settlement at Port Royal in South Carolina (1562), the English settlement at Jamestown, Virginia (1607), the Germans in New York and Pennsylvania before 1700, the exodus of the Palatines to New York, Pennsylvania, and other colonies (1709-10), the pre-Revolutionary settlements in Virginia, the Carolinas, and New England, and the extension of German colonization, after the Revolution, into Kentucky, Tennessee, the Ohio and Mississippi Valleys, and the great West—the story of a marvellous German migration, in comparison with which the great Germanic movements of the fifth century in Europe seem numerically insignificant.

The second volume treats of the influence of the Germans as factors in American civilization. Here the author appears as an investigator, and contributes new and valuable information concerning German enterprise in the New World. He discusses successively the German influence upon American agriculture, manufactures, politics, education, fine arts, literature, social and moral forms of life. The results of social research are particularly apparent in the chapters on the German blood in the American people, viniculture, architecture, and the graphic arts, for which the author has drawn not only from published sources, but also from first-hand unpublished information. The chapter dealing with the statistics of the German element in the United States commands general attention. According to the author's conservative estimate, the number of Americans with German blood is 18,400,000, or 27 per cent. of the entire white population.

In the summaries of German enterprise in America an attempt is made in each chapter to give the names of representative individuals and business firms that have introduced German ideas and methods into the various activities of American life. Naturally, many important names are omitted, but those given are intended to be typical, and are generally well chosen, although in some cases the author indulges in gratuitous personalities and praise of a kind that is always dangerous in dealing with the living.

The chapter on the social life of the Germans in America is timely, inasmuch as Americans are only beginning to understand the significance of European customs in the rapid evolution of new forms of American life—a process which is destined to revolutionize Puritan ideals, in spite of the heated temper of the opposing factions, both in the domain of religious and social forms.

It is not surprising that a work of such magnitude should contain minor mistakes, such as misprinted dates, which the informed reader will easily correct for himself. The Dunkers may reasonably object to being called "Dunkards," as this latter form is now going out of use. The German Catholics of Goshenhoppen might object to being transferred from Berks County to Montgomery County, Pa. Some Pennsylvania antiquarians reject the story of Moll Pitcher as mythical. The German origin of Abraham Lincoln has recently been proved to be unfounded. The Moravians will probably prefer their official title "Unitas Fratrum," or even the name "Herrnhuter," to the misleading name "United Brethren," which is so easily confused in the popular mind with the "United Brethren in Christ."

Casper Wistar was not the first glass-blower in America, as Pastorius reports one at Philadelphia (Frankfort) in 1684. Abram Cassell did not will his entire collection to the Historical Society of Pennsylvania. Part of it went to Juniata College, and another part to Dr. M. G. Brumbaugh. Helmuth was not the first professor of languages at the University of Pennsylvania.

The author writes from the pro-German point of view and presents a favorable picture of the German influence in the growth of American institutions, without always carefully analyzing the complex ethnic processes involved. It is a delicate and difficult task to determine the exact value of the manifold and often invisible ethnic forces in the evolution of a new civilization, and it is easy to mistake the phenomena resulting apparently from a single impact, or as superficially recorded in political history.

Notwithstanding the eighty pages of bibliography with which the second volume closes, the study of American ethnic relations is in its infancy, and has only begun to attract the attention of trained investigators. To this study, the allied sciences, philology, literature, sociology, psychology, and geography, in a word, ethnology in its broadest sense, must contribute. The local annals of many German settlements still lie under the dust of unordered archives and land offices. In addition to these, the vast collections of records in European archives still remain, for the most part, unexploited. A constructive history of the Germans in America will only be possible after the most thorough research into the special activities of the Germans in America has been made.

Thus viewed Faust's work becomes a record of what has been accomplished, an invaluable work of reference for the future investigator and student, and clears the way for fresh research, not only in the field of German effort in the United States, but in American ethnic relations in general.

Notes.

Browning's "Men and Women," a verbatim reprint of the original edition, and Shelley's Prose, in the Bodleian Manuscripts, are about to be added to the Oxford Library of Prose and Poetry.

Forbes & Co. announce the following books for publication this spring: "The Girl Wanted," by Nixon Waterman; "Engaged Girl Sketches" and "The Six Great Moments in a Woman's Life," by Emily Calvin Blake; "Including Finnigin," by Strickland W. Gillilan; "The Saints and Sinners Calendar for 1911."

The State University of Iowa announces the intended publication of an elaborate annotated edition of Strabo's Geography. The plan contemplates an introduction on the life, travels, and sources of Strabo, a translation of the Geography, and extended notes, much after the manner of Frazer's Pausanias. It is hoped that such an edition will prove acceptable to scholars in various fields, since no satisfactory edition of Strabo exists, and he is our most important authority for the geography and topography of much of the ancient world. The work of the edition will be carried forward as rapidly as is consistent with thoroughness. The plan of the edition is due to Dr. Charles H. Weller, Dr. David M. Robinson, and Dr. Albert T. Olmstead. Dr. Weller is general editor, Dr. Robinson will make the translation. The various portions of the work are assigned to specialists.

"The Modern Criminal Science Series," selected from the works of European criminologists, by Prof. John H. Wigmore, president of the American Institute of Criminal Law and Criminology, is announced by Little, Brown & Co. The series will include the following volumes: "Criminal Psychology," by Hans Gross, professor of criminal law in the University of Graz, Austria; "Modern Theories of Criminology," by Bernal de Quiros of Madrid; "Criminal Sociology," by Enrico Ferri, professor of criminal law and procedure in the University of Rome; "The Individualization of Punishment," by Raymond Saleilles, professor of

comparative law in the University of Paris; "Crime, Its Causes and Remedies," by Cesare Lombroso, late professor of psychiatry and legal medicine in the University of Turin; "Penal Philosophy," by Gabriel Tarde, late magistrate in Paris and professor in the College of France; "Criminality and Economic Conditions," by W. A. Bonger, doctor in law of the University of Amsterdam; "Criminology," by Raffaelle Garofalo," late president of the Court of Appeals of Naples; "Crime and Its Repression," by Gustav Aschaffenburg, editor of the *Monthly Journal of Criminal Law and Criminal Law Reform.*

The Sturgis & Walton Co. announce the following spring publications: "The History of the Confederate War; Its Causes and Its Conduct. A narrative and Critical History," by George Cary Egleston; "Ragna," by Anna Costantini; "The Fulfillment," by Alice P. Raphael; "The Green Cloak," by Yerke Davis; "Inns, Ales, and Drinking Customs of Old England," by F. W. Hackwood. "Jacqueline of the Carrier Pigeons, a story of the Siege of Leyden," by Augusta Huiell Seaman; "An Out-of-Door Diary for Boys and Girls, a Nature Note-Book for Young People," illustrated and arranged by Marion Miller; "The Garden Muse: Poems for Garden Lovers," gathered by William Aspenwall Bradley; "Reptiles of the World," by Raymond L. Ditmars; "Comets," by Henry W. Elson; "Star-Gazer's Hand-Book, a Brief Guide for Amateur Students of Astronomy," by Henry W. Elson; "The Lost Art of Conversation, Selected Essays," edited with an introduction by Horatio S. Krans; "Stories of Authors," by Edwin Watts Chubb; "The Young Farmer's Practical Library," Ernest Ingersoll, general editor, including "Home Waterworks," by Prof. Carleton J. Lynde; "From Kitchen to Garret," by Virginia Terhune Van de Water; "The Satisfactions of Country Life," by Dr. James W. Robertson; "Neighborhood Entertainments," by Renée B. Stern; "Roads, Paths and Bridges," by L. W. Page; "The Farm Mechanic," by Prof. L. W. Chase; "Health on the Farm," by Dr. L. F. Harris; "Farm Machinery," by Prof. J. B. Davidson, and "Electricity on the Farm";—"Children's Gardens for Pleasure, Health, and Education," by Henry G. Parsons; "The Teachers of Emerson," by John S. Harrison; "An Outline of Individual-Study," by G. E. Partridge; "Each for All and All for Each," by John Parsons; "Roman Cities of Northern Italy and Dalmatia," by A. L. Frothingham; "The Court Series of French Memoirs," translated from the French and edited by E. Jules Méras including, "The Royal Family in the Temple Prison," by Cléry (Jean Baptiste Cant-Hanet); "Recollections of Léonard, Hairdresser to Marie Antoinette," by Léonard; "During the Reign of Terror: The Journal of Grace Dalrymple Elliott": "Secret Memoirs of the Regency (The Minority of Louis XV)," by Charles Pinot Duclos;—"West Point and the United States Military Academy, a Brief History," by Edward S. Holden.

Spring publications of the Cassells include the following: Fiction—"The Rust of Rome," by Warwick Deeping; "A House of Lies," by Sidney Warwick; "The Shoulder Knot," by Mrs. Henry Dudeney; "Who Shall Judge?" by Silas K. Hocking; "Blind Hopes," by Helen Wallace; "The Wreathed Dagger," by Margaret Young; "A Daughter of the Storm," by Capt. Frank H. Shaw; "The Secret Paper," by Walter Wood; "London and a Girl," by Alfred Gibson; "Beyond this Ignorant Present," by S. L. T. D. General literature—"Napoleon in His Own Defence," by Clement K. Shorter; "Puritanism and Art," by Joseph Crouch; "Steamships and Their Story," by E. Keble Chatterton; "Electrical Distributing Networks and Transmission Lines," by Prof. Alfred Hay; "Australia: The Making of a Nation," by John Foster Fraser; "The Faith of a Layman," by William Frederick Osborne; "The Dictionary of English History," edited by Sidney J. Low and F. S. Pulling, M.A., new and revised edition; "A Lad of London, and Some of His Neighbors," by George Haw; "Janey Canuck in the West," by Emily Ferguson; "Cassell's Royal Academy Pictures and Sculpture"; "Home Life of the Ancient Greeks," translated from the German of Blumner by Alice Zimmern; "A Bible Commentary for English Readers," edited by Bishop Ellicott; "Farm Equipment," by Primrose McConnell; "The Ideal Garden," by H. H. Thomas; "Dogs and all About Them," by Robert Leighton; "Gardening Difficulties Solved." by H. H. Thomas; "The Thames and Its Story, from the Cotswolds to the Nore"; "Cassell's Dictionary of Gardening," edited by Walter P. Wright; "Cassell's Little Classics," introductions by G. K. Chesterton, Austin Dobson, A. T. Quiller-Couch, and J. A. Hobson; "How to Know the Trees," by Henry Irving; "Golf Made Easy," by Mark Allerton and R. Browning; "Plain Needlework and Cutting-Out," by Mrs. F. B. Townend; "The Complete Farmer," by Primrose McConnell; "Japan: The Eastern Wonderland," by D. C. Angus; "Cassell's Guide to London," new edition; "The Art and Curio Collector's Guide to London," edited by C. W. E. Jerningham; "My Little German Travelling Companion," by Ludwig Kettner; "A First Sketch of English Literature: From the Earliest Period to the Present Time," by Prof. Henry Morley; "Makers of History," by A. E. McKilliam; "Modelling from Nature," by Lillian Carter; "A History of England," by H. O. Arnold Forster; "The Case Against Christian Science," by Stephen Paget; "First at the Pole, a Story of Arctic Adventure," by Capt. Frank H. Shaw.

We welcome heartily a new edition, after a period of some ten years, of Myra Reynolds's "Treatment of Nature in English Poetry Between Pope and Wordsworth," published at the University of Chicago Press. The original portion of the book has undergone, and indeed needed, little revision. The work has been enlarged, however, by the addition of two new chapters on Painting and Gardening. As a book of reference the work is higbly valuable; little of significance in eighteenth-century England, in literature at least, has escaped the author's dragnet, and she has arranged and classified her material so as to show very clearly the gradual change from the classical (she should have called it pseudo- or neo-classical) school of Pope to the romantic school of Wordsworth. That she is herself unreservedly romantic in her taste, does no particular harm in a book which is more likely to be consulted for its material than its critical philosophy. And she is certainly right in so far as the pseudo-classical writers were weakest just where the romanticists were strongest.

The "Papers and Proceedings" of the 1909 conference of the American Library Association, just issued, make a stout volume of 461 pages, full of interesting matter—interesting not merely for librarians, but for all who take an intelligent interest in the educational movements of the day. Librarians are wont to regard themselves as workers in the educational field quite as much as distributors of books for recreational purposes and conservators of material for the scholar and investigator. Under the circumstances it is somewhat strange that the proceedings of the national association of librarians are not for sale, but merely distributed to members of the association. Librarians wish to spread their idea of the mission of the book, and their influence as missionaries of the book, among all classes of our people, and complain even of the fact that they are not recognized as a profession to the same extent as, for instance, the teachers. Perhaps one reason for this is that their official proceedings are not available for outsiders. This is particularly to be regretted, as much the most thoughtful contributions to our library literature and the most authoritative statements from the leaders in the profession of librariansbip, are to be found in these proceedings. Librarians, when they write in their professional journals, are wont to treat too exclusively of matters of technical detail, or to write down to younger colleagues and beginners, or to treat their subjects in a somewhat namby-pamby fashion. Very few of them contribute articles on library matters of general interest to the periodical press at large, and the number of books on library affairs and management is exceedingly small, compared with the literary output of the teaching profession. The reason is not far to seek; librarians are as a rule much more confined to their offices and much more engrossed in all sorts of detail matters than teachers; consequently, what time they are able to give to writing must in the great majority of cases, be taken from their scant hours of rest and recreation. Both the libraries, and the public, are losers.

It would be well, therefore, if the proceedings of the librarians at Bretton Woods could be put in the hands of and read by a much larger number of persons who are interested in educational affairs than is possible now. While containing much technical matter, the volume has several papers of more general interest. The topic at one of the general sessions was, "The School and the Library"; another session was given to a symposium on recent books about boys. And through all the discussions we see the idea of coördination of forces. The president, Mr. Gould of McGill University, in Montreal, laid before the assembled librarians a plan for a library system that would cover the whole continent. From California, and from Washington County, in Maryland, came reports of efforts to spread the benefits of coöperation over a smaller area. Mr. Hill of Brooklyn, and Mr. Hodges of Cincinnati, the new president, told what they are doing in their respective communities to attack the problem of dead books. The address of Dr. Crothers, "A Fairy Story for Librarians," whose genial wit and pleasant banter delighted all, is not printed in the proceedings volume, but is found in the *Atlantic Monthly*

for December, under the title, "The Convention of Books."

The latest (eighth) volume of the Jahrbuch deutscher Bibliotheken begins the extension of the scope of the list of libraries, as was forecast in the previous volume, by inclusion of a number of libraries belonging to learned societies, government bodies, and the like. The additions in the present volume come chiefly from Berlin and Munich; they include the important library of the Seminar for Oriental Languages in Berlin, as well as those of most of the Imperial ministries and other organs of the Federal government, while the additions from Munich are largely the libraries of religious corporations. The most important of the new statutes and regulations is the law about the examination for diplomas to enter the intermediary service at the scientific libraries and the public library service. In Germany there is a wide gap between the scientific libraries intended to further learned studies and those more recently founded *Volksbibliotheken* which serve the masses of the population for educational and recreative purposes. For entrance into the service of university libraries and others of that grade a university degree is almost necessary, whereas, for the lower grade of work contemplated in the new degree, the requirements for admission to the highest grade of the gymnasium or *Realgymnasium* is thought sufficient. In addition to this, the candidates for diplomas are required to pass an examination in library administration, bibliography, and literary history that seems to be considerably stiffer than the examination required for degree in any of our library schools. Particularly the requirements in the history of science and literature are raised to a high standard (Leipzig: Harrassowitz).

"Charles Dickens and his Friends," by W. Teignmouth Shore (Cassell & Co.), is a well-made book belonging to that large class which Solomon mentions with mild despair. It is adorned with eighteen familiar illustrations. Its substance is drawn from the inexhaustible mine of Dickensiana, eked out with the froth from the biographies of a dozen contemporaries. Its structural character may be inferred from the titles of the chapters; here are a few specimens: 1843, Oddments and Eloquence, Wilkie Collins, More Playing, Other Friends, The Wearing of a Beard. We are tempted to cry in the words of the immortal doctor, "Sir, a man might write such stuff forever, if he would *abandon* his mind to it." It is the ultimate dilution and disintegration of biography. Yet we would not speak of it with undue severity; as Uncle Toby remarked to the fly, "This world surely is wide enough to hold both thee and me." It will make an immediate appeal to every lover of undistinguished chatter.

The nature of "The Strength of England," by J. W. Welsford (Longmans), is partly explained by its sub-title, "A Politico-economic History of England from Saxon Times to the Reign of Charles the First." Death prevented the author from continuing it to the present day. Mr. Welsford was primarily interested in England's commerce; for in this, he thought, lay, and lies, her strength. He was at pains to give a much fuller account of England's international position than is ordinarily found in shorter histories. He believed that political and economic changes are constantly reacting upon each other. Therefore, he sought to show how England's commercial relations have affected the development of various classes of society, and even brought about or thwarted great constitutional changes. He asserts, for instance, that "the failure of Simon de Montfort's scheme of constitutional monarchy was due, not to his legal reforms, but to a vast economic change which he tried to carry out while he was engaged in political reforms." Mr. Welsford's book is stimulating reading. It sets many episodes of English history in a fresh, strong light. On the other hand, owing to the author's point of view, it is altogether one-sided; even as an economic interpretation of English history it is one-sided, because of its overemphasis of commerce and its comparative neglect of industry and agriculture.

The new volume (No. VI), of Publications of the Bostonian Society contains much that is of more than local interest. The story of the life of John Wilson, the first pastor of Boston, told by Frank E. Bradish, shows what sacrifices were made by some of the early settlers of this country. Born in Windsor Castle, grandnephew of the archbishop of Canterbury, an Eton boy and graduate of King's College, Cambridge, he might have aspired to almost any dignity in the Church of England. Though his domestic and scholastic training prejudiced him strongly against the Puritans, study and inquiry led him to accept their views, and he spent fifteen years as an itinerating preacher in the small towns of southern England. Then for thirty-seven years he labored in Boston, one of its very first settlers, for the upbuilding of the land of his adoption. The first year his soul-stirring sermons were preached under a tree in the open air; and there is little doubt that he had much to do with the founding of Harvard College.

From the University of Chicago Press we have a study of the "Atonement" which bears the names of three authors, E. D. Burton, J. M. P. Smith, and G. B. Smith. The scope of the book is indicated by the sub-title: "Biblical Ideas of Atonement, Their History and Significance." The authors propose to give not a theory of the significance of the death of Christ but an historical account of the various ideas of atonement to be found in the Old Testament (treated by Dr. J. M. P. Smith), in some of the non-canonical Jewish documents within the period of Late Judaism, and in the New Testament (treated by Dr. Burton). The results of literary criticism are assumed; only occasionally does a footnote refer to an alternative view. All but the last two chapters have already appeared in the *Biblical World* substantially in the present form. In the new chapters Dr. G. B. Smith endeavors, in the brief space assigned him, to estimate the value of the Biblical teachings and to relate them to the ethical spirit of the present. The volume is to be commended to the general reader for whom it is especially designed.

"At the Library Table," by Adrian Hoffman Joline (Richard G. Badger), reveals once more the rambling bookishness of this whimsical author. Four of the essays are concerning bookish things in general; two, on the novelists William Harrison Ainsworth and G. P. R. James, keep reasonably to a theme. But here Mr. Joline is not renouncing his usual zig-zag method. The chance of owning interesting autographs by these writers makes him for the nonce systematic. We like him best when he sits in his library and reacts to the random impressions evoked from the smell of old morocco and calf. His art is not very fine, but it is genuine and personal. The full flavor of the great ramblers is not in him, but he is sealed of the tribe. His work recalls how scantily the real essay—that syllabub of whim and gusto—has been cultivated in America. Irving, of course, and Dennie of the old Philadelphia *Portfolio* were born to it. Lowell and Curtis dallied with it here and there, when graver concerns permitted. Howells could do it were his humanitarian concern abated. But literary rambling is an art in itself and hardly to be followed successfully by one who heedlessly permits his writings to be systematic between times. Here Mr. Joline and the late author of "Salad for the Solitary and the Social" enjoy a modest distinction. Neither is much read, but since each has cultivated his garden in an exceptional spirit the classifiers of the future must reckon with them. For present purposes Mr. Joline is a pleasant companion. In the pages of some remote dissertator on the American essay he may even attain a pale immortality. We find him trying only in his rare lapses into the earnest vein, as in his comment on Sumner. Irrespective of the merits of the case, the taste and the air of finality of the observations are out of tone. From his collections Mr. Joline brings to light some new and entertaining matter anent the squabble of Dickens, Ainsworth, and Cruikshank, and the friendships of that good and amiable man G. P. R. James. Incidentally, the vain and repetitious ways of encyclopædists. and semi-critics generally are amusingly exposed. The book is fastidiously made.

Eleven years ago, in reviewing "The Martyrdom of an Empress," in these columns, we pointed out the improbability of its having been written by any one having even an elementary knowledge of Austrian affairs, much less, as it purported to have been, by a lady of the court of the Empress Elizabeth. A few years later the same author unblushingly turned from a fierce accuser of Francis-Joseph as a monster of cruelty into his fervent panegyrist, in her "Keystone of Empire." We have now, if not from the same hand, at least from the same dull scissors and soiled paste-pot, "The Real Francis-Joseph" (Appleton), for which "Henri de Weindel" stands as sponsor, and the facts for which are stated in the preface to have been communicated to the author by "a person in Austria particularly well informed about the court of Vienna." Even the same blunders may be found in this book as in the "Martyrdom of an Empress." Thus, the Archduke Albert, cousin of Francis-Joseph, appears once more as his uncle; but the later book swarms with even more striking evidences of its spurious authorship. No one who had ever set foot on Austrian soil, or even read a decent book about Austrian affairs, could have written that "one of the reasons (but one of the reasons only) of the hostility of the Hungar-

lans toward the person of their Sovereign lies in his ignorance of their language"; nor could any one who had ever heard of the characteristics of Vienna, much less been there, have said of the cheap one-horse cabs of that city known as "comfortables" that they are "very expensive to hire." A hundred similar proofs of the author's absolute ignorance of his subject might be adduced, but they are trifles as compared with the tone, purpose, and literary skill of the book. Like its predecessors in this delectable series of scandalous "revelations," it appeals to the dullest intellect, and is worse than worthless.

Robert Wilson Patterson, president of the Chicago Tribune Company, and editor-in-chief of that paper, died in Philadelphia last week, at the age of sixty. He graduated at Williams College in 1871, began newspaper work in that city soon afterward, and in 1873 became connected with the *Tribune*, of which he was made editor-in-chief upon the death of Joseph Medill.

The Rev. Dr. Charles Orrin Day, who was president of Andover Theological Seminary and Bartlett professor of homiletics and practical theology there from 1901 to 1908, died in Andover, Mass., last Tuesday, at the age of fifty-eight. He was a native of Catskill, N. Y., and graduated at Yale in 1872 and at Andover in 1877, in which year he entered the Congregational ministry. He held a pastorate at Brattleboro, Vt., in 1885-98, and was secretary of the Congregational Educational Society in 1898-1901.

Mrs. Allan Macnaughton, widely known under her maiden name, Myra Kelly, as a writer of stories of child life in New York's East Side, died at Torquay, England, on March 30. She was a native of Dublin, Ireland, and came to this country in her childhood with her father, Dr. James E. Kelly, who established a practice in the East Side. She was educated at the Horace Mann School, in this city, and at Teachers' College, of Columbia University, where she graduated in 1899, and began to teach at Public School 147, on East Broadway. Here she got the material from which she wrote the sketches that brought her fame and fortune. In 1905 she was married to Allan Macnaughton. Her books include "Little Citizens," "Isle of Dreams," and "Wards of Liberty."

Dr. George McC. Theal, foreign member of the Royal Academy of Sciences, has recently completed the second volume of his three-volume series on the "History and Ethnography of Africa, south of the Zambezi," from the settlement of the Portuguese at Sofala, in September, 1505, to the conquest of the Cape Colony by the British in September, 1795. The volume in question is entitled, "The Foundation of the Cape Colony by the Dutch" (London: Swan Sonnenschein & Co.). It is an exceedingly thorough and detailed record of early Dutch effort in Africa, containing 523 pages, invaluable to the historical investigator and also not uninteresting to the general reader.

Félix Tournachon, the French caricaturist photographer and aeronaut, died in Paris recently, at the age of ninety. For more than fifty years he had been known by the pseudonym, "Nadar," under which he published "Panthéon Nadar," containing picturesque studies of his "most famous contemporaries," and contributed frequently to the *Revue Comique*, which he founded in 1849. He was also much interested in aviation, and about fifty years ago constructed the "Géant," the largest balloon which had then been made, and in which he made a hazardous journey from Paris to Hanover. He had also lectured and published books on heavier-than-air flying machines, of which he invented and manufactured a type which he named "aeromotive," an enterprise which ruined him financially; and he made the first military balloons used during the siege of Paris. He is said to have been the original of Jules Verne's hero, Michel Ardent. In the late forties he published in his paper, *Le Commerce*, a translation of Edgar Allan Poe's story, "The Murders of the Rue Morgue," which seems to have been the first introduction of Poe to French readers.

Science.

Two recent books from the pens of well known authorities, "The Great White Plague," by Edward O. Otis (Crowell & Co.) and "Tuberculosis, a Preventable and Curable Disease," by S. Adolphus Knopf (Moffatt, Yard & Co.), deserve a brief commendation in this column. They are popular treatises of unusual excellence and clearness, and of reasonable length; well worthy of a wide and attentive circle of readers. Dr. Otis tries to present the more important facts concerning the disease, to explain the principles of treatment and the value of coöperation, and to make clear to the layman that any case of tubercular trouble, if taken in hand early, has an exceedingly good chance of recovery. All this is done in simple language, here and there a little too diffusely, but on the whole so as to give even a very ordinary reader sound ideas as to what the individual and the community may do to eradicate tuberculosis. This book is in parts supplemented by that of Dr. Knopf, who concerns himself less with the disease than with the more practical questions of the care of patients at home or in establishments, and with the arrangement of the house or the sanatorium for this purpose, seeking to awaken also popular interest in the means at our disposal for combating the disease. This is illustrated by a large number of exceedingly good pictures to show the methods of the fresh air treatment at home, in schools, and in numerous public and private institutions. Dr. Knopf explains at some length his ingenious window-tent. The window-tent of the late Dr. Charles Denison is in many ways perhaps a more advantageous arrangement; it was at least worthy of mention.

"Parenthood and Race Culture, an Outline of Eugenics," by C. W. Saleeby (Moffatt, Yard & Co.), professes to be an authoritative general introduction to the subject. The most casual reader of the preface will perceive that the eugenist, a name for which Dr. Saleeby is proudly responsible, takes himself and his cult very seriously, apparently believing that the human race has hitherto paid little heed to its own advancement. Eugenics is declared to be "a science and a religion," whose central doctrine is not a new birth, but a better birth, the very best kind of a birth; and to this attach themselves all sorts of considerations, prenatal and postnatal, which can possibly affect the child—a most comprehensive programme. The book is made up of nearly equal parts treating what are called the theory and the practice of eugenics. The first of these, entering various fields of discussion and culling freely the fruits of many laborers, is largely justificatory of the proposition that there shall be no destruction of the unfit, but a preservation of all children, since a well-developed eugenistic spirit will prevent or limit the creation of the unfit. There is much interesting matter here, although rather too long drawn out in the presentation. The problem of heredity is put as though prevailing doctrines had a finality which the community is bound to accept as an absolute guide for its own breeding. At least this is the impression, which many readers will get, despite a considerable amount of qualification. The second part does not quite fulfil the promise of its title. It gives an account, often repetitious, of the conditions which may make persons undesirable candidates for parenthood rather than any definite directions as to the control of parentage, except perhaps in the general belief that the matrimonial state is to be preserved, with the corollary that the conversion of Mrs. Grundy "to the eugenic idea" is to be sought rather than her abolition. In one appendix is a short account of the recently founded Eugenics Education Society. In another Dr. Saleeby briefly commends a goodly number of books which he regards as important for the progressive and earnest eugenist.

Those whose acquaintance with William Thomson (Lord Kelvin) is confined to a knowledge of his scientific work will be delighted with the book from the Macmillan Co., entitled "Lord Kelvin's Early Home." It is principally taken from the notes and diary of his eldest sister, Mrs. Elizabeth King, edited by her daughter. We have a picture of a beautiful family life, and of a fascinating group of children, watched over and taught after the mother's death by their father, James Thomson. The father led a busy and important life, first as a teacher of mathematics in Belfast and later as a professor in the University of Glasgow. Besides his professional duties, he found the time to give his six children practically all their educational training. How successful he was may be judged by their achievements. We get a charming impression of the future Lord Kelvin, who was evidently his father's favorite: "Partly," Mrs. King says, "perhaps on account of his extreme beauty, partly on account of his wonderful quickness of apprehension, but most of all, I think, on account of his coaxing, fascinating ways, and the caresses he lavished on his 'darling papa.'" When the family removed to Glasgow, private instruction and reading continued; but, with the growth of the children, outside influences began to enter, and soon William and his elder brother James were attending classes in the college and making a start in the scientific work which was to engross their lives. At the age of sixteen William published his first paper in connection with his reading of Fourier's "Théorie de la chaleur," a book which made a profound impression on his mind; the next year he began his brilliant career at Cambridge. The account of his home life ends with his election to the profes-

sorship of natural philosophy in Glasgow, the chair which he made so famous during the fifty years of his occupation.

The principles of dry-farming, the paradox of modern agriculture, are again treated in William Macdonald's book on the subject ("Dry-Farming, Its Principles and Practice," the Century Co.). By conserving the soil-moisture through deep and thorough tillage, lands with a rainfall of less, often much less, than thirty inches can be made to yield grain crops more cheaply than irrigated land. The book emphasizes the need of care in choosing a dry-farm. Soil, sub-soil, and water-table, with average rainfall and rate of evaporation, should be accurately ascertained beforehand, since any one of them can be a cause of failure to "a business man calling himself a farmer." Methods vary according to locality, but there seems to be a growing agreement that the usual alternate-year summer fallow should be accompanied by constant culture to kill weeds and conserve moisture. By these means three great Western areas, containing lands that can never be adequately irrigated, are being reclaimed from barrenness. The pictures in the book are interesting; the book itself could have been made so, but it is badly planned.

Dr. Otto Hermes, founder of the Berlin Aquarium, died in Berlin recently, at the age of seventy-one.

Samuel Ward Loper, curator of the museum of Wesleyan University, died at Middletown, Conn., last week, at the age of seventy-four.

Dr. J. P. C. Foster, head of the Connecticut State Tuberculosis Commission, died in New Haven last week at the age of about sixty-five. He was one of the first American physicians to use Dr. Koch's tuberculin in treating tuberculosis.

George Leonard Vose, professor of civil engineering at Bowdoin from 1872 to 1882, and at the Massachusetts Institute of Technology for four years thereafter, died at Brunswick, Me., last week. He was born in 1831, and was educated at the Lawrence Scientific School. In 1860-64 he was an associate editor of the *American Railway Times*.

Drama.

Since last we noticed the excellent First Folio Shakespeare of Thomas Y. Crowell & Co., two instalments have brought the edition six volumes nearer completion. The new plays now available are "Anthonie and Cleopatra," "Titus Andronicus," "Tymon of Athens," "Pericles, Prince of Tyre," "Tragedie of Cymbeline," and "Troylus and Cressid." The editing shows the same care and thoroughness as in the earlier volumes, and we can only repeat what we have already said several times, that, for those who do not object to reading Shakespeare in the original spelling and punctuation, this is in general the most convenient edition on the market. The arrangement is admirable, and the helps to understanding and studying are full without being obtrusive. The introductions, which form the least important part of the edition, are perhaps open to criticism. The editors, Charlotte Porter and Helen A. Clarke, are of the old-fashioned sort who stand for their author through thick and thin. One catches scarcely an echo in their writing of that rapidly growing revolt from the romantic enthusiasm of an earlier generation. They are ready to vindicate to Shakespeare every possible play or portion of collaborated play, and all that he wrote is supremely good. Miss Porter's introduction to "Pericles" is a case in point. She will have nothing of Wilkins as maker of this play, which to her has a "final adorable distinctive grace" in the issue of the plot.

The revised edition of William Vaughn Moody's play, "The Faith Healer," has been published (Macmillan). This is the version which was produced recently in this city, with but indifferent success, after the play as originally written by the author had failed to please Western audiences. The changes made—it is understood at managerial suggestion—solely with a view to increased theatrical effect, are not improvements in any way so far as stage representation is concerned, while they give to the piece a melodramatic and artificial quality which it did not possess before. It is seldom that tinkering of this sort proves beneficial. The great weakness of the play, in its first estate, as has been pointed out in this journal more than once, was the vagueness of its intent and meaning, as if the author were himself in doubt concerning the true nature of the phenomena with which he had undertaken to deal. This defect is as conspicuous in the revised version as in the old, while the development of the story is less artistic. It is doubtful whether the work in either form—notwithstanding its dramatic and imaginative force—could win a great popular success in the theatre, but its cool reception in New York—whatever may have been the case in the West—was due mainly to the uninspired and unsympathetic performance of the leading actor.

The "Pocket Lexicon and Concordance to the Temple Shakespeare" (Macmillan) furnishes a large amount of useful information in compact and handy shape. Its definitions are clear and seldom superfluous, while the exact meaning of obsolete words and phrases is often happily elucidated by reproduction of ancient prints. The use of older glossaries is copious and, as a rule, judicious, and the list of authorities quoted includes the names of the most respected commentators.

"The Tocsin," a drama of the Renaissance, by Esther Brown Tiffany (Paul Elder & Co.), though scarcely worthy, from either the literary or dramatic point of view, of the luxurious typographical form in which it is published, is by no means a bad specimen of religio-romantic melodrama. The scene is laid in and near Florence, in the days of Pope Sixtus V, when the plague was raging, and the atmosphere of the period, with its contrasted episodes of dissolute wealth, squalid misery, clerical laxity and profligacy and fanatical religious zeal, is cleverly reproduced. The principal figures are a brilliant and worldly Abbot, once the most fervid preacher of his day, and a saintly Magdalen, who, in her early youth, was converted from the error of her ways by his inspiring eloquence. Her chief desire is to meet once more with the evangelist who has long been her ideal. She finally discovers him as a renegade voluptuary enjoying himself, with his attendant monks, in the pure mountain air, while his deserted flock perish miserably of the pestilence in the city below. In a really striking situation she hails him as her spiritual father, rehearsing the method of her own conversion, and so works upon his conscience that presently he sounds the tocsin and summons his monks to return with him to labor among the dead and the dying. Secular interest in the story is maintained by the adventurous history of two lovers, whose happiness is finally brought about by the apparently miraculous intervention of the saintly Maddalena. The dominant note of the play is one of religious rhapsody, and in other respects, the piece, in its present shape, is scarcely fitted for stage representation; but its quality is dramatic, and it shows both descriptive and imaginative power. The sincerity of its purpose is unmistakable.

Music.

Unmusical New York. By Hermann Klein. New York: John Lane Co. $1.50 net.

It is surprising that Schopenhauer did not mention among the many arguments favoring his system of pessimism the fact that when a man deliberately starts out to tell "the truth" about anything, he invariably has something disagreeable to say. Last October Hermann Klein delivered a lecture in London under the title of "The Truth about Music in America." He had, after devoting a quarter of a century to teaching in London and writing musical criticisms, emigrated to New York, where he taught a few years, and, toward the end, became a manager of concerts which cost him and his backers much money. It was not necessarily *hinc illæ lacrumæ* (although the verdict of European musicians on America is nearly always in direct ratio to their financial success over here); but, at any rate, the lecture referred to was not pleasant for Americans to hear or read. Greatly enlarged, it has now been brought out in book form, under the name of "Unmusical New York," the author confessing that the more comprehensive title was misleading.

While the title of the book is even more offensive than that of the original lecture, the language is more conciliatory, and our virtues are not altogether overlooked. Mr. Klein admits that our audiences behave well. Not once did he hear an audience hiss or "boo" at a performer, or indulge in any direct manifestation of impatience or displeasure. American audiences are also as a whole "wonderfully quick to respond to the mood of the artist, . . . ready to recognize temperament and magnetism in

the performer. A more delightful public to sing or play before I have never encountered." Moreover, since the author admits that "America pays for genuine talent alone," we may infer that our audiences possess real powers of discrimination. Of our musicians, the organists appear to have made a particularly favorable impression; they are characterized as "a splendid set of musicians—capable, industrious, conscientious, and thorough."

In not one of his eleven chapters does Mr. Klein justify his use of "unmusical" as applicable to this city more particularly than to any European capital. The London *Telegraph* pointed out after he had delivered his lecture last autumn that, *mutatis mutandis*, he might as well have called his lecture "The Truth About Music in England." When Mr. Klein declares (p. 40), that it would be "supremely absurd" to say that New Yorkers "support music purely for the art's sake," as do the inhabitants of Manchester(!), Hamburg, Frankfort, Munich, Leipzig, and Brussels, where "the demand for music is the equivalent of a daily necessity," he indulges in language which itself is superlatively absurd. In the Proceedings of the Music Teachers' National Association, reviewed in these columns last week, Adolf Weidig remarks that chamber music, which is the severest test of musical culture, has in Germany "steadily lost ground, and not even the famous Bohemians can any longer draw a full house." That kind of music lacks sensationalism, and it is sensationalism that the modern German audience craves. New York is not quite as bad as that; our Kneisel Quartet always plays to a crowded house. As regards our orchestral concerts, Mr. Klein himself admits that "there is much thorough and sincere appreciation of the best that is to be heard in serious music. The classical masterpieces are beloved, and fine orchestral playing is intensely enjoyed."

As a matter of course, Mr. Klein has his sneer at New York as "the very hotbed of the star system," and he pities local amateurs for being "less concerned with works than with performers, with operas than with singers, with orchestras than with conductors." If he had added that we are less concerned with pianos than with pianists, with violins than with violinists, the foolishness of his reproach would have been obvious. A first-rate pianist at a second-rate piano is decidedly preferable to a second-rate pianist at a first-rate piano; and who would not rather hear "Rigoletto" with Tetrazzini and Renaud than "Tristan" with an ensemble of mediocrities who cannot do justice to it? There is not a city in Europe which would not be proud to be the "hot-bed of the star system." If the presence of nearly all the European artists of the first rank for five months a year has not done something to make New York a musical city, then there is no such thing as education in art.

Nor can we allow to go unchallenged the author's statement that much is done here for foreign and very little for native singers. There is absolutely no prejudice shown. As soon as an American singer attains to distinction abroad, he or she is engaged for the Metropolitan Opera House, as witness Eames, Nordica, Farrar, Homer, Martin, Hinckley, Whitehill, and many others. During the season just closed, there were included in the Metropolitan company, sixteen American singers, against eighteen Italians, twenty-one Germans and Austrians, twelve French and Russians, which is a very encouraging proportion. Henry W. Savage reversed the process, engaging untried American singers, many of whom are now prominent in foreign opera houses, as well as our own. What Mr. Klein says in regard to the deplorable state of choral music here is unfortunately true; also his assertion that New York has not a single great teaching institution. His most interesting chapters are those in which he tells the truth, as he sees it, about Maurice Grau, Heinrich Conried, and other operatic managers.

The Metropolitan Opera season, which ended last Saturday, will be memorable as the season during which the experiment was tried of having a double orchestra and a double chorus, thus making it possible to give simultaneous performances in New York and other cities. This experiment has proved so expensive that it will not be repeated. A sequel to it, however, is under trial in the West. This month Chicago is to be the operatic centre, with thirty-three performances by one wing or the other of the company, while the second wing appears in Baltimore, Pittsburgh, Cleveland, Toledo, Detroit, Milwaukee, St. Paul, St. Louis, Indianapolis, Louisville, and Atlanta. Most of the operas sung at the Metropolitan will be presented on this tour, with virtually the same casts.

Andreas Dippel, who directs this tour, will be the general manager of Chicago's new opera company next season. In the two years that he was administrative manager of the Metropolitan Company he did more than any one else to restore Wagner's operas to popular favor. They lead in the list of performances given at this house during the last twenty weeks, the figures being: Wagner, 31; Verdi, 24; Puccini, 18; Mascagni, 7; Leoncavallo, Massenet, and Ponchielli, 6 each; Gluck and Gounod, 5 each; Franchetti, Humperdinck, and Tchaikowsky, 4 each; Donizetti, Auber, and Flotow, 3 each; Weber and Converse, 2 each; Bellini, 1. At the New Theatre (which will be purely a playhouse hereafter) twenty operas were performed in Italian, fifteen in French, seven in German, one in English.

At the Manhattan Opera House French opera played a much more important part than at the Metropolitan, where there were only 14 French performances, against 45 German and 82 Italian. Mr. Hammerstein's list includes 53 performances of operas by French composers (Massenet, Audran, Bizet, Maillart, Planquette, Gounod, Saint-Saëns, Charpentier, Debussy, Delibes), against 41 by Italians (Verdi, Mascagni, Leoncavallo, Donizetti, Puccini), and 22 by German composers (Wagner, Strauss, Offenbach). The German operas were sung in French, as was also "Lakmé." "Elektra" was given seven times, "Salome" four times.

William Candidus, who had sung tenor rôles in grand opera, presented in English in this city—especially Lohengrin, at the Academy of Music, in 1886, and Nero, at the Metropolitan Opera House, in 1887—died at Frankfort-on-the-Main last week, at the age of sixty-nine. He was born in Philadelphia, and served in the Union army for two years during the civil war.

Edouard Colonne, the French musical conductor, died last week, at the age of seventy-one. He visited America in 1868-69 as concert master of the opera-bouffe company managed by Col. James Fisk, jr., and conducted concerts of the Philharmonic Society of this city in 1903 and 1904. In 1892-93 he was leader of the orchestra of the Grand Opera in Paris.

Art.

A History of Architecture. By Russell Sturgis. Vol. II. Romanesque and Oriental. New York: The Baker & Taylor Co. xxxii+488 pp; 392+5. Illustrations. $5.

This comes to us as a posthumous work, prepared for publication by the author's son, D. N. B. Sturgis, and by Prof. A. L. Frothingham, from manuscripts nearly completed before the author's death last February. It is a worthy legacy from the most distinguished, as he was the most prolific, of American writers on architecture and the allied arts. In synthetical grasp and presentation, in breadth of view and comprehensiveness of treatment, in historical perspective, and proportion, this volume marks a notable advance over the first, which appeared some two years ago. It covers the history of Oriental and mediæval architecture, down to the twelfth century, or rather to the period when what we call Romanesque architecture began to develop clearly into what we call the Gothic. Asiatic architecture of both the non-Moslem and Moslem styles, the Early Christian or Latin, the Byzantine, and the Romanesque styles form the subject-matter of this volume, leaving the entire Gothic development and the Renaissance and modern styles for the third volume.

The arrangement and sequence of subjects treated seem a little confusing at first sight. Book vi, the first in this volume, is devoted to the non-Moslem architectures of Asia. It is not quite clear why they are thus interjected between the Roman chapters with which the first volume concludes, and the seventh book,

on "The Styles Resulting from the Decline of Ancient Art." It should seem as if the subject matter of book vi might better have been left to the end of the entire history, where it would not interrupt the historical sequence. The early basilicas, churches of radiate plan, the Byzantine influence, and Byzantine monuments occupy the seventh book; and this is followed, as chronology and historical relations agree in prescribing, by the Moslem monuments in Syria, Egypt, North Africa and Spain, Persia and India, Sicily and Spain. The dividing of the text on the Spanish Moslem work into two sections in separate chapters is hardly warranted. The Turkish Moslem architecture is wholly omitted, probably for chronological reasons, but the wisdom of thus relegating it to the third volume is questionable, and the reader seeking for some mention of it or reference to its proposed assignment to the later volume will be disappointed. The eighth book takes up the later Romanesque of Italy; the ninth and last, the later Romanesque of France, Great Britain, Germany, Spain, Scandinavia, and Armenia. Most treatises classify the Armenian monuments with the Byzantine, but Mr. Sturgis has preferred to consider them as Romanesque, and not without good reason.

Nearly all the subjects covered by these four books were peculiarly congenial to Mr. Sturgis's taste and turn of mind. The splendid decorative quality of all the Moslem styles appealed to his love of the arts of pure design, while the intellectual quality, the dominance of reason and logic in seeking and applying means to architectural ends, in the mediæval styles of western Europe, strongly attracted his analytical mind. This volume was evidently written *con amore;* it embodies the enthusiastic study of a lifetime, and there is in general excellent proportion between its various subjects, no one subject or section being slighted in favor of another. Each book is prefaced or introduced by a brief historical sketch of the period treated, and these outlines are models of condensed statement and broad, graphic characterization.

In all the various sections of this volume, however, Mr. Sturgis is the examiner, the analyzer, the critic, rather than the historian. Thus, for instance, of the six and one-fourth pages given to the historical introduction to Moslem Architecture (Book viii), three and one-half are occupied with an analysis and description of various forms of the arch. The marvellous sweep of the Mohammedan conquests in the seventh and eighth centuries, the overwhelming of the Byzantine, Persian, and Mediterranean civilizations over vast areas by a race of nomads, and the singular processes by which in a short time under these conquering non-builders wholly novel and surprisingly rich architectures were developed—all this is disposed of in two and three-fourths pages. This is not meant as a hostile criticism; it is simply an illustration of an attitude deliberately taken and consistently maintained. Mr. Sturgis cared little for, or at least did not care extensively to treat, the details of style-evolutions, of historical influences and transmissions, upon which archæologists and many historians of art love to dwell. His interest was in the buildings themselves: their plan, construction, *raison-d'être*, their excellences and defects. But less space is given to the structural evolution of the later Romanesque styles, the genesis and varying forms of vault, spire, and buttress, of clustered pier, recessed doorway, and apsidal chapel, than one would have expected of a writer so gifted in analysis, and less, it seems to the reviewer, than the subject really demands. Thus the problem of nave- and aisle-vault buttressing is referred to quite incidentally in a number of individual instances, as, for example, in connection with St. John's in the Tower, London (p. 370); but nowhere is this problem, so fundamental to the whole later Romanesque development, alike in France and England, discussed comprehensively as a topic by itself. So also of the problem of the oblong vault-bay, referred to in connection with the Abbey Church at Vézelay (p. 352). It would thus appear that the writer's interest was always centred on the particular building more than upon its place in the great and general onward movement of architectural development which gave it its form and details. The space assigned to the Anglo-Norman buildings is perhaps sufficient, but might well have been more generous—seventeen pages only as against fifty-nine for the French Romanesque, and twenty-four to Germany. There is no reference to the secular and military buildings of the Romanesque period.

The references to restorations are frequent and judicious. This aspect of the subject is too often ignored in historical treatises of a comprehensive character.

This second volume of the three projected by its author must remain the final monument of his literary activity, and the most serious and valuable of his works, with the possible exception of "The Artist's Way of Working." It is written in a simple and unaffected style, less discursive than that of the first volume, and gives us the maturest judgments of the author's ripest years. Controversial matters are avoided or referred to by a brief presentation of both sides. The 392 illustrations are well selected, with a fair proportion—which would have borne increasing without injury—of plans; they are well presented and are genuinely illustrative and helpful to the text. The sources of the illustrations are very carefully indicated. There is a table of contents and a list of illustrations, but no index either of places or topics—an unfortunate omission, unless to be supplied in the final volume of the series. The publishers have done their work well, producing a handsome volume, which opens out in a truly comfortable way, and is well printed on a heavy plate paper.

THE INDEPENDENT ARTISTS.

As an exhibition that has almost grown over night, that of the Independent Artists is remarkable. In spite of artificial light, the lower gallery is impressive. One feels at ease with the whole, and sees the individual pictures, each of which has its own electric light, in all comfort. On the second and third floors, it has been difficult to bring the numerous small pictures into decorative unity. The show has grown in an interesting way. A number of artists, for one reason or other out of touch with the Academy, formed a committee and invited a number of men of like minds to send in pictures and pay their shot. There is no jury and a minimum of organization. An old dwelling house has been reduced to a shell, and affords ample wall space. Evidently there are plenty of people waiting for the chance to exhibit, for in a single day 260 paintings and 344 drawings were loaded upon the devoted shoulders of the hanging committee.

How one takes the show itself is largely a matter of temperament. Many, of whom is the present writer, will find it rather variously diverting and disappointing. It is distinctly more amusing than the Academy ever is; it also reveals an amount of rather empty self-assertiveness such as never cumbers the Academic walls. Some of the best exhibitors are Academicians. Robert Henri, whose influence is pervasive, is a full-fledged N.A.; George Bellows, W. J. Glackens, and Ernest Lawson are prominent A.N.A.'s. George Luks, who ought to have been the lion of this show, is preparing an exhibition which he has declined to discount, even for the public good. Now, if such contributions as Henri's Salome Dancer—a vivid perpetuation of a moment hardly worth eternizing on this scale; Lawson's admirable White Horse in a riverscape, Bellows's gory prize fights and remarkable architectural composition, Glackens's race-course, playground, and nude were withdrawn, the glory of the exhibition would have departed. In other words, the best contributors to the anti-academical demonstration are by men the Academy has delighted to honor.

Still the residuum would quite justify the enterprise. It is a pleasure to see A. B. Davies torn from precious surroundings and exposed to the average chance. He stands the test well. His picture As Movement of Water is one

of the memorable impressions. In a narrow channel deeply blue waves, as they race through, are tossed back upon themselves; beyond is a pearly and serrated mountain. In the foreground little nudes unconsciously mimic the rush and backset of the waves. Here is a real vision carried out with perfect clearness. Work of this character is rare anywhere. We advise a visitor to adjust his eye by this picture. It will help him to see that much of the most emphatic work is weak and vague expression of something imperfectly visualized. Everett Shinn's vivacious studies of dancers and actors, Jerome Myers's poignant transcripts from the Ghetto, John Sloan's sub-satirical versions of the East Side themes—these names recall tried pleasures; it is merely advantageous to see this work well hung and in a large company.

Among those who are wearing the shoes of Cézanne, the most skilful are Prendegast, Blashki, and Schamberg. In sacrificing his old staccato precision in favor of greater bulk, it may seem that Prendegast is substituting a less for a more congenial product. Time will tell. Blashki's three seasonal studies, Summer, Autumn, Spring, are beautiful in color, and ring true in tone.

Rockwell Kent is willing to take a hint from so old-fashioned a body as Winslow Homer. Mr. Kent's big road roller, with its straining horses, and his two marines are large in scale, and vigorous enough for anybody whose daily food is not Dorothy Rice's nightmares from the slums. From the emphatic persons who, to judge by their works, paint in horrid orgasms, one turns to the brooding spirits. Mr. Swett's crystalline Château Gaillard, with its exquisitely adjusted planes, J. B. Yeats's sensitive portrait of a bearded old man, James Preston's vernal river bank with little girls bathing, Nankivell's alluring park scene with Liliputian players so alertly spotted in—these were the things that called one away from the general atmosphere of excursions and alarums.

In sculpture, Gutzon Borglum's colossal head of Lincoln lords it. So touching is its character of strength, tempered by benignity, that it would not be surprising if the people should accept it as the standard portrait of their greatest representative. James W. Fraser's portraits, and Albert Humphreys's animals are otherwise, perhaps, the most interesting sculpture exhibits. The entire top floor has been devoted to drawings and etchings. Glackens shows the pastel sketch for his big nude, downstairs. It is a fine study and an excellent lesson in scale. Henri's caricatures represent a side of his talent unknown to the public. They are capital in character and economy of means. For sheer drastic character, Jerome Myers's and George Bellows's slum sketches are extraordinary. Mr. Bellows, in fact, forces expression to the danger point. John Sloan's etchings for Paul de Kock's novels have as much character and less naïveté. The line is at once sensitive and austere, the mood realistic but supremely elegant. It is illustration and draughtsmanship of a high order. Glenn O. Coleman and May Preston Wilson, popular illustrators both, are represented by large groups of drawings. Leon Dabo's studies in miniature seem more interesting than his pictures. Two big drawings from the nude, by Gutzon Borglum, have a large accent.

The show is so large that one is easily lost in casual observation. The half would be better than the whole. On the smaller issue, do we need a large annual exhibition beside the Academy? there can be only one answer: We do. Here is a great deal of vivacious or positively accomplished work that for one reason or another is never seen in the Academy and rarely elsewhere. On the large issue, is this ferment of issues promising a new and finer art? it would be sheer folly to give a dogmatic answer. The instinct of one old-fashioned writer is that there is more green, yellow, and red sickness about than positive talent.

F. J. M.

Of the excellent translation of Gaston Migeon's "Au Japon," by Florence Simmonds, entitled "In Japan: Pilgrimages to the Shrines of Art," we need only remark that in illustration and typographical form the English version follows closely the French original edition. It will fit a fairly capacious pocket. It is published conjointly by William Heinemann of London and J. B. Lippincott Company of Philadelphia.

"The Evolution of Italian Sculpture," by Lord Balcarres (Dutton), is one of those fairly good books which leave one asking why they are not better. The author has produced a comprehensive history of style somewhat after the model of Wölfflin's admirable studies of the Renaissance. There are many good illustrations skilfully grouped to show the progress of the art. But style is too often taken in its more obvious and superficial features of anatomy and iconography. Moreover, Lord Balcarres's manner, while dignified, lacks salience. As the paragraphs run their placid course into chapters, one thing seems about as important as another, and no enduring impression is made upon the imagination. This is a pity, for the book is independently conceived and combats certain accepted views. In asserting that the Renaissance was more influenced by the idea of the antique than by specific monuments, we think a valuable point of view is suggested, but the visible remnants of Roman antiquity are underestimated. Not merely the storied columns at Rome and the Horse Tamers spoke eloquently through the centuries of the glory that had been, but high and low in Italy Roman capitals, mouldings, sarcophagi, told the same story and afforded the same opportunity. Where this book seems weakest is in the treatments of the early Renaissance. We miss any adequate statement of the interrelation of bas-relief and graphic design. Much that is said of Michelangelo is excellent, and the treatment of the later barock is sympathetic and novel. Michelangelo, however, should not be set down as a poor portraitist for his purely symbolic effigies of Lorenzo and Giuliano de' Medici. There is some carelessness in attributions and in the printing of proper names: Verrocchio and Pinturicchio repeatedly turn up with their r's and c's ill distributed. In the chapter on portraiture the remarkable thirteenth-century heads outside the Pisan Baptistery should have been mentioned. In their keen characterization they mark a stage toward actual interpretation of individual faces. Venturi attributes them to the great Niccolò, whom pretty much everybody but Lord Balcarres now concedes to be an Apulian. In general the execution of this book falls below the expectations aroused by its ambitious design.

"J.-B. Isabey: Sa Vie—Son Temps" is one of those beautifully printed, lavishly illustrated, and well documented in-folios which the French love to provide for well-to-do amateurs. The author, Mme. de Basily-Callimaki, has fully exploited the personal and biographical interest of a life-work including the whole Napoleonic era, with the Bourbon restoration, the Orleans interregnum, and the beginnings of the third Bonaparte. Never a great painter, in portraiture, and especially in miniature, Isabey had his happy moments. In a rather dull time as regards technic he kept alive the tradition of Gallic vivacity. In his maturity he was flexible enough to adopt the Romantic technic and feeling. He turned his hand to anything, from a huge historical "machine," to a Sèvres plate, or the back-scene of an opera, and everything he did more than commonly well. To him we owe some of the most revealing portraits of Napoleon, especially that unconscious satire, the Emperor in wedding costume; the pathetic figure of the little Duc de Reichstadt, and many a hint of the fair frailties that enlivened war's intervals. Isabey was loved. Metternich wrote when the painter left Vienna: "You who so readily have grasped the traits of your friends will also know how to remember them." In all a thoroughly amiable and representative figure of an eminently genial time. This volume is imported by Lemcke & Buechner and published in only 550 examples, of which 50 are on Japan vellum.

Finance.

SIGNS OF THE TIMES IN INVESTMENT FINANCE.

Two aspects of the financial situation of the day are challenging particular attention, in the present somewhat perplexing posture of affairs. One is the rise in operating expenses of our great investment corporations; the other is the increasing difficulty of finding a ready market for the unprecedented mass of new securities issued by these companies. The underlying cause is pretty much the same in both cases, and both have been discussed in a striking manner, this past week, by high authorities in railway finance.

Within a month, the New Haven, the Pennsylvania, the Reading, and the Baltimore and Ohio Railways have granted, to a substantial part of their working-forces, increase in wages ranging from 6 to 10 per cent. Conferences between company and employees, with a similar end in view, have been held by the New York Central, Erie, Lackawanna, Lehigh Valley, and Delaware and Hudson. Perhaps the most frequent and most obvious comment on the episode has been the remark that wages of the relatively poorer-paid employee were advanced to meet the advancing cost of living. It has also been suggested that, by increasing wages, the purchasing power of the masses would be enhanced, and that thereby trade prosperity would be increased.

Last week, the president of the New York Central voiced still another inference. Beginning with the statement, not new on the part of railway officers, that "a general advance in freight rates, such as will enable the roads to carry the additional burden, is the logical next step," Mr. Brown concluded with the assertion that "if the railways are to remain solvent, the only recourse now is an advance of freight rates." Inasmuch as the establishing of such higher rates is always more or less a matter of doubt, one might have imagined that so extraordinary a prophecy, from a high railway official, would have been followed promptly by disaster in the market for railway shares. Nothing of the sort occurred—which indicated either that investors were not taking Mr. Brown's prophecy altogether seriously, or that over against his pessimistic prediction they set his company's increase in its annual dividend, two weeks ago, to the highest rate paid in a quarter of a century, or else that they believed higher freight charges would come if the necessity were proved, though possibly not otherwise.

A second incident of the week had to do with the investment market. In a speech to the Merchants' Club of Chicago in November, 1906, James J. Hill declared that, in order to escape a commercial paralysis which, "long continued, would mean slow commercial death," the railways of this country must have $1,100,000,000 new capital per annum during the next five years. Last week, Mr. Hill reiterated his prophecy of 1906, but raised his estimate of annual requirements from $1,100,000,000 to $1,600,000,000, and extended the term for such annual outlay to six years, adding:

> This country is up against a stone wall, and it can't see either end or over. We might come in contact with a comet and survive the shock, hut we cannot go on with our railroads in their present condition. The importance of the subject is not realized. To my way of thinking, it is of more importance than a total failure of crops.

As to where the railways were to get such a sum of money, Mr. Hill had no suggestion to make; he believed, however, that failure to provide the annual $1,600,000,000 would spell calamity.

There are manifestly two distinct questions arising from such a statement. First, is it trne that the railways positively must raise this stupendous sum? Secondly, can such a sum be obtained in the investment markets? *Poor's Manual* gives these figures for the annual additions to outstanding stocks, bonds, and other securities of the American railways, reckoning by fiscal years:

1908	$723,473,146	1903	$671,095,998
1907	907,864,112	1902	527,435,776
1906	1,030,349,026	1901	434,589,187
1905	481,443,565	1900	199,085,273
1904	556,133,066	1899	107,748,030

Figures for 1909 are not yet compiled, but they are expected to exceed all other years. As the above figures stand, they indicate that the borrowings of our railways during 1906, on account of new capital, were greater by 400 per cent. than the borrowings of 1900, and that Mr. Hill's new estimate, if realized, would make the average annual capital issues, from 1910 to 1915 inclusive, exactly 200 per cent. larger than the annual average from 1901 to 1906 inclusive. Yet the country's population to-day, as estimated by the government, is only 16 per cent. larger than at the beginning of 1901. The country's clearing house exchanges, which reflect its traffic and production, broke all records in 1909, but the year's total exceeded by only 40 per cent. the total of 1901. Some allowance must undoubtedly be made for the advance of 20 per cent. since 1901 in average commodity prices, by the *Bradstreet* estimate; for railways, as well as other people, have to pay more than before for the same materials. But even so, we are very far from showing any such expansion as on its face would warrant Mr. Hill's estimate of indispensable capital requisitions.

As for the second question—whether the $1,600,000,000 per annum will be provided by the money market—the signs of the moment certainly do not indicate that this can be expected on the former terms. The investment market, like other markets, is governed in its attitude by supply and demand, and supply has to all appearances far overrun the normal demand. At a price (measured either in higher interest rate on bonds, or at a heavier discount in the selling price) the capital might be had. Such high-grade borrowers as the British Exchequer, the United States Government, and the City of New York, have been confronted with a similar dilemma, and have met it by offering their bonds on more inviting terms. But the railways do not wish to make such concessions; hence, perhaps, the partial deadlock in the market. The ordinary outside observer, mindful, perhaps, of his personal experience, would be inclined to suggest either that the railways should revise their rapidly mounting schedule of expenditure; or else, if they will not do without this enormously increased total of new capital, that they should make up their minds to pay the price.

BOOKS OF THE WEEK

Aicard, J. Maurin. Translated by A. Allinson. Lane Co. $1.50.

Andreiyeff, L. A Dilemma. Philadelphia: Brown Bros. $1.

Ardagh, W. M. The Magada. Lane Co. $1.50.

Baedeker's Great Britain. Seventh edition. Scribner. $3 net.

SOME NEW AND FORTHCOMING BOOKS.

In the American Nature Series.

Fernow's The Care of Trees in Lawn, Street and Park

By B. E. FERNOW, Professor of Forestry in the University of Toronto, author of "Economics of Forestry," etc. 377 pp. and Index. Illustrated. Probable price, $2.00 net. *Ready April 23rd.*

Written for amateurs by a forester, this volume furnishes information such as the owner of trees or the "tree warden" may need. It is the only collective and comprehensive manual on the subject.

Albee's Hardy Plants for Cottage Gardens

By HELEN R. ALBEE. Illustrated. About 400 pp. Probable price, $1.60 net. *Ready May 7th.*

A personal and very readable record of the author's success in assembling within a limited area the choice varieties of hardy shrubs, annuals, and perennials, so arranged to give a succession of bloom of pure color in each bed. With a list giving manner of growth, height, time of blooming, exact color, special requirements of soil and moisture, "easy ways" taught by experience, and many et ceteras of vital importance.

Kellogg's The Shellfish Industries

By the Professor of Biology in Williams College. Illustrated. $1.75 net.

Covers the classification, structure, life-histories and habits of our food-molluskes, with a comparison of culture methods.

"Interests all classes. Full of astonishing and entertaining information. . . . The science is accurate, and in some points new."—*N. Y. Sun.*

Doane's Insects and Disease

By R. W. DOANE, Assistant Professor of Entomology in Stanford University. With many illustrations and an annotated bibliography. About 270 pp., large 12mo. Probable price, $1.50 net. *Ready May 7th.*

A Popular Account of the Way in Which Insects May Spread or Cause Some of Our Common Diseases.

Prospectus of this series on request.

La Monte and Mencken's Men vs. The Man

Friendly letters for and against Socialism actually exchanged between Mr. La Monte, editor and Socialist of New York, and Mr. Mencken, editor and Individualist of Baltimore. $1.35 net.

New Fiction.

Skid Puffer—A Tale of the Kankakee Swamp

There is racy rural humor of a new sort. The characters are truly American, the incidents are thrilling, and there is a good love story. .

Blackwood's The Education of Uncle Paul

By Algernon Blackwood, author of "John Silence." $1.50.

A seemingly crusty bachelor is led by his nephews and nieces into the world of children's fancy.

The London Spectator says: "Marked by a sense of beauty and a wealth of poetic invention. There is humor. An uncommon book."

George Cary Eggleston's Recollections of a Varied Life

By the author of "A Rebel's Recollections," "A Daughter of the South," etc. With portrait. $3.00 net. *Ready April 16th.*

These reminiscences of the veteran author and editor are rich in fields so wide apart as the experiences of a hoosier schoolmaster (the basis for the well-known story), a young man's life in Virginia before the War, a Confederate soldier, a veteran in the literary life of New York.

In the Leading Americans Series.

Edited by W. P. TRENT.

Erskine's Leading American Novelists

By JOHN ERSKINE, author of "The Elizabethan Lyric." $1.75 net. *Ready April 16th.*

Critical biographies of Charles Brockden Brown, James Fenimore Cooper, William Gilmore Simms, Nathaniel Hawthorne, Harriet Beecher Stowe, and Bret Harte.

Payne's Leading American Essayists

By WILLIAM MORTON PAYNE, author of "The Greater English Poets of the 19th Century." Probable price, $1.75 net. *Ready April 23rd*

The rather lengthy introduction presents a historical survey of the minor American essayists. Irving, Emerson, Thoreau, and Curtis receive separate and extended biographical and critical treatment.

Stephenson's The Elizabethan People

By Henry Thew Stephenson, author of "Shakespeare's London." 70 illustrations. $2.00 net.

New York Sun—"So well expressed, so reasonable and effective, so satisfying in many particulars . . . this excellent book."

Showerman's With The Professor

Cheerful and sane essays dealing with various aspects of college life and education in general. $1.50 net.

"Wit not too erudite, and fancy not too riotous. The keynote of the book, a sort of cheerful derision, or gleeful sarcasm, or good-humored pessimism, punctuated with all manner of droll conceits, odd quips, and playful sallies. But there's many a serious word said in all this jest; and it is so well said, with so apt and evidently unstudied employment of classic quotation and neat literary allusion."—*The Dial.*

Hamilton's The Theory of the Theatre; and Other Principles of Dramatic Criticism

By CLAYTON HAMILTON, author of "Materials and Methods of Fiction." $1.50 net. *Ready April 16th.*

The Contents include: The Theory of the Theatre.—The Psychology of Theatre Audiences.—The Actor and the Dramatist.—Stage Conventions in Modern Times.—The Modern Social Drama.—The Public and the Dramatist.—Dramatic Art and the Theatre Business.—The Happy Endings in the Theatre.—Dramatic Literature and Theatric Journalism.—The Effect of Plays upon the Public.

HENRY HOLT AND COMPANY, 34 West 33d Street, New York

COLUMBIA STUDIES IN HISTORY, ECONOMICS AND LAW

New Volume (Vol. XXXVI, No. 1)

Reconstruction in Texas

By CHARLES WILLIAM RAMSDELL, Ph.D.

Sometime University Fellow in Columbia University Instructor in History, University of Texas Fellow and Corresponding Secretary and Treasurer of the Texas State Historical Association.

8vo. 324 *pages, price* $2.50, *paper covers; or bound in cloth,* $3.00.

LONGMANS, GREEN, & CO., New York

Orpheus

A General History of Religions

By SALOMON REINACH, Author of "Apollo," etc.

8vo, with Colored Frontispiece, $3.00 net.

"The volume gives ample proof of that wide erudition which we expect from this author. . . . The style of the book is delightfully epigrammatic. . . . Beginning with theories of anthropology and myth, M. Reinach states with persuasive skill many debatable dogmas. . . . He generalizes with all the grace of an accomplished English scholar. . . . The bibliographies testify to the wide range of the author's investigations."—*London Athenaeum.*

G. P. PUTNAM'S SONS, NEW YORK & LONDON

Are You Plus or Minus?

Answer after reading the little book whose fame is spreading like wildfire:

SELF-MEASUREMENT

A Scale of Human Values, with Directions for Personal Application.

By WILLIAM DE WITT HYDE, President of Bowdoin College.

All bookstores, 50c. net; by mail, 55c.
B. W. HUEBSCH, Publisher, New York.

LIBRARY RESEARCH

Topics of all kinds and in any language looked up in the Boston and Harvard libraries for scholars, writers, and others. Abstracts, copies, translations, and bibliographies made. Proof-reading and revision of manuscript. Highest university and library references.

MISS M. H. BUCKINGHAM,
96 Chestnut Street, Boston, Mass.

FOUR MOMENTOUS NEW BOOKS

Karl Marx: His Life and Work by JOHN SPARGO. $2.50 net. For a dozen years the author has been gathering his material and writing this monumental biography of the founder of modern Socialism. Its importance justifies the prediction that the book will be accepted as the most notable biography of 1910. Fully illustrated.

The Development of Christianity by OTTO PFLEIDERER, D.D., translated by Daniel A. Huebsch, Ph.D. $1.50 net. This is the last work of the famous scholar, and completes the trilogy of books of popular lectures, the first two being "Christian Origins" and "Religion and Historic Faiths."

Latter Day Sinners and Saints by EDWARD A. ROSS, Professor of Sociology at the University of Wisconsin. In The Art of Life Series. 50 cents net. This is a further development of the thesis of the author's earlier volume, "Sin and Society," which was so successful about two years ago. Professor Ross's keenness in analyzing social disorders and fearlessness in prescribing remedies are always stimulating.

Health and Suggestion: THE DIETETICS OF THE MIND, by ERNST VON FEUCHTERSLEBEN. Translated in its entirety and edited by Ludwig Lewisohn. $1.00 net. This is regarded as a classic in Europe. It was written in the first half of the nineteenth century by a famous professor of medicine in Vienna, and has a peculiar interest for the present day, for it was the fruit of the psychotherapeutic movement which parallels the one that is receiving so much attention in our time. *Dr. Worcester of the Emmanuel Movement says of this book:* "It contains the principles of our whole project, and expresses many phases of our thought better than we are able to express it."

This complete translation is not to be confused with a so-called adaptation of Feuchtersleben's classic.

IMPORTANT BOOKS

PETRARCH'S LETTERS TO CLASSICAL AUTHORS. Translation and Commentary by MARIO E. COSENZA.

Professor Cosenza has preserved in his translation the air of delightful intimacy with which Petrarch addressed the classical authors. The great Italian knew the classics and the personalities back of them. In discussing the writings of Cicero, whom he accused of weakness of style and too freo invective, he said: "I could not restrain myself, and indignation prompting me I wrote him as a friend of my years and time, regardless of the ages which separated us. Indeed I wrote with a familiarity acquired through an intimate knowledge of the works of his genius, and I pointed out what it was that offended me in his writings." Professor Cosenza's translation is easy and graceful, and his notes supply the historical and literary data needed as a background to the text. The attractive little volume will win many new friends for Petrarch and will be welcomed by those who already know his very human "Letters." 224 pages, 16mo, cloth; net $1.00, postpaid $1.09.

THE EDUCATION OF WOMEN. By MARION TALBOT.

In this book Professor Talbot shows how tho educational system needs to be modified, extended, and revised to suit the changed occupations, interests, and responsibilities of women. Part I is a survey of the remarkable changes in the status of women along industrial, educational, civic, philanthropic, domestic, and social lines. Part II describes the educational machinery of the present day in elementary, secondary, and collegiate grades; and Part III is rich in plans for meeting women's needs in academic training, hygienic education, social activities, and domestic life, with special reference to the college period, based on Professor Talbot's long experience. For thirteen years, the author was an officer of the Association of Collegiate Alumnæ. Since 1892, she has been Dean of Women at the University of Chicago. The book contains 266 pages, 8vo, and is published at $1.25 net, $1.37 postpaid.

BOCCACCIO AND HIS IMITATORS. By FLORENCE N. JONES.

A collection of the titles of books founded on Boccaccio. The volume reports exhaustively on the authors who have taken much or little from the Decameron and brings together for the first time tangible evidence of the extent of Boccaccio's influence. The student who seeks to know how all literature has been affected by the work of this one man is able through this list to trace effectively his power. 46 pages, 8vo, paper; net 50 cents, postpaid 53 cents.

THE TREATMENT OF NATURE IN ENGLISH POETRY. By MYRA REYNOLDS.

When Dr. Johnson declared that "a man tired of London is tired of life," he epitomized the attitude of his age. The effect of this narrow artificiality on English poetry is ably described in this book. It is an exhaustive investigation into the works of the greater and lesser poets who wrote between the middle of the seventeenth and the end of the eighteenth centuries. The beginning and slow development of a real nature-sense are acutely traced and brought into relation with other activities of the time. The book is illustrated with copies of contemporary paintings which show more clearly than words the extent of the artist's feeling for nature. 410 pages, 8vo, cloth; net $2.50, postpaid $2.70.

SOURCE BOOK FOR SOCIAL ORIGINS: ETHNOLOGICAL MATERIALS, PSYCHOLOGICAL STANDPOINT, CLASSIFIED AND ANNOTATED BIBLIOGRAPHIES FOR THE INTERPRETATION OF SAVAGE SOCIETY. By WILLIAM I. THOMAS.

The papers forming the body of the book are by such eminent modern anthropologists as Boas, Tyler, Westermarck, Spencer and Gillen, Haddon, and Rivers. The author has an introductory chapter on the standpoint from which the materials are to be viewed, and critical comments are appended to each part. There are seven parts: (1) External Environment (Anthropogeography and Primitive Economics); (2) Primitive Mind and Education; (3) Early Marriage; (4) Invention and Technology; (5) Art, Ornament, and Decoration; (6) Magic, Religion, Ritual, and Ceremonial; (7) Social Organization, Morality, and the State. The extended Bibliographies form the chief feature of the book. 920 pages, 8vo, bound in buckram, gold stamped, sewn on tape; net $4.50, postpaid $4.77.

EZRA STUDIES. By CHARLES C. TORREY.

Professor Torrey's work in this literature began thirteen years ago with the publication of a pamphlet entitled *The Composition and Historical Value of Ezra-Nehemiah*, a treatise which was largely destructive of the accepted versions of the Ezra story, and which flatly contradicted most of the fundamental tenets of modern Old Testament science in its field. The author perceived that a thorough revision of the existing notions of the history of the Jewish people in the Persian period, their institutions and their religious ideas was inevitable, and began work on the series of studies which resulted in the present book, each chapter of which is constructive. 340 pages, 8vo, cloth; $1.50 net; postpaid $1.69.

BIBLICAL IDEAS OF ATONEMENT: Their History and Significance. By ERNEST DEWITT BURTON, JOHN MERLIN POWIS SMITH, and GERALD BIRNEY SMITH.

This book sets forth the content of the biblical teachings upon the subject of Atonement, and suggests the point of view from which these conceptions may profitably be studied at the present day. The attitude assumed toward the records throughout is that of historical interpretation rather than of theological systematization. Consequently, the effort is to discover precisely what ideas of atonement are reflected by the biblical laws, institutions, and utterances. The authors employ the historical method throughout. To trace the history of an idea is to discover the forces that have coöperated to produce it and to transform it from age to age. The history of the idea is thus its best explanation. Yet as many readers will desire, not only a historical statement of what was believed and taught by the prophets and teachers of old, but also some indication of the value of those teachings for the present day, the closing section of the book (chap. xii, xiii) is devoted to this aspect of the matter. 338 pages, 12mo, cloth; net $1.00, postpaid $1.11.

PRIMARY ELECTIONS. By C. EDWARD MERRIAM.

For students of American political history, and especially of American party history, this volume will be particularly valuable. It gives a clear account of the various laws and cases and a critical discussion of the present primary question. The absence of literature on this subject makes the appearance of the book especially timely. Many general readers as well as the special students will find it of interest. 300 pages, 12mo, cloth; net $1.25, postpaid $1.35.

ADDRESS DEPARTMENT 21

THE UNIVERSITY OF CHICAGO PRESS

THOMAS Y. CROWELL & COMPANY, NEW YORK

Memoirs of Henry Villard

Journalist and Financier

1835-1900

Two volumes, with Portraits and Maps, $5.00 *net.* Postage, 35 cents.

An autobiographical record of the varied and romantic career of the war journalist who subsequently became a power in the financial world, and carried the Northern Pacific Railroad to completion. Full of incident and valuable for its reminiscences of Lincoln and other prominent men of the time, as well as for its descriptions of important battles of the Civil War.

"A book of extraordinary interest. It is written with great ability, in a clear and flowing style; it details with perfect candor the incidents of a great career; it is an admirable report of great events, all of which the writer saw, and a large part of which (after 1870) he was; it exhibits the rise and growth of a rich and powerful personality and a character at once remarkable for its simplicity and its variety."—JOHN WHITE CHADWICK, in the *New York Times* Saturday Review.

"This posthumous autobiography of the late Henry Villard is a work of exceptional interest."—*Commercial and Financial Chronicle.*

20 VESEY ST. The Nation NEW YORK

Little, Brown & Company's Spring Publications

ONE OF THE SEASON'S SIX BEST SELLERS

PASSERS-BY

By ANTHONY PARTRIDGE

A splendid specimen of the story of mystery and action. —*Chicago Record-Herald.*

Mr. Partridge is now reckoned among the favorite novelists of the day.—*Cincinnati Commercial-Tribune.*

The first chapter compels the absorbed interest of the reader and lays the groundwork for a thrilling tale in which mystery follows upon mystery through a series of dramatic situations and surprises.—*Philadelphia Press.*

Illustrated by Will Foster. $1.50.

The Up Grade

By WILDER GOODWIN

The regeneration of man by love.

Interesting and convincing. Shows both artistic insight and an understanding of character. —*New York Times.*

Illustrated by Charles Grunwald. $1.50.

The Snare of Circumstance

By EDITH E. BUCKLEY

Baffling and amazing.

A closely woven, fascinating mystery story, which keeps the reader forming new theories, and which unfolds a conclusion differing from any of the theories. —*St. Louis Post-Dispatch.*

Illustrated by Arthur E. Becher. $1.50.

Over the Quicksands

By ANNA CHAPIN RAY

This author's most pretentious and serious story.

Many intense situations and not a little dramatic force in the way in which the story is developed. —*New York Times.*

Frontispiece by Harriet Roosevelt Richards. $1.50.

The Red House on Rowan Street

By ROMAN DOUBLEDAY

Wholesomely mysterious.

A dashing story, and characters that are presented with unusual cleverness, while the startling events command the reader's absorbed attention.—*Philadelphia Press.*

Illustrated by William Kirkpatrick. $1.50.

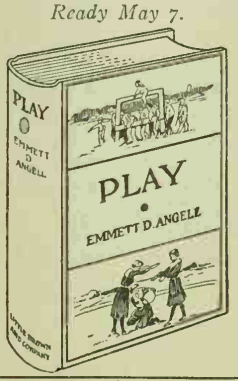
Ready May 7.

Play

By EMMETT DUNN ANGELL

This book, the most practical one of the kind published, contains descriptions of and instructions for playing over a hundred games carefully graded, including water sports, suitable for both indoor and outdoor use; also invaluable details for coaching and playing girls' basketball.

Over fifty illustrations from photographs.



Play

By EMMETT DUNN ANGELL

These games may be utilized by the physical instructor, the play-ground instructor, the public school teacher, the kindergartner, and the parents; and children themselves may easily work them out and enjoy them. Mr. Angell has selected all his games because of their contribution to the health, strength and grace of the players.

$1.50 net.

Caleb Trench

By MARY IMLAY TAYLOR

The impressive story of a Northerner's stubborn fight against class prejudice in the South. Contains a most delightful love theme.

Frontispiece by Emlen McConnell. $1.50.

Just Between Themselves

By ANNE WARNER

Ready April 16.

A breezy satire on married life and its little troubles. Full of crisp dialogue and the keen humor characteristic of this writer.

Frontispiece by Will Grefé. $1.50.

The Pursuit

By FRANK SAVILE

Ready June 1.

The pursuit of a kidnapped heir to American millions, with romantic Tangier for the background.

Illustrated by Herman Pfeifer. $1.50.

The Red Symbol

By JOHN IRONSIDE

Ready April 16.

A swiftly moving tale of love, mystery and adventure in which an American newspaper man becomes entangled with a Russian secret society.

Illustrated by F. C. Yohn. $1.50.

An American Baby Abroad

By Mrs. CHARLES N. CREWDSON

Ready May 7.

An entertaining account of the adventures of a Kentucky beauty traveling abroad, in which an American baby plays Cupid.

Illustrated by R. F. Outcault and Modest Stein. $1.50.

The Illustrious Prince

By E. PHILLIPS OPPENHEIM

Ready May 7.

A tale of mystery and international intrigue without a dull moment in its pages. The situations are tense, and the climaxes are unusual.

Illustrated by Will Foster. $1.50.

LITTLE, BROWN & CO., Publishers, 34 Beacon Street, Boston

THE BAKER & TAYLOR COMPANY'S BOOKS

FICTION

The Top of the Morning

By *JULIET WILBOR TOMPKINS*, author of "DR. ELLEN" and "OPEN HOUSE."

The most readable book of the season; sparkling, high-spirited, full of vitality, vivacity and charm.

With frontispiece in color. 12mo. $1.50.

Gwenda

By *MABEL BARNES-GRUNDY*

Author of "DIMBIE AND I," "HILARY ON HER OWN," "HAZEL OF HEATHERLAND."

A love-story told to a confidante; in fact, the story of two loves—one that failed, followed by one that succeeded. A book that flashes with wit, and touches the feelings with the tenderest sentiment, and holds the reader's interest with the grip of a vital story. 12mo, 350 pages. With frontispiece. $1.50.

The Owls of St. Ursula's

By *JANE BREWSTER REID*

The pranks and escapades of four girls at boarding school; told with a spirit and dash—a vivid realization of the time, the place, and the persons, and a delicate sentiment—that suggests an autobiographic basis for the narrative. A book that girls will rave over. 12mo, 250 pages. With four illustrations. $1.25.

TRAVEL

Camp and Camino in Lower California

By *ARTHUR WALBRIDGE NORTH*, author of "THE MOTHER OF CALIFORNIA."

A book of adventure and exploration in a region which lies almost unknown at our very doors. Lower California has a long and fascinating history. Upon this region, Mr. North is probably the greatest living authority, and the book contains not only fascinating records of adventure, but no less valuable records of scientific exploration and description. 8vo, about 350 pages. With 32 illustrations. $3.00 net; postage 18c.

A Guide to Great Cities—Northwestern Europe

FOR YOUNG TRAVELLERS AND OTHERS

By *ESTHER SINGLETON*

Such a book as will place young and untravelled visitors in touch with the ten famous cities it describes.

12mo, 350 pages. 12 illustrations. $1.25 net; postage 12c.

BIOGRAPHY

A Guide to American Biography—"Men of Mind"

FOR YOUNG PEOPLE AND BEGINNERS

By *BURTON E. STEVENSON*

An inspiring record of the achievements of men of mind in American history.

12mo, 388 pages. 16 illustrations. $1.25 net; postage 12c.

A Stepson of Fortune

By *HENRY MURRAY*

An autobiography, refreshing for its candor, vigor of expression, range of experience, and portraits of noted men.

8vo, about 350 pages. Frontispiece. $2.75 net; postage 12c.

VERSE

In Praise of Gardens

Compiled by *TEMPLE SCOTT*, author of "THE PLEASURE OF READING" and Editor of "SWIFT."

The first collection in English of garden poems, covering in its range the whole field of English poetry.

16mo, about 250 pages. With frontispiece, decorations, etc. $1.25 net; postage 8c.

Odes on the Generations of Man

By *HARTLEY BURR ALEXANDER*

Author of "POETRY AND THE INDIVIDUAL," "THE MID-EARTH LIFE," ETC.

"This is poetry."—*The Living Age.* $1.00 net; postage 6c.

LITERATURE

Women as Letter Writers

Edited by *ADA M. INGPEN*

The best letters written in English by women from the 16th century to our own day.

Foolscap 8vo, cloth, gilt top. With 9 portraits. $1.25 net; postage 10c.

TWO NOTABLE RECENT BOOKS

Retrospections of an Active Life

By *JOHN BIGELOW*

The most important contribution of 1909 to American Biography and History.

3 vols., 8vo. 40 portraits. $12.00 net; carriage extra.

History of Architecture Vol. II.

By *RUSSELL STURGIS*

"No history of architecture has ever before appeared in the English language that can even be compared to it."—*Architectural Record.* Quarto. 400 illustrations. Per vol., $5.00 net; carriage extra.

Portrait catalogue in preparation. Sent on request.

THE BAKER & TAYLOR COMPANY, 33 East 17th St., New York

The Nation

VOL. XC.—NO. 2337. THURSDAY, APRIL 14, 1910 PRICE TEN CENTS.

The Macmillan Spring Fiction

Gertrude Atherton's *new novel* **Tower of Ivory**

"Brilliantly written"; "Mrs. Atherton's ripest work"; "Of extraordinary clearness and power"; "A remarkable and noteworthy book"; are among the terms in which the leading critics praise this notably powerful work. *Cloth, $1.50*

Winston Churchill's *new novel* **A Modern Chronicle**

"The book is literature, and it will be so adjudged by readers of widely differing literary tastes and ethical inclinations. . . . There is no doubt of its bigness and brilliance."
—Chicago Record-Herald.

"Readers have longed for years to have just such a story from Mr. Churchill's pen. . . . it will naturally make an appeal wider than any of his other creations. Honora is one of the most vital women in modern fiction."—*Philadelphia Record.*
Illustrated, cloth, $1.50

F. Marion Crawford's *last unpublished fiction*
The Undesirable Governess

This is totally different from most of the novels on which his reputation rests; it is brimming over with delightfully humorous touches, all of which show the keen observation underlying his intimate knowledge of English country house life. That this should be his last novel makes it seem almost like the particularly laughable story one sometimes produces to mask the regret of parting. *Illustrated, cloth, $1.50*

Robert Herrick's *new novel* **A Life for a Life**

By the author of "The Common Lot," "Together," "The Master of the Inn," etc., and it is said will further justify the rank assigned him of being the most authoritative analyst of social conditions now writing American fiction. *Ready early in May*

Mrs. Voynich's **An Interrupted Friendship**

Is a study of penetrating, unforgetable distinctness whether she is writing of an idyllic French chateau, of the depths of South American forests or of that bitter, distorted, disappointed devotee of liberty, the "Gadfly," whom Rene brings back to sting Italy into revolution. *Cloth, $1.50*

READY THIS DAY

Mary S. Watts's *notable new novel* **Nathan Burke**

Is a big canvas, broadly interesting, thorough as Thackeray, shot through and through with the most deliciously natural human touches that keep the reader smiling at their genuineness. It is a book to be passed on to a friend with an assurance of pleasure to come. *Cloth, $1.50*

LONGMANS, GREEN, & CO.'S LIST

ANCIENT and MODERN IMPERIALISM By the Earl of Cromer. Crown 8vo. 90c. *net*

". . . full of stimulus for every intelligent mind . . . packed with wise saws and modern instances . . . the tone of the book is truly statesmanlike."
—*The Daily Mail.*

GATHORNE-HARDY. First Earl of Cranbrook : A Memoir, with Extracts from His Diary and Correspondence. Edited by the Hon. ALFRED E. GATHORNE-HARDY. With portraits and other illustrations. 2 vols. 8vo. $7.00 *net.*

"Mr. Gathorne-Hardy's simple and admirable biography. . . . To students of modern politics, both volumes contain much interesting material set forth in a simple and lucid manner." —*Daily Chronicle.*

TALES OF BENGAL. By S. B. BANERJEA. Edited by Francis Henry Skrine, Indian Civil Service (Retired). Crown 8vo. $1.00 *net*

A series of sketches illustrating home life in our most advanced Indian province. They cast a flood of light on the complex Bengali character, and display the practical results of British Administration as it affects the masses. The editor's task has been mainly one of adaptation for Western readers; but the author tells his own story in language which is simple and redolent of the soil. Mr. Banerjea opens entirely new ground, and his volume will give Englishmen some insight into the causes of the existing unrest.

A CENTURY OF EMPIRE, 1801-1900 By the Right Hon. Sir HERBERT MAXWELL, Bart. With photogravure portrait. In 3 vols. 8vo. Vol. I. From 1801 to 1832. $4.00 *net.* [*Ready*]. Vol. II. From 1833 to 1868. $4.00 *net.* [*Ready*].

***The work will be completed in Three Volumes, which will be issued at intervals of about six months.

PSYCHOLOGY OF POLITICS AND HISTORY. By the Rev. J. A. DEWE, M.A. Honours Graduate of History, School of Honours, Victoria University, Manchester, England; recent Professor of History in Military College of St. Thomas, St. Paul, U.S.; Professor of History in Ottawa University, Ottawa, Canada. Crown 8vo. $1.75 *net.*

Columbia Studies in History, Economics and Public Law. *New Volume* (*Vol. XXXVI, No. 1*). **RECONSTRUCTION IN TEXAS.** By CHARLES WILLIAM RAMSDELL, Ph.D., sometime University Fellow in Columbia University, Instructor in History, University of Texas Fellow, and Corresponding Secretary and Treasurer Texas State Historical Association. 8vo. 324 pages, price $2.50, paper covers; or bound in cloth, $3.00.

LONGMANS, GREEN, & CO., 4th Avenue & 30th St., New York

LETTERS AND MEMORIALS OF

Wendell Phillips Garrison

Editor of the Nation (1865-1906)

In one volume, crown 8vo, 300 pages, with photogravure portrait. Price $1.50 net, postpaid.

During the forty-one years in which he edited the *Nation,* with a thoroughness, ability, and conscientious devotion unsurpassed in the records of American journalism, Mr. Garrison was an indefatigable correspondent, never employing an amanuensis, but writing tens of thousands of letters with his own hand to his contributors, who embraced practically all the leading American scholars and critics of the period. From a dozen groups of these, which have been kindly loaned by the recipients, a sufficient number of selections has been made to illustrate the relations between Mr. Garrison and his great corps of contributors, the frankness and tact which he exercised towards them, and the wide range of his interests, tastes and sympathies. The volume also contains a brief sketch of his life, a dozen of his best poems, and several of his characteristic editorials, reviews and essays, besides a fine photogravure portrait. It likewise preserves the notable letter of appreciation addressed to Mr. Garrison by more than two hundred contributors to the *Nation* on the completion of his fortieth year of service, and his acknowledgment thereof.

HOUGHTON MIFFLIN COMPANY. Boston and New York

The Nation.

NEW YORK, THURSDAY, APRIL 14, 1910.

The Week.

Attorney-General Wickersham's speech at Chicago last Saturday night might easily have been made a source of great strength to the President. It is an able statement of the most meritorious points in the work of the Administration, and it appeals, in several directions, to sentiments and purposes which have, at the present time, a powerful hold upon the nation. But all these elements of strength in the speech were made of doubtful efficacy by the repetition, in an exceptionally offensive form, of that wholly unnecessary blunder which has been the prime source of the President's troubles. Up to the time when Mr. Taft began his speech-making tour last summer with a laudation of Aldrich and followed this up with a blanket endorsement of the Payne-Aldrich tariff in his famous speech at Winona, he had lost but little, in any part of the country, of the hold upon public support with which he began his Administration. It was an almost fatuous error to insist on tying himself up irrevocably with the work of the Cannon-Aldrich machine; and now, Mr. Wickersham with one hand strikes a manful blow for the Administration on the side of its general performance, and at the same time with the other hand binds it closer than ever to the obnoxious tariff by branding all Republican opponents of it as traitors.

Mr. Wickersham closed his speech with a reassertion of the Administration's position on the Trust question. It is most sincerely to be hoped that errors in the treatment of party divisions will not be permitted to stand in the way of cordial support of the Administration in its efforts to deal with this great problem. Along this line there was greatest reason to hope for substantial progress from a man of Mr. Taft's training and temper, and in Mr. Wickersham he has had a legal co-worker of very high ability. The note sounded both by him and by Mr. Taft has been a clear one, and it has been consistently adhered to. The task which they have undertaken in this one field is sufficient to engage their highest powers, and to tax the resources of their energy and resolution. Instead of demanding unanimous and mechanical assent upon every feature of the party's programme and the party's record, let them realize the supreme importance of accomplishing a solid achievement in the curbing of the great monopolies. If they can but place this to their credit, they will have no need to worry. As Mr. Wickersham truly says, this issue "overshadows in importance all others in the minds of the people."

The baiting of Uncle Joe has become a bi-weekly recreation for the Democratic-insurgent alliance in the House, and, on the whole, it must be sadly admitted that the Speaker is far from being the "game sport" popular tradition has made him out. He lost his temper in the course of the memorable fight on the Rules Committee and vented his spite against the men who had downed him, in a speech that was tart, even for Mr. Cannon. Last Monday, after the House had refused to vote him an automobile for traversing Washington's vast official distances, he lost his temper again and scolded the Democrats and harangued the faithful, quite in the old-time cart-tail tradition. Does the Speaker really think that the great man whom he is so proud of resembling would act like that in the same circumstances? Has he forgotten Lincoln's capacity for receiving punishment with a smile? Anger in a politician is at best an unseemly thing. It is particularly to be avoided when it gets to a man's head and makes him talk sheer nonsense. "I want to notify you," said the Speaker Monday, "that unless during this and the next session of Congress—this Congress expires on March 4—the Republicans on this side that do not approve of the personality of their Speaker have the courage to join with a solid minority, I will remain Speaker until March 4 next." Unless? Hasn't the "unless" already hit Mr. Cannon, and hit him hard?

We would not conceal our disappointment at the findings of the military court which investigated the shooting-up of Brownsville by members of the Twenty-fifth Infantry. As our readers are aware, we have always felt that the facts pointed the other way, and that Senator Foraker's statement of the case was unanswerable. Now, the verdict of a court composed of officers of unusual ability and standing finds that the shots did come from the barracks, recommends the reënlistment of only fourteen men, and severely censures the officers of the offending battalion as well as the men. As there are veterans like Brig.-Gen. A. S. Daggett, himself commander of the Twenty-fifth before Santiago, who are still strongly convinced of the men's innocence, we can only think that this *causc célèbre* must go down to history as little settled in the popular mind as is the Schley-Sampson controversy. Certainly, the wonder will never end that 275 colored men could enter into a magnificent conspiracy of silence and maintain it all these years after their discharge from the service. So far as the officers are concerned, the *Nation* pointed out at the time that, if the battalion was guilty, they were far more culpable than the men—but they were allowed to go scot free. And nothing that the present or any other tribunal may say will convince us that the wholesale discharge of innocent and guilty alike was defensible in morals or in law.

Gov. Crothers has refused assent to the Digges disfranchising bills passed in the closing days of the Maryland Legislature. With the disfranchising project, taken in itself, he is in entire sympathy; but he has yielded to the force of the arguments against the revolutionary scheme of accomplishing this object of excluding negroes from registration, in direct defiance of the Fifteenth Amendment, upon the wild expectation, real or pretended, that the Supreme Court would hold this part of the Constitution invalid, at least so far as Maryland State elections are concerned. The proposed disfranchising amendment to the State Constitution—which is likewise in contravention of the Fifteenth Amendment—will go to the people, with Gov. Crothers's approval, for ratification or rejection in November, 1911; but the Governor announces his purpose of obtaining, in some way, by means of a test case, a Supreme Court

decision as to its validity before it goes into effect. If the thing was to be tried at all, this is a decent and orderly way to go about it; and when it is all over, the gentlemen who can't sleep o'nights on account of the danger to white supremacy in Maryland will have the pleasant consciousness of having done what they could to ease their minds, without causing any very great amount of mischief.

Nothing we have ever heard of equals the selfishness and insatiability of the pension hog—not even the similar traits of the tariff hog. When Mr. Roosevelt let down the bars and pensioned every veteran who had served ninety days whether in a fort in Boston or a camp in Indiana or at a recruiting station in New York or elsewhere, one naturally supposed that the utmost limits of this raiding of the Treasury and rewarding of worthy and unworthy had been reached. Now, however, Congress is actually pensioning the criminally unworthy. On Tuesday of last week an effort was made in the House Committee on Military Affairs to pass forty-three bills to relieve as many deserters from their ineligibility for pensions. Fortunately this scheme was defeated. But both the House and Senate Committees have recommended for a pension one John Gray, who, prior to his desertion, had served one thousand miles from the seat of war and never enlisted until December 20, 1864, when most of the fighting was over. As the minority of the House Committee rightly declared:

> Desertion is among the most serious offences known to military law, and is rarely entitled to the consideration of Congress. This is not one of the cases that should be condoned. If it is done, Congress will, in effect, say that the faithless soldier shall enjoy the same substantial reward that is given to the man who served loyally and was discharged with honor. It is an insult to the latter to force him into the society of the former.

The United States Steel Corporation has not been deterred by the abuse showered upon it by Mr. Gompers and other union leaders from taking an advanced and admirable position in regard to Sunday labor. Of their own accord, the officers of the Corporation have curtailed the hours of weekly labor at all steel works, rolling mills, shops, quarries, and docks controlled by them. As they have no less than 200,000 men on their payroll, the far-reaching character of this change is as obvious as the fact that it means a large increase in the annual net cost of operation. In Allegheny County alone 13,000 men are said to work seven days in the week, year in year out. Most of this Sunday labor has heretofore been defended as unavoidable, and it is not yet to be wholly done away with. But there is so much just criticism of corporations in their various capacities that it seems to us only proper to draw especial attention to an unselfish and enlightened act like this one of President Gary and his subordinates.

In reference to the rehearing of the Standard Oil and Tobacco cases, there are two points upon which there will be general agreement. The first is that the extraordinary importance of the expected decision fully justifies the endeavor to have a full court participate in making it; the second, that it is most earnestly to be hoped that the delay in making the decision will be the shortest possible. At the same time, it is not out of place to remark that while the pendency of any decision of such character and scope must be to some degree a disturbing factor in financial affairs, there is no sign of any such paralysis of capital as the sensitive imagination always manifest in some quarters seems to picture. A good deal of activity has recently been displayed in capitalist circles, even when the decision was expected momentarily; and both industry and trade will keep fairly alive, we fancy, during the new period of suspense caused by the Supreme Court's resolve for a rehearing.

More than ever does the noble, embattled Interstate Commerce Commission deserve the thanks of an injured people. Its members have won their niches in the Hall of Fame by reducing the cost of upper berths in the Pullman cars. Throughout the country, the men who prefer lower berths will rise up and call the Commissioners blessed. Henceforth it will be possible to board a train at any hour of the night and learn from the porter that there is a lower berth left, instead of hearing the familiar story of there being but one upper to rent. The men who say that they prefer the upper berth to a lower because of the better ventilation need no longer offer this or any other excuse. While we hardly go so far as some of our contemporaries in believing that this decision will induce railways having no bridges or tunnels on their lines to build taller cars with upper and uppermost berths, we at least feel confident that some reform of the upper berth will now come to pass—that is, if the company is enlightened and believes in meeting what will be a great popular demand.

Just what the supremacy of the air means nobody yet quite knows; but assuming that it means something, and is therefore of transcendent importance, Germany has been pointing with pride to her winged superiority over France. In that country there is a sharp division of opinion. The commander-in-chief of the French army believes, for instance, that not everything that goes up in the air deserves serious consideration from a military point of view. He has little faith in dirigible balloons, of which Germany has many, and is an ardent advocate of the aeroplane, in regard to which France is ahead of her rival. There is, however, a timid faction in France which insists on being impressed by the superiority of the German air fleet. As representing such opinion, the Paris *Temps* has offered to build for the Government, by popular subscription, a fleet of six air-machines, consisting of two dirigibles, a Wright biplane, two Farman biplanes, and a Blériot monoplane. The offer has been accepted by Presidential decree, and one of the most staid and conservative of Parisian newspapers has secured a valuable amount of advertising which the most enterprising American "yellow" might envy.

The spectacle of a well-to-do traveller in search of health being taken from a steamer because he is suffering from tuberculosis, and sent to Ellis Island, is enough to make everybody blush with shame. Not because he is rich, and not because the action is in any sense illegal, for the law forbids the landing of one suffering from this disease; but because it puts the United States in the ghastly position of denying to a seeker after health the benefits of certain regions particularly salutary in such cases. What would become of the pulmonary invalids of Europe should Switzerland

deny to the thousands who seek them the benefits of its altitudes? What an outcry would go up all over the world if Switzerland should say, "We have enough consumptives of our own," or if the Black Forest should be reserved only for Germans, with signs reading "Americans, English, and other nationalities not admitted." In the case under consideration, the possession of means does make a difference, in that the patient can prove that he will not be a burden to the community. These matters may present difficulties, but some way out must be found. It is barbarous to deny to any one fighting for life the boon of a sojourn in Arizona, New Mexico, or Colorado.

It is in the main both gratifying and reassuring to note the manner in which the recent adjustment of our tariff dispute with Canada is received in that country. A certain element, bound to be heard from on such occasions, is, of course, inclined to crow over our "backing down" and accepting minimum rates on "only 3 per cent." of our exports to the Dominion; while another faction, made up of Sir Wilfrid Laurier's critics, taunt him with having made concessions to President Taft. Most Canadians, however, appear to be inclined to answer in the affirmative Sir Wilfrid's pertinent question, "Is not the peace which we have with our neighbors worth all the nuts and prunes in creation?" though, at the same time, these supporters of the Canadian Premier point to the fact that he has kept his vow never again to go to Washington with his hat in his hand as he did, only to be rebuffed, in 1897. But one of the most significant utterances we have read comes from the Ottawa correspondent of the Boston *Evening Transcript*, who says:

> The right men are to the fore in both countries. They have already agreed to negotiate further. Now is the time to bring into evidence all factors of American opinion that favor reciprocity. A deep, new impression might be made before Mr. Roosevelt's reappearance shall temporarily distract public attention.

This, it is only fair to add, was written before even the first returns had been received from Rome.

We have been asked by the National Progresista Party of the Philippines to approve their demand for an "express and solemn declaration that it is the unswerving purpose and intention of the people of the United States to vote the Filipino people their independence" and "that American sovereignty over these islands is temporary." This we do most gladly, since we have been urging nothing else from the beginning of the Philippine experiment. The Progresista party is the oldest and best organized one in the Philippines, dating back to 1901. It claims to have aided the Government in pacifying the islands and establishing civil government therein. Like all the other Filipinos, its members long for national independence, and see a particular menace in the attitude of a majority of the Americans in the Philippines, who maintain that perpetual American sovereignty is the only means to induce the investment of American as well as foreign capital. Hence their appeal in national convention on February 6 for a definite pledge by the United States Government. They ought to have it, and at this session of Congress. We are aware that the Administration at Washington is anxious to get capital into the Philippines. By throwing open the sale of the friars' lands in violation of the spirit of the organic law of the islands, it hopes to lure in the Trusts. The Governor-General, Mr. Forbes, has been doing his best to get American capital to flow in. All office-holders there are like Mr. Taft, certain that it would be very unwise to set a specific date for our withdrawal. But what the Progresista party asks is a positive binding national promise that we shall some day grant independence. This is the least that we can do for the Filipinos, and if we do not do it our own country will have deep cause to regret its inaction.

The new régime in Belgium has happily lost little time in taking up the question of reform in the Congo. Tuesday morning King Albert is reported to have given his sanction to the plans elaborated by the Minister of Colonies for throwing open a wide area in the Congo to free trade within the next few months. In name, of course, free trade prevails in the former Free State, in accordance with treaties under which it was founded. Actually, a great part of the country has been parcelled out into concessions which, as far as foreign commerce is concerned, have been so many closed preserves. The new regulations, therefore, must mean the abolition of the virtual monopoly established by the concessionary companies and a curtailing of the practically sovereign powers they have exercised. More important than the question of free trade to most of those who have been working for the demolition of the inhuman Leopoldian system in the Congo, is the provision that taxes are not only to be reduced, but are to be paid in money and not in forced labor. The labor tax has been one of the chief iniquities visited upon the unhappy natives. In conjunction with the seizure of the native lands by the Government, the labor tax has been responsible for the rapid depopulation of the country. A necessary complement of the tax was the systematic warfare which the authorities carried on against the natives in order to extort the maximum quantity of rubber. If forced labor is done away with, the restitution of the native lands is bound to follow. Then it must be only a question how soon the reforms can be extended to the whole of the Congo.

Whatever measures it may adopt in combating the agitation for electoral reform, the Prussian Government only emphasizes the indefensible stupidity of its own position. After resorting to the mailed fist to suppress suffrage demonstrations and only bringing on riot in all the principal towns, the Prussian authorities have decided for conciliation; as a result, 120,000 Social Democratic and Radical voters of Berlin paraded last Sunday and in huge open-air meetings voiced the people's demand for electoral reform. Never has German discipline shown to such splendid advantage. The paraders moved to the various starting points in companies of a hundred under command of a centurion distinguished by a red band about his arm. The huge assemblage gathered about fourteen duly numbered speakers' platforms in Treptow Park. Speaking began at the sound of the bugle and ceased at the same signal. A bugle sound accompanied the clamorous acceptance of the drafted resolutions, and the crowds dispersed as peaceably as they had assembled. Is it for fear of a *sansculotte* régime that the Prussian Government refuses to give the masses a real vote? If ever a people was fit to rule itself, it is this loyal, splendidly-disciplined German people.

MR. TAFT'S DIFFICULTIES.

For President Taft's position, both in relation to his own party and in relation to the country, it would be difficult to find a parallel. From his cancelling of his engagement to speak at Indianapolis, after the Indiana Republican platform had ignored him and the Payne-Aldrich tariff, it is evident that he himself sees the peculiarity of the situation; and it becomes accordingly pertinent to consider the qualities of temper, character, and habit that have brought things to this pass.

That Mr. Taft's proverbial—or, as some might now say, notorious—good-nature has been to him one prolific source of these perplexities and disappointments, is quite certain. But this is by no means a complete explanation. It is doubtless largely owing to his good-nature that Mr. Taft accepts innumerable invitations to college commencements, class reunions, miscellaneous dinners, and what not; and doubtless, too, this constant travelling up and down the land, this dining and speech-making to no special purpose, must have done a great deal to weaken that grip on the main elements of the national situation which is a chief requisite of the Presidency. But though good-nature may account for the enormous mileage of his travels, and for the number of his speeches, it does not account for the character of the speeches. To a large extent his troubles have been due to a habit of ignoring the difference between the utterances of the President of the United States and those of William H. Taft as an individual. Whatever his heart inclines him to say on the tariff, on the navy, on Speaker Cannon, on Senator Aldrich, that he says to his eighty million fellow-citizens. It was not necessary for him to shoulder the responsibility of the Payne-Aldrich tariff; it was not necessary for him to give Aldrich a certificate of high character; it was not necessary for him to range himself alongside Speaker Cannon. The Presidency of the United States is a heavy load to carry; but one burden that it does not impose is that of defending the acts of Congress or the actions of the leaders of Congress. The country at large felt very strongly that the tariff act was a betrayal of the people's confidence; Mr. Taft might possibly feel that it was well enough, but no more than that, and if he had only had the homely wisdom to leave well enough alone, he would have been spared nearly all his troubles and mortifications.

Mr. Taft's conspicuous championship of the tariff act and his laudation of Aldrich are, we are fully prepared to believe, in great part the result of qualities in themselves admirable. His habit of judicial impartiality, and that simple frankness which is so engaging a trait of his personality, both had their share in the matter. He put himself in Aldrich's place. "Could the master of the Senate," we imagine Mr. Taft saying to himself, "the recognized repository of the high-protection interests, be expected to yield everything? Of course not. From the Aldrich standpoint, what more could I have expected than I got? It is true that I wanted the tariff revised downward in a substantial way; but, on the other hand, the platform never mentioned the word 'downward' at all. Now there *was* a downward reduction, and in some points a considerable one; Aldrich isn't half as black as he is painted. Indeed, from his standpoint, he acted very handsomely, and I am bound to tell the people that he is a good American patriot." But this capacity to see both sides of a question is not the prime quality either of a great executive officer or of an effective political leader. The desire to give the devil his due, and even a little more than his due, may be a very amiable thing in a private citizen, and it has its proper place even in the White House; but to make it anything like a dominant note in the Presidential programme is to invite disaster. The President may, without incurring criticism, refrain from passing judgment on questions that are in controversy; he cannot with impunity pass judgment that reflects neither any clear position of his own nor any marked aspect of public sentiment. Mr. Taft had stood, before and during the campaign, for a genuine revision of the tariff. If what he got was, to his mind, a satisfactory compromise, he may have been justified in accepting it without complaint, but it was deplorably bad judgment to make himself its sponsor before the nation.

Nearly three-fourths of Mr. Taft's term is still before him. There are great services which he is capable of rendering. His honesty and patriotism are universally recognized; his abilities in many directions are undoubted. He might, by making one simple change in his Presidential practice, go far toward recovering the ground he has lost. It is not incumbent on him to travel about the country making political speeches. That is no part of the tradition of the Presidency; the only President who ever indulged such a propensity in a conspicuous way was poor Andrew Johnson. Mr. Roosevelt's speech-making belonged to an entirely different category; he was preaching Rooseveltism all the time—a thing difficult to define, indeed, but, as every one will recognize, a thing as different as possible from the ordinary making of political speeches. Usually, Presidents, when they have found time to talk to their fellow-citizens in various parts of the country, have made remarks of a broad and general character, such as are gratefully received by all. If they have departed from this innocuous programme, it was for the sake of attracting the special attention of the country to some object singled out as of cardinal importance from the President's standpoint. The every-day work of explaining particular bills, defending particular individuals, or upholding particular details of the party's record, it is far better—as well as safer—to leave to the lesser figures of public life.

A shrewd adviser or two, with just those qualities of alertness and intensity that President Taft lacks, would seem to be an urgent necessity; men who would tell him that some things which are quite right in themselves are not worth while for the President of the United States, and that other things are immensely worth while and cannot be neglected. It does not seem that this sort of help, necessary to almost any President and peculiarly necessary to Mr. Taft, is at his disposal. If he is to recover his hold on the influence which, as President, he certainly hoped to wield, he must abandon the naïveté which has thus far characterized his conduct. His qualities of judicial fairness and of untrammelled communicativeness must be offset by enough worldly caution and enough political skill to give character to his dealings with political difficulties. With ample recourse to his undoubted privilege of keeping silent when he chooses, and with the aid of some long-headed practical adviser in those difficulties which he cannot

afford to leave unsettled, the remaining three years of his Presidency might tell a tale very different from that of the first.

DEMOCRATIC AND ARISTOCRATIC SPORT.

For the average American, nothing is more abhorrent than the idea of caste which runs through the entire structure of English society, unless it be the ready and complacent acceptance by the individual Englishman of the system, even at the points where it implies and enforces his own patent inferiority. The term "gentleman," which every male American wears with aggressiveness as a chip on his shoulder, is, in England, nowhere so much a shibboleth as among those who would be the first to repel the imputation of gentility on their part. An American travelling in a continental railway carriage entered into conversation with a well-dressed and apparently well-bred Englishman. It appeared that the latter had at home a young son, concerning whose education and future career he displayed a natural solicitude. "I suppose," remarked the American, "that you will soon be sending your boy to one of your big schools, Harrow, Eton, or Rugby." Whereupon the Englishman turned with a look of some surprise, but without the slightest trace of embarrassment, and replied: "Oh, no, those are schools for the sons of gentlemen."

But the presence or absence of caste distinctions in a society is not the sole factor in determining whether that society is democratic or undemocratic. Where a man's position is clearly defined, he may mingle freely with those both above and below him in the social scale; but where official equality has levelled all distinctions, the deep-seated human instinct of exclusiveness is brought into full play as the sole means by which the few may assert their superiority, and secure their position against the manifold aspirations of the many. The result is that in America the eager desire for that superior range of associations which is the symbol of success, has produced a species of undemocratic snobbishness which only a democratic country could compass. An American took for a season or two a country seat in England, and joined the local hunt club. As it was the custom for each of the members in turn to entertain the hunt at a breakfast after the weekly meet, the American signified his wish of sharing in this hospitality. "Very well," replied the English friend to whom he had confided his ambition, "but you'll have to drop your American snobbishness. The Duke of ——, whose place is here, belongs to the hunt, and, since you are an American, of course you'll be glad to have him. But remember that you can't have him alone. You've got to have the butcher, the baker, and the candlestickmaker, too, whether you want them or not. For they are all members of the hunt, on precisely the same terms as His Grace, though he puts up the bulk of the money for the expenses."

There is no better illustration of the radical difference between English and American society, and of the more essential democracy of the former, than is provided by the organization of sport in the two countries. Every great national pastime affords a common meeting-ground for all classes of Englishmen. Noblemen, gentry, and yokels come together on numberless village greens each week for cricket, and, as players, there is no distinction between the highest and lowest. It has often been said that it was this admission of all classes into the sports and pastimes patronized by gentlemen, that, more than anything else, discounted the effects of the European revolutionary movement by the time it reached England. How was the "villain" to take arms against his local "overlord," for whom he defended the wicket each week? The vague, restless demand for equality was satisfied progressively as it arose, and before it had time to grow articulate with resentment. Sport has proved a cement for English society, and has created a sentiment of solidarity.

Would sport be found to have served the same purpose in this country, if the mutterings and rumblings of revolution were heard in the distance? Has a democratic conception and practice of sport tended to draw all classes together, to create an *esprit de corps* between, let us say, the steelworkers and the steel magnates, and thus to render the society of Homestead homogeneous? On the contrary, we believe that sport is tending rather to force the various sections of American society still further asunder. It is true that as a country in which sport is widely popular, America is second only to England. But here there are sports and sports—sports for the workers and sports for the leisure classes, sports for the fashionable and sports for the unfashionable. With few exceptions, these categories are kept separate and distinct. For the most part, the out-of-door pastimes of the leisure classes have been imported from England, and have been organized on a basis which precludes participation in them by any but the very rich. Thus pursuits like fox hunting, which, if not precisely popular in their origin, have, nevertheless, become strongly tinctured with the democratic spirit abroad, where any farm boy astride a plough horse is free to follow the hounds, have here been transformed into the most potent instrument of what the French call *snobisme*. This American sport is the fine flower and epitome of American exclusiveness, too sacred to be shared—except through the pages of the pictorial newspaper, the Sunday morning after a meet.

An American, whether the field of his activities be business, college, or society, is always fighting for his own hand. It does not occur to him to extend the scope of his recreation, so as to include a greater number of fellow participants. His only associates are those who, possessing the same tastes as himself, have means commensurate with his own for satisfying them. He is not one of a class, but of a group. The Englishman's idea of a class, to which he belongs and to which he assimilates his own personal idea of himself, crystallizes his social consciousness and imposes obligations and responsibilities at the same time that it confers privileges and immunities. An aristocracy may be more successful than a democracy, not in phrasing noble ideals of human brotherhood, but in achieving a good, practical working formula of equality.

AMERICANS AS LINGUISTS.

"English is the coming language," says a writer in the *Popular Science Monthly*. "And it is coming rapidly; for while it is difficult to learn thoroughly, in the matter both of style and pronunciation, it can readily be acquired with sufficient correctness for all commercial and practical purposes." Perhaps it is because we are waiting for the English language to complete its rapid conquest of the globe, that condi-

tions at our universities are such as Prof. William James commented upon in our columns the other day with regard to Harvard. Speaking of the lecture course given at Cambridge by the distinguished French philosopher, Emile Boutroux, Professor James says:

> The Hyde foundation requires all lectures to be in the French tongue, and the first thing that has been disclosed is the appalling rarity of ability to understand spoken French, even in a centre of learning like Cambridge. M. Boutroux's auditors this year should preëminently have been our students of philosophy; but, victims of the deplorable manner in which they have been taught foreign languages, hardly half a dozen of them have shown their faces. Few even of our instructors follow a French lecture easily. . . . Their number proved so small that the bulk of the audience consisted of world's people from Boston and elsewhere.

The world's people, we take it, were mostly young women from the Back Bay district who had learned to prattle French at the knees of their governesses and benefited by extensive practice on foreign soil.

Professor James, like the writer in the *Popular Science Monthly*, is here pleading for a "practical" knowledge of the languages, as distinguished, we suppose, from a merely theoretical knowledge. For whether it is a question of selling cotton goods to a merchant in Buenos Ayres or listening intelligently to a lecture on Pragmatism in French, we are most of us in the habit of regarding the spoken word as more valuable—for what else can "practical" mean?—than the written or printed word. But it is not fair to dismiss the Harvard Ph.D. by speaking of the deplorable way in which he has been taught his foreign languages. If there must be Ph.D.'s—a necessity which has been seriously questioned—and if the Ph.D. finds it essential to learn a foreign language or two, it is still the fact that what he needs primarily is a reading knowledge of foreign languages, rather than a speaking knowledge or a listening knowledge. After all, the presence of a French or German lecturer among us is an exceptional phenomenon and is usually the result, as in the case of the Hyde lectureship and all other systems of exchange professorships, of interests other than academic. There are people who read French or German with almost native ease, yet speak these languages with the greatest difficulty. Such a condition does not argue that your Ph.D. is unequipped for following up the latest records of foreign research in his department. It simply means that he has not had the advantages, and desirable advantages they are, of learning the language in childhood or of sojourning for a considerable time in foreign parts.

The separation between theoretical and practical acquaintance with a language is, in one sense, much narrower than is generally supposed. Theoretical knowledge may easily turn into practical knowledge by dint of a few months' practice with the spoken tongue. The man who reads French easily needs only to be set down in the Latin Quarter for a little while, in order to speak it "practically" and a bit more than that. Necessity will attune his ear to the exotic accent and bring his own large, but reluctant, vocabulary into readier call. If his talk is inclined to be bookish, we may yet be sure that it will jar less on the cultivated native ear than the broken-backed sentences of the average man who speaks from "practical" knowledge. After all, it requires no great linguistic attainments to go through a foreign country and order the kind of meals one likes. A pageful of phrases in Baedeker will serve the purpose. And there is always the one real international language that has found universal acceptance—gesture. You have only to recall how easily the Italian immigrant in New York can find his way to an address on Staten Island or in the Bronx, to see how comparatively easy it must be for a Pittsburgh millionaire to find his way to the Forum or Montmartre.

And in that fact is seen the essential weakness of the claim put forward for all the international languages that the revolving years see come and go. For commercial and practical purposes one does not really need very extensive lingual facility. After a man has acquired the technical training which qualifies him to sell cotton goods on an extensive scale, anywhere, he should find no great difficulty in qualifying himself to sell cotton goods in Argentina. As a matter of fact, we venture the guess that every great trade has its *lingua franca*, which passes current over entire continents, and which meets all the purposes of Esperanto, Ido, Ilo, and their kin. There is, to be sure, a higher form of salesmanship which consists in entering into social intimacy with a man and taking him to the theatre before you sell him a large bill of goods. But that again presupposes Esperanto established in the theatre, in the newspapers, in literature, in every other field of social intercourse.

This, however, is somewhat beside the point. It means comparatively little for our national culture that our people should know how to speak the foreign tongues. It means very much that a reading knowledge of the foreign languages should spread among us. After all, what most of us want from the foreign peoples is their recorded literature and science. We can get what we want of Europe's sights and foods by following Mr. Cook, or by pointing, like the millionaire in the story, to the bill-of-fare.

GLAMOUR AND PICTURE PRICES.

By a curious coincidence a splendid Correggio, probably the finest example of this rare master that can ever come into the market, is now going begging in New York at about the price paid for the dearest of the Corots in the Yerkes sale. It would not be difficult to find fifty Corots as fine as the Fisherman; in fact, it has no appreciable superiority over its companion-piece, which at the same sale fell some twenty-eight thousand dollars short of the new Corot record. A finer example than either barely passed $20,000. These facts show that auction prices, so far from serving as standards, are determined chiefly by non-economic and sentimental reasons. Mere rarity counts only in part. It would explain the astounding price of $129,000 paid for Turner's bewitching Rockets and Blue-Lights. An example of this peculiar charm may never again come into the market. For the $137,000 paid for a magnificent portrait by Frans Hals rarity is an insufficient explanation. With a little diligence it would not be difficult to obtain as fine a Hals for half the money. Note also that a number of pictures of very doubtful authenticity were bought at sensational figures, often by dealers, and you will see that Mr. Kirby was all the while knocking down something other than the stock in hand.

What he was knocking down was, of course, the notoriety of the Yerkes name and the legend of the collection itself.

The pictures appeared quite incidentally in the transaction, being not really the object, but merely the occasion, of the competition. Just as the sturdy Joneses when they move up in the world become the Grandison-Joneses, so these simple Corots and Halses and Turners are now become the Yerkes-Corots, the Yerkes-Halses, the Yerkes-Turners. In many instances the dealers have paid double the normal value of certain pictures because they know that this hyphen can be resold for a substantial profit. Art is proverbially long, but unhyphenized pictures rarely fetch the long prices. Whether the Yerkes legend was worth what was paid for it last week is an idle inquiry. At least it was efficacious and psychologically well compounded. Its ingredients were hints of Oriental splendor and domestic infelicity, titanic industrial operations in two continents just shaving at times the criminal code, a magnificent gift of the legendary collections to New York promptly annulled by circumstances, and above all the glamour of ruthless force and unbounded money-spending. It is an edifying thought for those who rightly appreciate the importance of money that the legend of opulence is no idle elaboration of the imagination, but may posthumously be converted into new cash values.

But note that the unction of the legend can be communicated only to prepared minds. In this respect it borders on religion, which assumes a predisposition in the devotee. In other words, even notorious wealth can impose value only upon objects which already have the consecration of admitted expensiveness. We are used to thinking of Corots in five figures. As costly objects they are classic, like yachts or racing stables. Had not a recent sensational sale accustomed us to thinking of Frans Hals in six figures, it is doubtful if that dour old lady with the rheumatic hands would have made her amazing record.

Who ever heard of Baldassare Peruzzi? He merely built some of the most beautiful palaces in the world—we hate to think how the Yerkes house would strike him—and, after his greater contemporaries, Raphael and Michelangelo, he was the best painter in Rome. Well, a big and unwieldy picture by him somehow drifted into the Yerkes collection, and see how posterity rebuked that eager amateur for presuming to adventure beyond our common knowledge: this stately picture fetched $600, which, being interpreted, is about thirty dollars a square foot, the frame thrown in. One of the fine products of the culmination of modern painting could not even find a museum imaginative enough to harbor it. But nobody ever called this artist "Papa Baldassare," nor did he ever explain how he felt when rosy dawn began to appear. In general, the late Mr. Yerkes was both adventuresome and conventional in his tastes. Where he was incorrigibly original his estate has paid the penalty. He acquired some thirty Eastern rugs of the rarest and most beautiful type, and simply because the town does not yet know how expensive rugs ought to be, these fell far short of their value, and presumably were a losing investment. Let us hope that their owner drew his current profits in enjoyment of these gorgeously lovely fabrics.

It would be foolish to moralize too narrowly the somewhat grotesque phenomena presented by this kind of an auction. More reasonably one may recall that the matter lies apart from taste and a little apart from reason itself. Like many other illogical spectacles, it may be enjoyed even where it defies analysis. What is important to note is, psychologically, that we are in the realm of sheer glamour, and, practically, that the prices have very little to do either with the intrinsic or the normal market value of pictures. We have to do, in short, with an enthusiasm quite isolated, and potent chiefly because of the relative ignorance of those whom it affects. The Yerkes sale is a sign of expansion in our art market—indubitably so—but not of advance in knowledge and in taste. Lest we forget the odd romanticism of it all, let us recall the apology made by certain advanced critics when the Impressionist painters were blamed for effacing all definite objects in landscape. These painters, said the critics, are not painting objects at all, but the atmosphere intervening between the objects and the eye. Similarly, there are occasions when not pictures are sold, but the intervening glamour and notoriety. Among such occasions, the Yerkes sale should long be memorable.

JEAN MOREAS.

PARIS, April 2.

A whole poetic revival comes to an end in France with the death of Jean Moréas. It had many phases—those of his own intense intellectual life. For nine years after 1882 he was the exponent most followed of the new "symbolist" poetry. In 1891, with a poem of which only the title, "Passionate Pilgrim," was taken from Shakespeare, he proclaimed the death of Symbolism and swung his followers round to verse older than Ronsard, old as the troubadours, a blend of Latin with Gaul, forming a "Romanic" school—*école romane*. Then, with the years, he came to be a pure classic, wrote his "Stanzas" (1899), and put the "Iphigeneia" of Euripides into the French of Racine.

This may be not as interesting as French politics, but it is more wonderful, more picturesque, all the more so as Jean Moréas was a Greek of Athens and was naturalized a Frenchman only a little before his death. And then foreign critics still go on speaking of Symbolism as if it were an existing school of French poetry, whereas this Athenian leader of French youth effectually assassinated it years ago; and he helped more than any other to put in its place something more French (and more Greek), which has survived until now.

The real name of Jean Moréas was Papadiamantopoulos, an heroic name of Byron's Greece fighting for independence. One of his family burned the Turkish ships at Canaris, another was killed at Missolonghi. His father was one of the young independent Greeks whom their German king Otho had educated in his native Munich. The education brought him to be a magistrate of the supreme court of the new kingdom; but he decided that his son's upbringing should be French. Jean's governess had connections with the classic French stage, so that he was initiated from childhood into the great traditions of the language. This, of course, could never give him that wilful power over a language which belongs only to those whose baby efforts at self-expression have won them an unconscious mastery of it as a part of their very life. Such supple, living language is the outcome of the child's struggle, while reason is forming, with parents and nursemaids and teachers and playmates; and no foreigner can ever acquire it. But Moréas had next best: the clear and easy use of polite language from childhood, with such a knowledge of book French through all the ages as astonished Gaston Paris himself. And poetry is written for books, and so he was fit to lead the Latin Quarter lambs into new poetic pastures.

He came to study law in Paris after the war; but young minds were seething, and he frequented the lectures

which his father hoped would form him, far less than the literary cafés. He knew the Hydropathes, where Jean Richepin was beginning a tempestuous career, ending in noble verse. When he was twenty-six he took his own flight in an ephemeral review which declared itself representative of the new Latin Quarter. His revolutionary manifestoes and extraordinary verses did as much as anything else to organize the revolt of the young poets against the weakly correct Parnassians who survived, and against the Realists who were trying to bring Zola's theories into art.

Dark, heavily moustached, with the air of a palikar of Greek independence, he had all that was needed to make him a leader. It was a sight to see him march into his café with his young troop of poets at his heels, wheeling short before the glass, lost in contemplation before his figure, while the others stood mute, and then twirling his moustache with an emphatic "I am beautiful!" as he sat solemnly down to his little rum-and-water. Few understood the recondite joke which had its salt from Plato's teaching that a leader must be beautiful as well as good—*kalokagathos*.

It was half play-actoring and altogether in earnest. Of course, Verlaine took up with the band, and Moréas addressed him in the memorable lines of which the easiest are:

> Divin Tityre, âme légère comm' troupe
> De satyreaux ballant par bonds!

Anatole France, who was then more critic than writer, remarked that the poetry of the new symbolists was not always clear. The essential was that each idea should be expressed by an image, its symbol. This was playing at poetry; but when Moréas brought out his "Passionate Pilgrim," he was at once recognized as a poet who had come to stay in the French language and literature. The language would have been archaic even to Ronsard; and Frenchmen learned quantities of words which had slipped from use, and yet had not lost their strength. Symbolism was now dead, and the cry was how to pick up and weave together again the scattered strands of old and true French verse. Maurice Barrès next remarked that Moréas was a "grammarian poet."

This a foreigner might well be; but Jean Moréas had nourished his youth and manhood on the choicest works of his native Greece. He was like the young student of the Ionian Islands, whom an Oxford professor assured that no modern Greek was a competent Greek scholar. "That, sir, is worth debating; and, that the discussion may be more satisfactory, let us carry it on in classic Greek." And, to the discomfiture of the Englishman, whose Greek was mainly in dictionaries and other philology, the young man wrote out on the cabin table of the boat bearing them to Athens his plea for the living use as against texts annotated by Northern barbarians. It was Greek that Thucydides might easily have understood. So Jean Moréas brought a living Euripides into France. It was under rehearsal at the Comédie-Française when he died.

In his later work he was all that is correct and clear and fluid in classic French poetry. This allowed his thought to pierce through fantasies of language; and, really, he has written some of the recent poetry which may live longest. Doubtless, it is the volume of "Stances" in which his thought, best adapted to such short compass, will be sought. Here is his comment on Pindar's answer to the enduring question, "What is man's day of life? A shadow's dream!"

> Ne dites pas: La vie est un joyeux festin.
> Ou c'est d'un esprit sot, ou c'est d'une âme basse.
> Surtout ne dites point: Elle est malheur sans fin.
> C'est d'un mauvais courage et qui trop tôt se lasse.
>
> Riez, comme au printemps s'agitent les rameaux,
> Pleurez comme la bise ou le flot sur la grève,
> Goûtez tous les plaisirs et souffrez tous les maux,
> Et dites: C'est beaucoup et c'est l'ombre d'un rêve.

S. D.

THE AMERICAN ORIENTAL SOCIETY.

PHILADELPHIA, April 5.

The 122d meeting of the American Oriental Society, which took place in Baltimore at the Johns Hopkins University March 31-April 2, was well attended, although some of the most active members, like the past president, Professor Lanman, and the recording secretary, Professor Jackson, were prevented from coming, and another past president, Prof. E. W. Hopkins, could be present at only one of the sessions. Particularly noticeable was the large proportion of young scholars, whose presence and participation promise well for the continued scientific activity of the Society. At the business meeting preceding the reading of papers Prof. Maurice Bloomfield of the Johns Hopkins University was elected president for the ensuing year. Profs. Paul Haupt, Henry Hyvernat, and C. C. Torrey were elected vice-presidents. The other officers and directors were reëlected, except that the retiring president, Dr. W. Hayes Ward of New York takes the place on the board made vacant by the advancement of Professor Bloomfield to the presidency.

On the conclusion of the business meeting Dr. Ward delivered his presidential address, choosing as his subject "Oriental Sources of Greek Mythology." The address was based on Dr. Ward's elaborate studies of the seal cylinders of Western Asia, which were recently brought to fruition by his two publications, the catalogue of the 323 cylinders in J. Pierpont Morgan's valuable collection and the comprehensive work on seal cylinders just issued by the Carnegie Institution. Dr. Ward showed how, chiefly through the mediation of the Hittites of central and northern Asia Minor, conceptions connected with some of the chief deities—notably Aphrodite—among the Greeks had been modified. Symbols of these deities, such as the dove of Aphrodite, the thunderbolt of Zeus, and even the trident of Poseidon, were traced back to their Oriental sources. Dr. Ward is also inclined to ascribe a considerable share of Hittite influence on Babylonia and Assyria, and would trace to this source the phase of the Babylonian-Assyrian Ishtar associated with sexual love.

The reading of papers began on Friday morning and was continued on Friday afternoon and Saturday morning. In all, forty-seven papers were presented, though a number of these were read by title only, owing to the absence of their authors. While the preponderance of papers this year was in the field of Semitic philology, the Indo-Iranian group was also well represented. Professor Bloomfield gave some specimens of his forthcoming work on "Repetitions in the Rig-Veda," which he has prepared as one of the supplements to his great "Vedic Concordance." The total number of repeated stanzas and single-verse lines in the Rig-Veda ranges into the thousands. Through these, a valuable aid to the interpretation of lines and to the relative chronology of the hymns is furnished. Thus, in passages where the more obvious translation of a certain term has been assumed to be "poor," the specification in one of the repeated lines shows that the correct rendering is "poet," which incidentally illustrated that in ancient India, as in our own days, there was a natural association between poverty and the professional writer of poetry. George W. Brown, a pupil of Professor Bloomfield's, presented an exhaustive study of the common Sanskrit *prāna* and *apāna*, which resulted in fixing the meaning as thoracic and abdominal breath, respectively, instead of in-breathing and out-breathing or *vice versa*, respectively. The distinction rested upon a primitive view that the air in the lungs and upper part of the body was of a different character and of a different vital quality from that below the diaphragm.

In the Semitic section, Professor Haupt of the Johns Hopkins University was represented by several papers. One of these dealt with the so-called "Priestly Blessing," of the Priestly Code (Numbers vi, 24-26), which he declared to be of late origin—exilic or post-exilic. Instead of the rendering "may he lift up his countenance unto

thee," he proposed by a slight textual change to read "may he raise his eyes to thee"; and comparing the phrase "to raise the eyes" to a well-known Babylonian counterpart *nishit eni*, Professor Haupt showed that in both languages, the idea conveyed was that of being attracted to some one, and therefore, to be regarded with favor. Professor Lyon of Harvard University analyzed in detail the objections urged by Prof. Joseph Kohler of the University of Berlin against the analysis of the famous Hammurabi code, given by Professor Lyon six years ago. His arguments were convincing that the compiler (or compilers) of this code was swayed by logical considerations in the arrangement of the 282 statutes. The first five statutes constituted an introduction on Evidence and Decision, followed by two broad divisions into (1) Property (§§ 6-126), and Person (§§ 127-282). The former division falls into three subdivisions: (a) Personal, (b) Real Estate, and (c) Trade and Business, and each of these into a varying number of further subdivisions; the latter likewise into three larger subdivisions (a) Family; (b) Injuries; (c) Laborers and Labor, each with further subdivisions.

Prof. J. A. Montgomery of the University of Pennsylvania gave an account of three interesting charms or mortuary inscriptions on gold foil, now in the Metropolitan Museum of New York. The inscriptions in a Judæo-Aramaic dialect come from the Hauran district in Syria. Professor Montgomery read a translation of one of the longest, consisting of thirty-two lines, which implores protection against evil demons. A Persian name, Shapur, gives a clue to the date, which may be of the third century of this era. The name of Jahweh is written with the three letters J H W as in the Aramaic Papyri recently found in Elephantine. Professor Jastrow of the University of Pennsylvania gave a synopsis of his paper on the great astrological series of Babylonia-Assyria. He showed that it was a composite production, consisting of parts and sections which range from the Sargon period down to the Cassites, *i. e.*, from *c.* 2700 B. C. to 1700 B. C. This series, known from the opening words as "When Anu and Enlil," was originally written at least in part in Sumerian. In its "Babylonian" or Semitic garb it remained the official handbook of the priests for astrological omens down through the Assyrian period.

The session of Friday afternoon was devoted to papers on the Historical Study of Religions. In a short but incisive paper, Prof. L. C. Barret of Dartmouth College criticised the school of comparative mythologists who would see everywhere in "Myths about Dragon Fights" the struggle of a god who creates light against a demon who darkens the moon. His criticism was particularly directed against Ernst Strecke's recent monograph, "Drachenkämpfe." Professor Barret urged that one must distinguish among the various classes of such tales, and that in some cases the stories were not even myths, but tales of heroes who did not represent degraded gods.

A paper of present interest was that by Prof. George A. Barton of Byrn Mawr College on the new "Deluge" fragment published a few weeks ago by Professor Hilprecht. After deprecating the sensational manner in which the discovery of this little fragment was exploited, being heralded as "ushering in a new period in the history of religion," Professor Barton showed by careful analysis of the script that it belonged to the Cassite period, which would make it 400 or 500 years later than the period assigned to it by Professor Hilprecht, and therefore not nearly as old as the tablet in Mr. Morgan's library. In the discussion that followed, Professors Haupt and A. T. Clay concurred with Professor Barton's view.

The Society adjourned Saturday noon to meet in Cambridge March 16-18, 1911.

J.

NEWS FOR BIBLIOPHILES.

The Catalogue of the Edwin B. Holden collection is now in the hands of collectors, and is a remarkable volume. Nearly eight thousand lots are described, and the sale will continue for twelve days, two sessions a day, afternoon and evening, beginning April 21, at the rooms of the American Art Galleries, in New York. The descriptive adjectives "scarce," "very scarce," and "exceedingly scarce," are used with judgment and discretion. We wish, however, that the catalogue had been supplied with head lines and page numbers. It has, for the most part, been prepared by Robert Fridenberg, than whom no man has a better knowledge of American prints. It will be of interest to print collectors to note here that Mr. Fridenberg, after a partnership of twenty-four years in the firm of J. O. Wright & Co., has now individually taken the print stock and will hereafter carry on the print business in his own name.

Mr. Holden's collection of engraved portraits of Washington surpasses in value and interest the Mitchell and Bement-Carson collections, which were dispersed in Philadelphia a few years ago, and comprises upwards of eleven hundred lots. The late William S. Baker's book on the engraved portraits of Washington was the authoritative list until the publication by the Grolier Club of Charles Henry Hart's catalogue in 1904. Mr. Fridenberg refers to both the Baker and the Hart numbers. Most of the rarities are included in the collection.

The collection of engraved portraits of Franklin is said to be the finest ever brought together, and comprises about five hundred lots. The rare mezzotints and etchings, as well as several fine specimens printed in colors, are included.

The third section of the Catalogue, the Maps and Views of New York city, is certain to be of especial interest at the present time. Among the older views there is a unique early engraving in the style of the Allard view, and done probably about 1664, before the surrender of New York to the English. Canot's South East View, and the same artist's South West View; the Carwitham View of Fort George; Robert Havell's two views from the East River, and from the North River; a set of Bourne's Views, India proofs; and a complete set of Jones, Newman, and Ewbank's "Pictorial Directory of New York," are other items. The collection of the works of early American engravers, such as Asher B. Durand (119 lots), David Edwin (188 lots), W. S. Leney, J. B. Longacre, Peter Maverick, and Paul Revere (including his famous plate of the Boston Massacre) is very extensive, and the series of engraved views of American scenes fills many pages of the catalogue. The engravings by artists other than American number upwards of two thousand and include many specimens of Rembrandt, Dürer, Raphael Morghen, William Marshall, Faithorne, Bartolozzi, and Hellar, and the most extensive collection ever brought together of the works of Gaillard.

Among the autographs are a document signed by Peter Stuyvesant, the last Dutch Governor of New York, and several documents signed by early English Governors of the colony; a valuable letter written by Benedict Arnold, from Robinson's House, August 16, 1780; a survey and several letters of Washington; three autograph letters of Benjamin Franklin; fine letters of Hancock, Huntington, McKean, and other signers of the Declaration of Independence; letters of Gates, Greene, Benjamin Lincoln, Heath, Patrick Henry, Alexander Hamilton, and other Revolutionary generals and statesmen; letters of Lamb, Dickens, Prescott, Emerson, Whittier, Lowell, Longfellow, and other English and American writers; and an important manuscript account of the Siege of Yorktown in 1781, by an unknown French engineer, accompanied by a beautifully drawn manuscript map of the siege.

The books included in the sale are few in number and mostly Americana, but very rare items are included, such as the original Boston edition of the "Impartial History of the War in America" (1781), with the very rare third volume, and the full set of portraits engraved by Norman; the first edition of Ethan Allen's "Narrative" of his Captivity (Philadelphia, Bell, 1779); the first edition of the trial of Major André (1780); the first edition of the "Short Narrative of the Horrid Massacre in Boston" (1770); the first edition of John Clarke's "Impartial and Authentic Narrative of the Battle fought on Bunker's Hill" (1775); the first edition of Dickenson's famous "Letters from a Farmer in Pennsylvania" (Philadelphia, 1768); Simcoe's "Journal of the Operations of the Queen's Rangers" (printed for the author, 1784); and a very long series of tracts on the Stamp Act and Revolution.

On April 18, the Anderson Auction Company will sell the library of the late Howard L. Osgood of Rochester, N. Y. The library is mainly Americana, relating to New York, Connecticut, and Pennsylvania. The rarest book is, without doubt, David Cusick's "Sketches of the Ancient History of the Six Nations," printed at Tuscarora Village (now Lewiston, Niagara County, New York), in 1828. This is the second edition, of which,

according to the title-page, seven thousand copies were printed. The first edition was printed in 1825, but no copy of either has ever before appeared in the auction market.

On April 19 and 20 the Merwin-Clayton Sales Company will sell a collection of Americana, including a number of pamphlets relating to the Stamp Act and the Revolution; several desirable Connecticut titles; books on California and the West; a series of Eulogies on Washington, etc.

Correspondence.

OFFICIAL SCIENCE UNDER THE TAFT ADMINISTRATION.

To the Editor of The Nation:

Sir: At the recent Minnesota State Conservation Convention, the secretary of the interior of the United States, in an address the effect of which could only be to discourage conservation of natural resources, is reported to have stated that not more than four-tenths of one per cent. of the total coal supply of the world has yet been mined, and that the supply is sufficient to last 7,600 years. It would be interesting to know upon whose computations these figures are based, since the estimates of the experts of the United States Geological Survey have placed the proportion of the fuel now unmined at from 40 to 70 per cent. of the total original supply, and have predicted complete exhaustion of the mines in from 107 to 120 years. Cabinet officials have not heretofore indulged in such grotesquely inaccurate statements upon scientific subjects, and the effect of the speech upon the public mind and conscience is likely to be so much the more disastrous.

Quite recently, too, as a consequence of the Pinchot-Ballinger inquiry, we have learned what, but for this investigation would probably not have become generally known, namely, that one of the great scientific bureaus of the government has under protest rendered an expert report contrary to the facts and by order of the same cabinet officer. If not the first instance of the prostitution of a government scientific bureau to private interests, it is at least the first outside the land office that has become a matter of common knowledge.

Almost at the same moment the chief of the United States Weather Bureau issued a supposed scientific report upon "The Influence of Forests on Climate and on Floods," a report which purports to give the results of a special investigation. This report is so contrary to the accumulated knowledge of the past, and, it might be added, to fundamental common sense as well, as to be little less than ludicrous. To illustrate, one of the final conclusions in the report is: "The run-off of our rivers is not materially affected by any other factor than the precipitation." The effect of this report upon science will, of course, be negligible; for the report itself carries its own refutation to the thoughtful reader. It is because the paper appears just as it is needed by private interests to defeat legislation for a much needed forest reserve, and has, further, been made a Congressional document, and been mailed under government franking privilege in almost unlimited numbers to all parts of the country, that the event acquires significance. The interesting question at the moment relates to the "men higher up."

Under all these circumstances, the following statement by Senator La Follette, who, perhaps, as well as any one, is familiar with statistics upon the cost of the necessities of life, will be read with interest:

The data of the Bureau of Statistics have been adopted by the President in his Lincoln Day attempt to show that the Payne-Aldrich tariff is revision downward. This should please the statisticians of the bureau; for when their figures showed that it was a revision upward, Mr. Taft, in his Winona speech, rejected them and adopted a batch of figures which, so far as authority is concerned, might have accidentally blown in from the corridor, but now, the wind-blown tables are justified by those more legitimate ones emanating from the Bureau of Statistics.

Has the time not arrived for the scientific bodies of the country, and particularly for the National Academy of Science, to enter a protest against the invasion by political influence of the freedom and independence of bureaus of scientific inquiry?

Wm. H. Hobbs.

University of Michigan, April 4.

HOLBERG AND "THE RECRUITING OFFICER."

To the Editor of The Nation:

Sir: In the *Nation* of March 24 Professor Beach mentions the similarity between the dénouement of Holberg's "Erasmus Montanus" and a scene in Farquhar's "Recruiting Officer." It is interesting to note that this play is the only English comedy to which Holberg explicitly refers. To a line in "Peder Paars" (Bk. iv, canto iii, line 38), in which he is describing the tricks of a recruiting officer, he appends the following note:

To soldiers who want to learn the tricks of recruiting, I recommend an English comedy called "The Recruiting Soldier" (*sic*).

This definite reference to "The Recruiting Officer" has led many Scandinavian writers on Holberg to agree with Professor Beach in assuming that the lieutenant's trick in "Erasmus Montanus" was consciously borrowed from Farquhar's play. Olaf Skavlan was, I believe, the first to assert this borrowing in his "Holberg som Komedieforfatter" (1872; p. 196). His statement has been repeated by nearly all subsequent writers on Holberg. This generally recognized similarity is interesting chiefly because it is one of the very few definite traces we have of the influence which Holberg's two years in England exerted upon him, although that influence was, I believe, much greater and more fundamental than has hitherto been supposed.

Professor Beach's characterization of Holberg's mock heroic poem, "Peder Paars," as an "obvious son of Gulliver," is a mistake. "Peder Paars," as a matter of fact, was written in 1719, at least seven years before Holberg could have read "Gulliver." The one work of Holberg which has sometimes been regarded as an imitation of "Gulliver" is his "Nicolai Klimii iter subterraneum.

Harvard University, April 5.

THE ORIGINAL PERFORMANCES OF "THE RIVALS."

To the Editor of The Nation:

Sir: In his recent admirable "Sheridan, from New and Original Material," Mr. Walter Sichel says of "The Rivals" (Vol. I, p. 484): "After two performances it was withdrawn, in ten days repaired, and then acted with pronounced and prolonged success." In thus asserting that "The Rivals" was performed twice before it was withdrawn for revision, Mr. Sichel repeats a common error. Percy Fitzgerald, in "The Lives of the Sheridans" (1886, p. 118), says: "The play, first produced on January 17th, 1775, was performed again on the 18th, and then 'withdrawn.'" Lloyd C. Sanders, in his "Life of Richard Brinsley Sheridan" (1891, p. 26), says: "After a second trial, the play was judiciously withdrawn." The assertion is repeated, likewise, by Brander Matthews, G. G. Sigmond, G. A. Aitken, and others. Even John Genest, "Some Account of the English Stage" (1832, Vol. V, p. 459), records a performance of "The Rivals" for both January 17 and 18.

Yet the most casual reading of the newspaper accounts of the original performances of the play shows beyond any doubt that "The Rivals" was produced only once (January 17) before it was withdrawn. A few quotations will be sufficient:

The comedy of "The Rivals," at Covent Garden, is withdrawn for the present, to undergo some severe prunings, trimmings, and patchings, before its second performance. (The *Morning Post*, January 19, 1775).

Notice is given to the effect that the play will be performed "for the second time," on Saturday next, with alterations. (The *Gazetteer*, January 24, 1775).

At the second representation of the new comedy of "The Rivals," it was received with the warmest bursts of approbation (The *British Chronicle*, January 27-30, 1775).

Half a dozen other quotations, equally explicit, might be given.

How, then, has the error of two performances gained such general acceptance among students of Sheridan? Professor Nettleton, who alone has called attention to it, says ("The Major Dramas of Sheridan," p. lxvi):

Probably the best explanation of the mistake is furnished by the following extract, which has seemingly never attracted attention, from the *Town and Country Magazine*, January, 1775. In the course of a critique upon "The Rivals" occurs this sentence: "After a pretty warm contest towards the end of the last act, it was suffered to be given out for the ensuing night." To this, however, is appended the following significant foot-note: "Mr. Sheridan withdrew it after the first night's representation to make some alterations, as we suppose, similar to those here pointed out."

I wish to call attention to a more likely source of the mistake, a playbill of the Covent Garden Theatre actually announcing a second performance of the play on January 18. A facsimile of this playbill is given by Fitzgerald at the end of "The Lives of the Sheridans":

Perform'd But Once. At the Theatre-Royal, Covent Garden, This present Wednesday, January 18, 1775, Will be presented a New Comedy call'd "The Rivals." . . .

This playbill, doubtless, was printed in advance, for the managers of the theatre did not expect failure on the first night. Sheridan wrote to his father-in-law:

There will be a comedy of mine in re-

hearsal at Covent Garden within a few days . . . He [Mr. Harris, the manager of the theatre], and some of his friends also who have heard it, assure me in the most flattering terms that there is not a doubt of its success.

And after the failure, the *Morning Chronicle* (January 19, 1775) remarked: "The new comedy of 'The Rivals' was, in the Green Room of Covent Garden Theatre, but last week, deemed the *ne plus ultra* of comedy." Moreover, the playbill itself contains evidence that it was printed before the first night's failure. One of the chief criticisms of the first performance was the extraordinary length of the play:

The play itself is a *full hour* longer in the representation than any piece on the stage. This last circumstance is an error of such a nature as shows either great obstinacy in the Author, or excessive ignorance in the managers. (The *Morning Chronicle*, January 20, 1775.)

Yet the playbill, after announcing the performance of "The Rivals," says:

To which, By Particular Desire, will be added, (the thirty-fifth time) The Druids. With the Alterations, the Last New Scene and Additional Performances. . . .

Surely the managers, after discovering that "The Rivals" was too long by "a *full hour*," would not announce for the following night an additional performance. Since, as I have tried to show, the playbill was probably printed in advance, it cannot, in the face of the overwhelming evidence of the many newspaper accounts, have any authority.

Doubtless, as the *Town and Country Magazine* states, the play was "given out for the ensuing night"; the playbills had been printed in advance; subsequently, it seems, the author decided to withdraw the play for revision. It would be interesting to know how the managers of the theatre met the situation.

JOSEPH QUINCY ADAMS, JR.

Ithaca, N. Y., April 6.

SHAKESPEARE'S "MOUNTJOY."

TO THE EDITOR OF THE NATION:

SIR: In your issue of April 7, Mr. R. W. Shannon points out the fact, which Professor Wallace and myself had overlooked, though it is noted in many editions of the play, that "Montjoie," the name given to the herald in Shakespeare's "Henry V," was the designation of an office, in France—that is, was the title of the chief of the heralds. It would be impossible, however, to tell from Holinshed's text alone that the name was not a personal one, and, if Shakespeare knew that it was not—which may have been the case—he must have learned it from some other source. The dialogue between the king and the herald which we find in act iii, scene vi, lines 111 ff., seems (like everything else in the play) to show that Shakespeare, himself, regarded it as a personal name. It runs as follows: Montjoy—"You know me by my habit." King Henry—"Well, then I know thee; what shall I know of thee?" The herald delivers his message, and again King Henry asks: "What is thy name? I know thy quality" (*i. e.*, profession), to which the herald replies: "Montjoy." One might say that Shakespeare here purposely adopted the title as a personal name out of compliment to his French host, Christopher Mountjoy. But apart from the fact that it is not quite certain whether Shakespeare was living with the Montjoys so early as the period in which "Henry V" was composed, it is not necessary to resort to such an explanation in view of the ambiguity in Holinshed. It seems to me, then, as I said in my first communication, that the use of the name in this play is due entirely to its occurrence in Holinshed (the principal source for the historical details of "Henry V"), and has nothing to do with the Christopher Mountjoy with whom, as we now know, Shakespeare was living in the year 1604.

THE FREER MANUSCRIPTS.

TO THE EDITOR OF THE NATION:

SIR: Since the first report was made upon the Greek Manuscripts, which Mr. Charles L. Freer brought from Egypt in 1907 (see the *Nation*, January 2, 1908), a considerable literature has sprung up about them. So many requests for information are received that it seems best to make a brief statement in regard to the plan which has been adopted for their publication.

As soon as the value of the manuscripts was recognized, Mr. Freer expressed the desire to make them available for use in the way which should be deemed most effective. After consultation with both American and foreign scholars it was decided to publish complete facsimiles of two of the manuscripts, those of Deuteronomy and Joshua, and the Gospels; and this work was promptly commenced. An introduction to the facsimile of the Deuteronomy and Joshua has been prepared by Prof. H. A. Sanders, and this facsimile will be ready for distribution within a few months. It will be published in a limited edition, which, through the generosity of Mr. Freer, will be presented by the library of the University of Michigan to the libraries of the principal universities. A study of this manuscript, covering its history so far as known, the palæography, and peculiarities and relations of the text, and including a complete collation, has been prepared by Professor Sanders, and is now in press. This will appear as a part of a volume in the University of Michigan Studies (Humanistic Series), which will be devoted to the Greek manuscripts of the Old Testament in the Freer collection.

AN EARLY BIT OF WEATHER LORE.

TO THE EDITOR OF THE NATION:

SIR: Apropos of the fickle spring, is there any earlier bit of weather lore extant in English than the following proverb, copied by me from a fly-leaf of MS. Lincoln Cathedral Library, C. 5,4, where it had reposed since the mid-fifteenth century?—

Whan the raven cryeth befor the crowe,
Than may the housbonde ere and sowe;
Whan the crowe cryeth befor the raven,
Tha[n] drawë shippis into the havene.

"In Scotland," says the Rev. C. Swainson, "it is believed that if the raven cries first in the morning, it will be a good day; if the rook, the reverse." ("Handbook of Western Folk Lore.") Mr. R. Inwards, in his "Weather Lore," quotes the Scots, saying:

The corbie said unto the craw,
"Johnnie, fling your plaid awa'";
The crow says unto the corbie,
"Johnnie, fling your plaid about ye."

My middle English saying is thus held in reverence by the weather sages of our time, it seems. What scientific dogma of to-day has had so long a life?

HENRY NOBLE MACCRACKEN.

Literature.

A CONTINUATION OF GARDINER'S HISTORY.

The Last Years of the Protectorate, 1656-1658. By C. H. Firth. Vols. I and II. New York: Longmans, Green & Co. $7 net.

Few books have been awaited by the historical public in recent years with livelier expectation than the present work. The late Dr. S. R. Gardiner gave us the history of England from the accession of James I to the middle of the year 1656, in seventeen volumes, so exact, so fair, and so readable that the work will never have to be done over again; so complete, moreover, that it is generally recognized by students of English history that the first half of the seventeenth century, which fifty years ago was one of its least known periods, is to-day almost the most difficult field of all in which to find material for an original monograph or doctoral dissertation. When Dr. Gardiner died, in 1902, it was his wish that Mr. Firth, who had already made a name for himself as his foremost disciple, should carry on the work from the point where he had laid it down; and the notes and material which Dr. Gardiner had collected on the last two years of the Protectorate were placed at Mr. Firth's disposal for that purpose. That eight years have elapsed before the expected continuation appeared is no reproach to Mr. Firth's energy or diligence, as those who have followed his career closely will readily admit. In 1904, on the death of Frederick York-Powell, he was elected Regius Professor of modern history at Oxford, and since that time, he has been busily engaged in organizing and supervising advanced historical study and research at the university, which had hitherto restricted its instruction almost entirely to undergraduates. It is particularly fitting that tribute should be paid to Professor Firth's work in this direction in an American journal, for American students, Rhodes scholars and others, have reaped the benefit of his labors fully as much as Englishmen. And, in addition to all this, Professor Firth has continued to pour forth a lavish stream of minor articles and monographs—mostly in the "Cambridge Modern History," the *English*

Historical Review, and the *Transactions of the Royal Historical Society*, occasionally in the form of introductions to the work of his pupils—constant proofs of the comprehensiveness and depth of his knowledge, and of his generosity in imparting it, welcome harbingers of the final product, of which the first instalment has now arrived.

To say that the book justifies expectations, is, under the circumstances, high praise; in our opinion, it is but fair to go further than that, and to assert that it exceeds them. For the task was beset with unusual difficulties, all of which have been triumphantly surmounted. To have continued the work of Gardiner, in any form, is an achievement; to have continued it, as Professor Firth has done, in such a manner that it would be well-nigh impossible for the most careful student to tell, either from matter or style, where one author leaves off and the other begins, is almost a literary and historical *tour de force*. Over and above these special difficulties inherent in carrying on the work of another, the period with which Professor Firth's book deals presents a number of unusually puzzling problems in itself. Parties were so numerous and passions ran so high in the last years of the Protectorate, that the writings of contemporaries often serve to obscure rather than to illuminate the truth. Though many modern monographs have recently appeared on the continental history of the period, the purely English field (perhaps, in anticipation of this very book), has, during the last decade, been left almost entirely alone by other scholars so that the author has been obliged to rely to an unusual degree on his own researches. In short, he has had a great opportunity, and we doubt if any other living man could have utilized it equally well.

The field covered coincides precisely with the last two years of Oliver Cromwell's life—September, 1656, to September, 1658. The interest of the story is throughout a double one. At home we find the Protector ceaselessly but unsuccessfully attempting to clothe his government with constitutional forms, to disguise the nakedness of military rule, to "do *with* Parliaments," since he could not permanently do without them. Abroad he strives to organize a general coalition of the Protestant states of Europe against both branches of the House of Hapsburg, but is thwarted by the bickerings of the Scandinavian and North German Powers on the one hand, and by the League of the Rhine, engineered by Mazarin, on the other; so that at last his original plans vanish into thin air, and are replaced by the more practical Anglo-French alliance against Spain. Such are the bare bones of the familiar tale which Mr. Firth's volumes have done so much to amplify and illuminate. His book contains nothing of a revolutionary nature in statement of fact, interpretation, or point of view: not a single established verdict of importance is overthrown or even challenged. Much new material has been discovered; still more has been intelligently utilized for the first time; but the net result seems to be to confirm and enlarge, rather than to controvert and dispute, the judgments of earlier laborers in this field. The author's fondness for military and naval history stands out in his descriptions of the campaign in Flanders, and of the capture of Jamaica; one feels, instinctively, that his account of these is in every sense of the word final. The newest parts of the book are the chapters dealing with Henry Cromwell's administration in Ireland, and his father's unsuccessful attempt to mediate in the Northern War between the Scandinavian nations, Poland, Russia, and the Great Elector. In his treatment of the former the author shows his fairness and moderation by steering a middle course between the absurdly exaggerated statements of partisan writers on both sides of this traditionally thorny topic. Although the interests of the native Irish inhabitants were completely disregarded—*more antiquo*—by Henry Cromwell's government, and although it is consequently a gross exaggeration to say "that Ireland never prospered as she prospered under the Protectorate," yet the author clearly shows, on the other hand, that the administration of these years marked an immense advance over anything preceding it, in that it was carried on in the interests of the entire British colony in Ireland, instead of in the interests of one section of it—namely, the latest comers—as had been the case before. As to the Protector's diplomacy in Northeastern Europe, Professor Firth points out with unanswerable force that Cromwell's sturdy determination to advance Protestantism at all costs (he was, indeed, the sole Protestant ruler of his day and generation to make religion the chief motive of his policy) crippled his action and retarded his decisions. The system of alliances among the northern states was so arranged that he could not intervene actively on any side without fighting a co-religionist; and mediation was equally impossible, partly because Catholic Poland, whose interests were everywhere concerned, mistrusted him, partly because of the impracticability of Charles X of Sweden and of the Elector of Brandenburg. On the question of the ultimate results, for England and for Europe, of the Anglo-French alliance against Spain, Mr. Firth is careful not to commit himself. Is it fair, as some historians do, to hold the Lord Protector responsible for the baleful preponderance of France under Louis XIV, inaugurated by the Peace of the Pyrenees, and by the humiliation, through English aid, of Spain? Did Cromwell's hatred of Catholicism and the Hapsburgs blind him to the necessity for the maintenance of the balance of power? More definite verdicts on these interesting questions will perhaps be vouchsafed to us in a later volume. For the present, we can only feel that the author's obvious reluctance to indulge in general statements or sweeping conclusions lends added weight to the few expressions of personal opinion which he has allowed himself hitherto.

Certainly, one has an indefinable feeling that one is treading on absolutely safe ground in perusing these two absorbing volumes. If later research yields any material which will serve to alter the statements and conclusions therein contained, the changes, we are convinced, will be but slight. It is scarcely too much to say that the history of the Protectorate is now known as accurately and completely as the history of any period of equal length in the whole course of England's development, the nineteenth century not excepted. The next instalment of Professor Firth's great work should carry the story on to the Restoration of Charles II in May, 1660.

CURRENT FICTION.

When a Woman Woos. By Charles Marriott. New York: John Lane Co.

If the title of Mr. Marriott's book were not so essential to the meaning of his tale, it would be indeed a pity that he should have chosen a name so redolent of melodrama and molasses for a story of highly exceptional truthfulness, simplicity, and strength. The subject here is the one which Bernard Shaw popularized and vulgarized in his "Man and Superman," namely, the eternal pursuit of the man by the woman in obedience to Nature's behest. In Shaw the theme is developed after the boldest fashion. The woman informs the man that she intends to marry him. The man asserts that he won't let her, and runs away to Spain. The woman follows in an automobile, overtakes him and marries him. In Shaw's text, Nature striving after her ends is not merely self-conscious, but positively vociferous.

Mr. Marriott has brought to the problem a deeper vision and a far higher artistic method. His heroine, Audrey Tregarthan, without having previously speculated on love, without even greatly missing it, finds it altogether natural to place herself soul and body at the disposal of the first man who arouses in her the feeling which only later she discovers to be love. Audrey is not the *femme qui se donne* of the French novelists, since she is not the creature of passion, but of instinct. The man in the case is of a type more com-

mon in life than in fiction. In him the offer of unconditional surrender arouses at first bewilderment, and then awe. If the woman's self-abandon is in reality pursuit, and the man's reluctance to accept is in reality the instinct to escape, the fact is indicated as subtly as it reveals itself in life. Without the strong hint conveyed in the title the average reader might perhaps fail to see the point at all. Once the hint is given, he sees that the point has unmistakably been proven.

In Audrey Tregarthan and her lover Fielding we find a blending of the idyllic and the actual which reminds one strongly of Turgenieff. The Russian's method is suggested, too, in the absolutely simple and straightforward way the story is told. It is free from the tremendous moral crises and stresses which other contemporary novelists who have gone to the same corner of southwestern England for their people and their atmosphere, are so fond of. Without being as elemental or tragic a figure as Thomas Hardy's Tess, Audrey Tregarthan leaves the impression of being fully as real.

The Achievements of Luther Trant. By Edwin Balmer and William MacHarg. Boston: Small, Maynard & Co.

Of late it has grown incumbent on the writer of detective stories to invent not merely a hero and a plot, but a method as well. Luther Trant is a young man who, starting from the very bottom as professor of experimental psychology in a Western college, rises to fame as an expert detector of crime by making use of the many methods for soul-measurement that have been devised from Wundt to Münsterberg. Trant's mode of procedure is, ostensibly, a simple one. The man guilty of crime or having knowledge of crime may repress all outward manifestations of the emotion that accompanies such knowledge; but he cannot hide his emotion from the galvanometer or the swinging-mirror. This method, like the best way of making rabbit pie, requires that the criminal be caught before he is tested. To effect that Luther Trant does not rely on chance, but on the classical methods of deduction as practised since Edgar Allan Poe's time. And as a matter of fact it is on this side that the present collection of stories is strongest. Before Luther Trant gets his electric machines into action, he does some very pretty puzzle-solving. With one or two exceptions these stories are far above the ordinary run of this type of fiction.

Little Aliens. By Myra Kelly. New York: Charles Scribner's Sons.

The pleasure with which one renews friendship with these beguiling "little aliens"—or "little citizens"—is touched with keen regret as one realizes that in this book they come among us for the last time. There are few indeed of our many clever writers of short stories whose characters have become so dear to us as have those of Myra Kelly. It is true that she has not in a high degree the distinctive qualities of the story-teller. When we compare her with such a master of the art as O. Henry, we are sure to feel that the best things in her books are exquisite sketches rather than stories But it is largely through this very simplicity of execution, this manner of one making a careless transcript from life, that she makes her own love for her little group of Yiddish children contagious, until even that grotesque speech of theirs, intrinsically so harsh and repellent, comes to have as distinct a charm as any soft Italian patois. Unfortunately, Miss Kelly has made, in this last book, several attempts to cast her material into more conventional narrative form. In four out of the eight stories the plot turns upon very unlikely coincidences, and in no one of these is the event sufficiently interesting to compensate for the sacrifice of reality. In the other stories, however, especially in "Friends" and "The Magic Cape," the old spontaneous humor and pathos are as appealing as ever.

The Losing Game. By Will Payne. New York: G. W. Dillingham Company.

American finance and American marriages, in high places, have been heavily drawn upon of late by our serious, pragmatic novelists. The present is a story of business and marriage upon a much more sordid plane than that Robert Herrick and David Graham Phillips occupy themselves with. Mr. Payne's book is an intimate study of the technique of bucket-shop operation. His hero is a telegraph operator who attains much easily-gotten wealth through his wire-tapping abilities. The real architect of his fortunes is, however, the girl stenographer who first reveals to him the infinite possibilities of getting rich quickly. She marries him when they are still poor, and is a comfort and guide to him in his first, tottering, dishonest steps upward. As soon as he is a millionaire he forsakes her and marries a blonde woman with social aspirations. The last chapter leaves him as poor as the first chapter finds him. The book offers by no means an unfaithful picture of a very definite phase of the national life and character; only it is hard to escape the feeling that it was written for people with a sneaking admiration for the kind of rascality that it pictures so graphically and so attractively.

Over the Quicksands. By Anna Chapin Ray. Boston: Little, Brown & Co.

As a picture of Quebec from the resident's point of understanding, this book is instructive and charming. The reader is so hospitably enrolled in the old city's inner modern circles as to become an affectionate partisan, despising the tourist and dreading the weather that brings him—and this, even though the reader himself may never have seen Quebec. Such is the coaxing power of a year spent in a set of amiable and disinterested young folk whose life is snow sport in every variety, drinking tea, and eating buttered toast. There is a brave attempt at characterization that only partially succeeds in lifting the actors out of the plane of agents in a plot. Of plot, there is not an excess, but there is an all-pervading mystery which, hovering on the edge of classic tragedy, is solved in so domestic a fashion as to suggest a Greek torso restored by Yankee additions. The interest is kept up by the haggard pallors and arrested circulation of those persons who are involved in the dark enigma, and it is not to be denied that curiosity is amply piqued. But the motive of a brother and sister, ignorant of the relationship, falling in love with each other, needs a very large treatment or none—preferably none. Such a theme must needs be stupendous, offensive, or inadequate. Miss Ray, choosing the second best, makes it inadequate.

THE STATE IN LITTLE.

The Junior Republic: Its History and Ideals. By William R. George, with an introduction by Thomas M. Osborne. New York: D. Appleton & Co. $1.50 net.

So much ephemeral literature, some of it unbalanced and misleading, has grown about the young folks' democracy at Freeville, N. Y., that an official history is most welcome. Mr. George tells his story unaffectedly, and with a fine relish for the human nature involved. His reminiscences make the turbulent growth of this miniature commonwealth vivid and at times thrilling, yet his record is essentially a sober one, giving no effect of special pleading.

The republic rose out of the ashes of a charity. It was born in disillusion. For four years from 1890 Mr. George conducted a summer fresh air camp at Freeville, only to arrive at the bitter conviction that he was doing harm. In disgust he turned upon his wards and told them they must work for the clothes which formerly had been distributed gratis. After the first indignation, the plan worked excellently, even became popular, and resulted in a general improvement in *morale*. The camp became no longer a charity, but a self-supporting community, with Mr. George as its benevolent autocrat. It was again despair that forced the first step in self-government. Petty thieving at the expense of neighboring farmers naturally throve in a community recruited from the slums. Mr. George faithfully ad-

ministered corporeal punishment without effect, until one day he realized that the daily whippings were a valued spectacle for all comers. That day he whipped no more, but turned over the two remaining culprits to the judgment of their fellows. The spectators became a tribunal which sternly voted exemplary punishment. Thus the camp took charge of its own conduct. It had reached the stage of a college senate.

From this to complete democracy was but a step. During a winter of hardship Mr. George and the pioneers planned the future state and learned to work together. Next year the republic stood full-fledged, with legislature, executive, and judiciary, token money, and diversified industries. Here was a miniature world in which, unless a boy worked, neither did he eat. It speedily produced its police and prisons; its lawyers and merchants. Laws grew and multiplied, chiefly from the need of protecting property rights. Parties developed; mobs raged and had to be quelled by the police; once something approaching a lynching was attempted. The political demoralization caused by the voting of newcomers was checked by a probationary requirement of residence—to all intents a naturalization law. Woman agitated for the ballot and eventually won it. Unfair trade by merchants commanding markets beyond the bounds was adjusted by the imposition of a customs duty. In fact, the emergencies of the greater Republic reproduced themselves in the junior republic in a most instructive fashion. There was no play about it. The boy or girl who passed from thriftlessness to vagrancy had to work under surveillance. This part of the story is thoroughly familiar and needs no comment except that Mr. George retells it with admirable clarity and humor.

The world, however, may not know so well the money crisis that befell the Junior Republic. Its fiat money, for which no means of retirement had been provided, glutted the treasury. The surplus became a source of heart-burning and corruption. It was foolishly voted away for needless improvements. Public officials battened on contracts. Wealth and intelligence rallied to meet the situation, but Bryanism was in the air, and the "invaders'"—summer citizens—carried the day for "free tin." The Legislature, bound to that policy, squabbled during its short term, but did next to nothing. Cold weather drove the free-tin populace back to the city, and the republic, left a financial derelict, went into voluntary liquidation. Its affairs were reorganized by the proprietary corporation. It erected safeguards for the suffrage, and by becoming a permanent settlement ended forever the political peril of the summer influx. Since then it has steadily grown in territory, population, and material resources, and its form of organization has been imitated elsewhere.

That the republic affords an extraordinary training in self-reliance there can be no matter of doubt. It welcomes the toughest boys from the city and makes good citizens of many of them. Except for a supreme court made up of adult friends of the Republic, it manages its own affairs, and manages them well. Since certain writers have asserted that the percentage of relapse is very large in ex-citizens we wish that Mr. George had met this point not by a general disclaimer, but statistically.

It is still too early to take definitive account of this extraordinary work. How far men like Mr. George and Mr. Osborne, the president of the corporation, are indispensable to success has not been settled. How far the democratic idea has a virtue to inspire average managers remains to be proved. Mr. George has constantly shown a tact and faith that are of the rarest. That these qualities are communicable one may only hope.

Most writers have emphasized the likenesses between the nation and the Junior Republic. The differences, which are considerable, should also be noted. No citizen owns land; it is supplied by the corporation. This means, first, an enormous subsidy to the Republic, and, next, the elimination of one of the thorniest issues from its politics. Next, the wage scale is uniform in all trades and arbitrarily divided into low, medium, and high. Thus competition is greatly reduced. Such paternalism, even though it be continued by consent of the citizens, makes the little commonwealth an imperfect copy of the economic world without. Similarly, the paid artisans, supported not by the republic, but by the corporation, introduce a special element which has no analogy in the real world. These observations are made not in a deprecatory way, but in the interest of clearness of judgment. As to the admirable spirit and general usefulness of the work, there is no doubt. The reading of this book will go far to reassure those whose faith in the democratic principle is wavering. Such doubters may find reproof and instruction in the numerous cases in which the average sense of boys and girls has issued in essential justice and even high political wisdom.

The Elizabethan People. By Henry Thew Stephenson. New York: Henry Holt & Co. $2 net.

This is a work of popularization which offers in reasonable compass a great deal of information on Elizabethan life, custom, and character. For example, it contains chapters on life in London and in the country, sports and indoor amusements, popular superstitions, baptismal and bridal customs, etc. A good part of the material is taken from modern authorities like Sidney Lee and Hubert Hall, but the author has also used to a considerable extent such sources as Harrison, Stow, and the Elizabethan plays and pamphlets. He has not altogether avoided the chief danger of works of this kind—namely, the exaggeration of what differentiates the life and modes of thought of the particular period from our own. For instance, superstitions about fairies were common in the days of Elizabeth, but surely not "every mother" felt a "thrill of fear" at the birth of her child lest the fairies should carry it off. The book, too, suffers somewhat from the want of historical perspective. The writer was under no obligation to give even a brief history of the different matters of which he treats, as they had already developed before the reign of Elizabeth, but an occasional glance backward, and, perhaps, forward, also, is necessary to set customs, etc., in their right light. As it is, Professor Stephenson describes each thing entirely severed from its historical connections, as if it had existed only in the Elizabethan age. Connected with this defect, no doubt, is his indiscriminate selection of pictures for the illustration of Elizabethan sports and customs, many of those which he reproduces from Strutt and others being really (though this is not indicated) mediæval or modern in their origin. The procedure in question is particularly unfortunate in such a book as the present one, since it is calculated to confuse (in regard to costume and such matters) the class of readers who are most likely to use it, viz., beginners in the study of Elizabethan literature.

The chapter most open to criticism is that on Elizabethan character which begins the book. The "savagery" of the age is over-emphasized and the "dislike of long and continuous mental strain" sounds peculiar, when applied to the generation of Shakespeare and Bacon. The following explanation, moreover, of the great Elizabethan literature which we find in this chapter is, we venture to say, unique:

> Its lasting effect [*i. e.*, of the destruction of the Spanish Armada in 1588] is recognized to-day in the fact that by making continental travel safe, tourists were enabled to bring home precious manuscripts and a knowledge of older and more perfect learning that, when published and conned, directly gave birth to Shakespeare and his followers.

What has become of the long and painful development of the English Renaissance, some of whose fruits were already before the world in the form of the "Shepherd's Calendar," "Tamburlaine," etc.? The new leaven must have worked with the rapidity of our modern patent medicines, for in two years—to mention just a few of its miraculous effects—it had produced the best half of

the "Faerie Queene" (1590)—most of which, it may be remarked, was doubtless already in MS. before 1588—and in five years all the plays of Marlowe that had not appeared, all the extant plays of Greene, and the earliest of Shakespeare's.

Historical Essays. By James Ford Rhodes. New York: The Macmillan Co. $2.25 net.

With two or three exceptions, the papers here collected have already seen the light, either in magazines or in the publications of the American Historical Association and the Massachusetts Historical Society; but they well deserve the wider reading which their publication in the present form will doubtless insure. For one thing, they will appeal strongly to those who, without being vainly curious, nevertheless like to know what a scholar of assured reputation thinks about his science or his art, how he has gone about the composition of his *magnum opus*, and at what rating he estimates his fellow-workers. On all of these matters Mr. Rhodes discourses frankly, and with a felicity and ease of expression that make the volume a contribution to literature.

It is refreshing, for example, in these days of documents, monographs, and research, of monumental books on small subjects, to find an historian of a very modern period waxing enthusiastic over Herodotus, Thucydides, and Tacitus, and urging the study of them; impressing upon would-be historians in the universities the need of thoughtful and generous reading in literature, philosophy, and economics, as well as in their chosen field; and insisting that history which is both patriotic and readable may also be true. Whatever the aim, whether the production of a learned treatise or the composition of an elaborate narrative history, Mr. Rhodes would have the student read, mark, learn, and inwardly digest not only the ancients, but also such modern writers as Gibbon, Macaulay, Gardiner, Carlyle, Lecky, and Lee, together with the great French novelists and critics, especially Sainte-Beuve; and, for the "study of human character," Homer and Shakespeare.

> Natural ability being presupposed, the qualities necessary for a historian are diligence, accuracy, love of truth, impartiality, and thorough digestion of his material by careful selection and long meditating, and the compression of his narrative into the smallest compass consistent with the life of his story. . . . Applying these considerations to the writing of history in America, it would seem that all we have to gain in method, in order that when the genius appears he shall rival the great Greek and the great Roman [Thucydides and Tacitus], is thorough assimilation of materials and rigorous conciseness in relation.

For his contemporaries in one or another part of the historical field, the careers of some of whom he has gracefully sketched from time to time in memorial papers, Mr. Rhodes has always the word of cordial and discriminating appraisal. His tributes to Gardiner, Lecky, Spencer Walpole, Green, Edward L. Pierce, Gen. Jacob D. Cox, and Godkin are models of sympathetic appreciation and balanced judgment; while his sketch of the late Prof. Edward G. Bourne is a worthy estimate of one of the rarest of American historical critics. Of the strictly historical papers, those entitled "Who Burned Columbia?" "The Presidential Office," and "A Review of President Hayes's Administration" are well known and need no further comment here; and the same may be said of the longer studies of Gibbon and Cromwell.

In his presidential address before the American Historical Association, in 1899, Mr. Rhodes said of Tacitus: "We know that we have been in the society of a gentleman who had a high standard of morality and honor. We feel that our guide was a serious student, a solid thinker, and a man of the world; that he expressed his opinions and delivered his judgment with a remarkable freedom from prejudice." If there be added to this the possession of a clear, straightforward, and effective style, the characterization fits admirably Mr. Rhodes himself. One cannot but wish that the history of the United States, which he has told so effectively for the years from 1850 to 1877, may before long be told, in the earlier portion of it, by one who, like him, is "a serious student, a solid thinker, and a man of the world."

The Life of W. J. Fox, Public Teacher and Social Reformer, 1786-1864. By the late Richard Garnett. Concluded by Edward Garnett. New York: John Lane Co. $5 net.

In all the great democratic movements of the first half of the nineteenth century, William Johnson Fox had his share. Beginning life as a bank clerk, he quickly drifted into Unitarianism, and after some preparation for the ministry at Homerton College, London, the theological seminary of the Congregational Church, he became pastor of a Congregational Church at Fareham, near Portsmouth, in 1812. Here his Unitarian opinions caused a split in the congregation; and after a period of trouble and dissension, Fox found himself installed in the pulpit of Parliament Court Chapel, Bishopsgate Street, London. From that time until his death in 1864, Fox was preacher, orator, publicist, editor, and member of Parliament; and in every capacity and at all times he was on the side of religious liberty, popular education, a wide franchise, free trade, women's rights—in a word he was a democratic Liberal of the Radical school. During the long agitation for the repeal of the Corn Laws, he was in request as a platform speaker almost as much as Cobden or Bright, and from the time he entered Parliament as Member for Oldham, in 1847, until he resigned his seat in 1862, he steadily supported every popular cause, and in especial made himself the champion of a really national system of popular education. Nevertheless, in spite of his usefulness to the great reform leaders of the mid-nineteenth century, Fox was rather an advocate of democratic causes than a constructive statesman. No one made more powerful appeals than he from the platform or in the columns of the newspapers; but his work was by its nature transitory and evanescent, and to the present generation Fox as a reformer is barely a name. The history of popular advance in the nineteenth century would, however, be incomplete if the part played in it by him were omitted, and Dr. Garnett's biography is bound to find a place in all libraries of modern English political, economic, and social history, with Graham Wallas's "Life of Francis Place" and Frank Podmore's "Life of Robert Owen," among the older lives and memoirs of Grote, Roebuck, O'Connell, and the other reformers of the period between the French Revolution and the Second Reform Act of 1867.

Dr. Garnett unfortunately did not live to complete his work. He himself had inherited the task from Fox's daughter—Mrs. Bridell Fox—who had collected the necessary letters, notebooks, diaries, and extracts from current literature, but who died without having been able to make use of her materials for a life of her father. The book has been completed by Edward Garnett; but its pages bear traces of haste and carelessness, and of a want of final revision; and the reader cannot but feel a regret that Dr. Garnett was unable to give the last touches to a book which was so well begun.

Besides its value as a biography of one of the prominent figures in the agitation for the repeal of the Corn Laws, Dr. Garnett's Life of Fox will be welcome for the glimpses it gives of James and Harriet Martineau, the Brownings, John Stuart Mill, Richard Cobden, William Charles Macready, and many more of the well-known men and women in the political, literary, and dramatic world of the period. Harriet Martineau's letters to Fox were among the few that escaped destruction when Miss Martineau, in 1857, undertook to secure from future publicity all her correspondence. Fox refused either to return or to destroy the letters he had received from her; and though Miss Martineau showed her displeasure by never again writing to Fox, Dr. Garnett has now been able to do a good service to her mem-

ory by giving from her letters a truer impression of her character than she herself conveyed in her autobiography. The extracts from these letters, as also the letters from the Brownings, which are given in one of the later chapters, are introduced for their own sake rather than for any light they throw on Fox's life or character; and, in fact, the whole of the last section of the book bears plain traces of being a compilation from material at hand, rather than a well-digested completion of a biography.

Notes.

The new volume of stories by Sir Gilbert Parker, announced by the Harpers for spring publication, will not appear until the fall.

Methuen & Co. of London announce a book on "The Fall of Abd-ul-Hamid," by Francis McCullagh. Mr. McCullagh was in Constantinople at the time of the revolution and was able to supplement his own observations by interviews with most of the chief actors.

The Hymn to Zeus of the Kouretes, found on a stone in Crete, is being restored by Prof. Gilbert Murray and Miss Jane Harrison. It has about five stanzas, and, with restoration, is fairly complete. The date is about 300 B. C. It will be published with Professor Murray's notes in the Journal of the British School.

Thomas Hardy's "Jude the Obscure" and "Far From the Madding Crowd" have just been published in Harper's thin paper edition of that novelist's works. The volumes are of pocket size, and though, as was the case with "The Return of the Native," the ink is at times rather pale, that fault is less pronounced, while the printing is otherwise improved, and offers little occasion for criticism.

Prof. William T. Brewster, who has been acting dean of Barnard College since the resignation three years ago of Miss Laura Drake Gill, has been appointed provost of that institution. Prof. G. H. Sabine of Stanford University has been chosen Sage professor of philosophy at Cornell, for one year, in the place of Prof. James E. Creighton. Professor Sabine will edit the *Philosophical Review* while he is at Cornell.

At the gathering in Geneva last July to pay special honor to John Calvin, it was announced that a monument to the Calvinistic Reformation would be seen in that city, and would be as significant as that to the Lutheran Reformation at Worms. More than $40,000 has been pledged to this enterprise (which is to cost about $100,000) in various European countries, but, as yet only about $1,000 has been raised in America. To make a fitting site for the monument it is proposed to cut down a part of the grounds opposite the University of Geneva so as to form a broad walk at a lower level. This walk will have a tesselated pavement and will be reached by a very wide flight of stone steps, at the head of which on either side will be huge boulders, one inscribed with the name of Luther and the other with that of Zwingli. Between this walk and the ancient wall, which here sustains the cathedral wherein Calvin regularly preached, will be a trench. The monument proper will consist of figures carved out of the granite slabs inserted in the wall. The central slab will have the forms of the four men, Farel, Calvin, Beza and Knox, who were the leaders of the movement which resulted in the Reformed, Presbyterian, and Congregational Churches. On either side of this group will come those who as statesmen and rulers promoted and protected the Reformed faith. Subscriptions for this undertaking may be sent to the treasurer, Samuel Macauley Jackson, 700 Park Avenue, New York.

It is difficult to review such a book as "Idealism as a Practical Creed," by Henry Jones (Macmillan). These lectures before the University of Sydney are vigorous. The statement of problems is completely candid. Wordsworth and Browning are effectively cited to confirm the idealistic mood. Moreover, unlike many pleas for idealism, the conditions of rational demonstration are cheerfully accepted. But the rationalist never really gets an idealist where he wants him. At a certain point Dr. Jones, protesting his essential rationalism the while, deftly switches the argument to the temperamental postulate that evil is somehow the necessary medium of the good we must follow. Whereupon, as a kind of benediction, he dismisses his readers with the categorical imperative of Kant. We have no desire to treat lightly what is a stimulating and serious book. Its quality may be illustrated by an extract which may suggest also its shortcomings:

> By uniting nature to man, man to man, and all with God, idealism has involved all that exists, or that man can conceive, in one doubtful destiny. . . . There is no salvation now by partial issues; the question of the rectitude and sanity of the whole order of reality has been raised, and there remain but two (*sic!*) alternatives—hope which cannot despair, or despair which cannot hope.

Of course, one must be a good deal of an idealist to conceive the issue thus sharply, but many people not dwellers in the epicurean sty, nor yet wholly devoid of philosophy, manage to put up with an imperfectly unified world. To admit and accept the ineluctable antinomies of experience is, at least, as respectable as to exalt one's temperamental desire for unity into an ultimate explanation of the cosmos. Even the agnostic position still has something to be said for it, though idealists can naturally tolerate no such cautious and essentially unthrilling attitude toward the hazards of thought and conduct.

The poet laureate's considerable gifts as a prose writer appear to advantage in "The Bridling of Pegasus, Prose Papers on Poetry" (Macmillan). In the essay on "The Essentials of Great Poetry" Sir Alfred Austin combats the present overestimation of lyrism. With Aristotle, he insists that great poetry demands a certain amplitude and universality of theme. The epic is the perfect type of great poetry including within itself all minor lyrical perfections. The essay is acutely reasoned, and should do good. It is supplemented by a paper on "The Feminine Note in English Literature," meaning naturally the undisciplined lyrism that at present claims the entire poetic field. In a parallel between Milton and Dante it is not surprising that the Florentine comes off best. The restraint of merely lyrical qualities, the severe realism of treatment, give the Tuscan work a more sustained imaginative quality. Our author refuses to impute sublimity to the merely vague and rhetorical. Far the most important essay in the volume is that on "Wordsworth and Byron." Quite merciless is the analysis of Matthew Arnold's selections from the two poets. The Byron anthology, according to Sir Alfred, contains a mere fraction of the important verse of the poet, whereas the more famous Wordsworth volume must be reduced by nine-tenths if it is really to offer only the inspired poetry. Byron, it is argued, is the greatest poetic figure of the century. No other man has touched so many pregnant themes with such power and eloquence. Wordsworth's genius is small, specialized, intermittent, and often inadequately expressed. In this contrast, there may be something of the exaggeration of the special pleader, but the argument seems to us in the main quite sound, and eminently salutary. Our judgments have been imposed upon by the flaccid mysticism of Wordsworth, the semi-rational anarchism of Shelley, and the opulent eloquence of Keats. Forgetting certain masculine virtues of poetry, we have seen these singers in a false glamour. In the coming readjustment Shelley and Wordsworth will, we think, lose; Keats much less, for he has at least been valued for his qualities and not for his defects; while Byron will rise to a place hardly lower than that he held in his lifetime.

We can only mention by title the essays, "Dante's Realistic Treatment of the Ideal," "Dante's Poetic Conception of Women," "Poetry and Pessimism," "A Vindication of Tennyson," "On the Relation of Literature to Politics," and "A Conversation with Shakespeare in the Elysian Fields." Where so much weighty, learned, and persuasive criticism is offered, one regrets a lurking conviction that it is, after all, not first class. With a little more wit and amenity, Sir Alfred might take up the good fight where Matthew Arnold left it. What prevents seems to be a fundamental inflexibility. One fears that many of his best opinions have not been lived but inherited. A ripe literary Toryism is not without its charm, but its appeal can hardly be popular. Then odd lapses of taste occasionally warn us that if our preceptor were more sensitive he would possibly be less judicious. The thin and pointless colloquy with Shakespeare is disheartening. Again, such a passage as that in which a line of Spenser is commented upon makes one rub one's critical eyes. Sir Alfred quotes:

> The noblest mind the best contentment has.

What a noble line! the noblest, I think, in all literature! Let us commit it to heart, repeat it morning, noon, and night, and it will cast out for us all the devils, aye, all the swine of Pessimism.

We leave the analysis of this porcine trope to the perceptive reader. It illustrates certain reasons why Sir Alfred's criticism, while telling at times, is not quite first class.

Prof. M. L. Fernald of the Gray Herbarium has in preparation an extended work on the discovery of America by the

Northmen from Iceland, in which he investigates the details of the story in the Flateyarbook. A preliminary study of the botanical features is to be found in the February number of *Rhodora*, in which the author shows, conclusively, it should seem, that the *vinber* of the Icelandic saga are not grapes at all, but mountain cranberries (*Vaccinium vitis-idæa*); that the self-grown *hveiti* is the strand-wheat (*Elymus arenarius*), and not Indian corn; and that the *mosurr*, as the name clearly indicates, is not maple, but the gnarled birch known in Germany as Maser-birk, in Sweden as masur-björk, and in old Norse called mösurr. Through his investigations into the identity of the plants mentioned in the old saga, Professor Fernald has been able to show, not only that there is no reason to doubt the statement of the story of Leif Ericsen, but also to locate the place where the Icelanders landed as being north of the St. Lawrence.

A strange land and a people who cling with childish tenacity to the picturesque and crude customs of ages past are described by Charles Wellington Furlong, F.R.G.S., in his "Gateway to the Sahara" (Scribner). His experiences in the city of Tripoli and its neighborhood are entertainingly told, and much information is given in regard to its three principal industries, sponge gathering, esparto picking, and the trans-Saharan caravan trade. An intimate personal knowledge of the life of the caravaneer was gained in a trip of two hundred miles over some of the trade routes. A thrilling episode in it was a night's ride with Arab bandits, through which his courage and presence of mind brought him safely. Interesting accounts are given of his location of the wreck of the U. S. frigate Philadelphia, which was burned by Decatur in 1804, and a cruise in a sponge boat. The reader also gets a glimpse, as it were, of some of the vicissitudes of desert life in the touching story told the author by a Hausa servant who was captured in a slave-raid at the age of fourteen, and only gained his freedom after years of bondage. As to the future of Tripoli when freed from the Turkish yoke he has great hopes. The numerous ruins of Roman towns and the broken-down cofferdams show the possibility, through the conservation of the vast water supply and irrigation, of changing the desert into what it was in ancient times—a highly cultivated and densely populated land. The transforming agency of the present day, however, will not be the dam, but the artesian well. Thirty-six illustrations, four of which are in color from the author's paintings, with three maps, and a full index, add to the attractiveness and value of the work.

Literary *causeries* and political *chroniques*, which we are content to have pass away with the hour that gave them birth, are, in France, collected into volumes; and other volumes are written where we, as a rule, would be content with a magazine article or two. Such a book is Ernest Lémonon's "L'Europe et la politique britannique (1882-1909)," published by Félix Alcan in 550 large and closely printed pages. The author traces the change in British foreign policy from the traditional doctrine of splendid isolation coupled with an equally traditional hostility towards France and Russia, to a condition of intimate friendship with these two Powers paralleled by the growth of an intense rivalry with Germany. This is matter of the most common journalistic discussion the world over. What M. Lémonon has done is to restate, with a great wealth of documentary detail, the contents of thousands of pages of newspaper dispatches and newspaper comment. Like most contemporary French publicists, he looks with favor upon what he describes as the Triple Entente, which he hopes with time to see cemented into a second Triple Alliance as a necessary instrument for the preservation of the European balance of power. England, France, and Russia, with the coöperation of a powerful Balkan Alliance, should be in a position to hold German ambitions in check. The book is not quite a history, because all the materials for a definitive, scientific treatment are, obviously, not yet at hand. And it is not a prophecy, because the author professes himself fairly uncertain of the future. It is a book which falls into the class of *mémoires à servir*, and will prove useful chiefly to journalists in want of a compendium of the dates and outward facts of the last thirty years of international European politics.

Canon H. Hensley Henson chose for the subject of his Lyman Beecher lectures at Yale "The Liberty of Prophesying with Its Just Limits and Temper," adopting the title of a famous treatise of Jeremy Taylor (New Haven: Yale University Press). His discussion is concerned with the problems and difficulties of a progressive Anglican broad churchman, in view of the outworn formularies to which he is bound to subscribe, and his legal obligations to an orthodoxy which he has discarded. He finds that the clergyman who has won a modern attitude is in a difficult and embarrassing position, full of moral peril and distress, pressed upon, on the one hand, by official credenda, and, on the other, by the results of historical criticism and modern science. His chapter "On Reserve, and the Casuistic Problem Involved in the Preacher's Use of Scripture" is an impressive exhibition of the difficulties under which a clergyman of advanced views is forced to labor. One does not gain from these lectures a hopeful feeling as to the outlook for prophetic liberty in the Anglican church, nor is the work of the ministry made attractive by such a presentation of the burdens which a conscientious and enlightened teacher of religion is forced to bear, if he would serve in one of the great historic churches.

In the Transactions of the Asiatic Society of Japan (Vol. xxxvii, part 1), Dr. M. W. de Visser, recently appointed curator of the Ethnographic Museum at Leyden, continues his scholarly studies of the dog and cat in Japanese folk-lore, especially as the native notions are reflected in literature. The dog is regarded as a protector of mankind, and the cat as its deadly enemy; yet with exceptions. The active volcanoes of Japan, about twenty in number, which lie along four well-defined lines of geological weakness, are described from personal study by C. E. Bruce-Mitford. Prof. Arthur Lloyd defines what is still needed in the study of things Japanese. Most valuable contribution is the illustrated paper of Dr. Neil Gordon Munro on prehistoric survivals, in which he continues his demonstration of the initial occupation of the Nippon islands by the Ainu, or straight-eyed Aryan savages, now confined to Yezo.

From the Imperial Cabinet in Tokio come two volumes of the annual hygienic census and vital statistics for 1907—"Mouvement de la population" and "Statistique de causes de décès de l'Empire du Japon"—containing classification, with text in French, concerning sex, age, occupation, domicile, and diagnosis of the disorder of each person diseased; the whole set forth according to the months of the year, and divisions of the empire, with comparison of cities and districts and of previous years, and birth and death rate as to professions, etc. The same minute information is given as to births, marriages, and divorces. The diseases themselves are grouped according to the latest science, but diarrhœa and enteritis are included in "European" cholera. It is doubtful whether any other government issues so perfect a map of vital conditions under its administration as that of Japan.

Prof. William Graham Sumner, who had held the chair of political and social science at Yale since 1872, died at Englewood, N. J., on Tuesday, at the age of sixty-nine. He was born in Paterson, N. J., graduated at Yale in 1863, and studied at Göttingen and Oxford. From 1866 to 1869 he was a tutor at Yale, and he was thereafter an Episcopalian clergyman in New York and Morristown, N. J., until 1872. His books include, "What Social Classes Owe to Each Other," "Collected Essays in Political and Social Science," "Protectionism," lives of Andrew Jackson, Alexander Hamilton, and Robert Morris, "The Financier and Finances of the Revolution," "A History of Banking in the United States," and "Folkways."

Sir Robert Giffen, the English journalist, financial writer, and statistician, died in London on Tuesday at the age of seventy-three. He was sub-editor of the *Globe* in 1862-66, assistant editor of the *Economist* in 1868-76, chief of the statistical department of the Board of Trade in 1876-82, assistant secretary of the Board of Trade, and afterward controller-general of the Commercial, Labor, and Statistics Department in 1882-87. In 1882-84 he was president of the Statistical Society. He had been a contributor to the *Fortnightly Review*, the *Saturday Review*, and the *Spectator*. He was the author of "Stock Exchange Securities: An Essay on the General Causes of Fluctuation in Their Price," "Essays in Finance," etc.

Miss Catherine Helen Spence, the English journalist, editor, and author, died at Adelaide recently, at the age of seventy-four. She travelled and lectured in this country in 1893. Her better known novels include "Clare Morrison," "Tender and True," "Mr. Hogarth's Will," and "The Author's Daughter," and in 1884 she published anonymously in London "An Agnostic's Progress," written from a theistical point of view.

Joseph Hartwell Barrett, who was connected for several years with the Cincinnati *Gazette* as a political writer, and was United States commissioner of pensions in 1688-'79, died at Cincinnati on Sunday at the age of eighty-five. He had written a "Life of Abraham Lincoln" and "Abraham Lincoln and His Presidency."

Jean Moréas, the French poet, has died

in Paris, at the age of fifty-three. He was born in Athens, Greece, his original name being Papadiamantopoulos, but in 1877 became a resident of Paris, where he edited several newspapers, such as *Le Décadent* and *La Vogue*. He published "Les Syrtes," "Les Cantilènes," "Le Voyage de Grèce," "Premières Poésies," and "Esquisses et souvenirs."

Science.

"Practical School Gardening," by Percy Elford and Samuel Heaton (Henry Frowde), is doubtless a useful book in its sphere, but we are at a loss to see its value in America. This is due to the very quality which should secure its English circulation, its practical character. There is no use in telling the American boy to prepare his garden in January or to plant peas in February. Certain small sections of our country approximate the English climate, but the remainder, both North and South, differs too widely for garden rules to hold. Further, English plant varieties are not sold here, pests are not the same, nor diseases, nor remedies. Directions for all of these are therefore either useless or misleading. We give so much space to this little book because it represents a class of very attractive publications which are imported here, are sold to our amateur gardeners, and take their place on the shelves of our public libraries. They are unsafe guides, and only the expert, understanding both English and American conditions, can use them with advantage.

A much better school guide is "Elements of Agriculture," by Prof. G. F. Warren of the New York State College of Agriculture (Macmillan). This book is different in scope, being for older students, and treating of the farm rather than the garden. The writer attempts a great deal: to cover, in a book of four hundred pages, the whole practice of modern general farming. Beginning with fundamental theories and principles, and well illustrated by diagrams, drawings, and photographic plates, the book treats of plant improvement, propagation, and food; of the soil and its fertility; of crops and their enemies; of animals and poultry, the dairy and the orchard, farm management, the farm home, and even the farming community. The attempt is heroic, and one result is the inevitable disadvantage of compression; but the book is decidedly commendable for its double purpose of a textbook in high schools and colleges, and of a farmer's handbook. For both purposes its value is increased by the author's practice of appending to each chapter lists of illustrative experiments and of supplementary reading. The book and its bibliographies are up to date. It is introduced by Prof. L. H. Bailey, who promises another to follow it, suitable for the grade schools.

Professor Bailey's own most recent book is his "Manual of Gardening" (Macmillan). As is noted in its preface, the book is not new; it is a combination of his earlier "Garden Making" and "Practical Garden Book," with revision and enlargement to include recent experiment and practice. We can do no better than to record our opinion that this is the best general handbook for the home gardener, who grows flowers and vegetables, shrubs and trees, and who has an eye to the beauty of his place. The volume is attractively bound and illustrated, and its appearance reminds us of the very wide influence which Professor Bailey's books, scientific or popular, have had upon our gardeners. His work is not spectacular, but we believe that, when services are counted up, he will prove to have done for recent American horticulture more than any other one man.

For readers able to follow the very notable discussion of radical changes in therapeutical methods suggested by recent investigations—to many full of promise, to others as yet very unconvincing—the "Studies on Immunisation and their Application to the Diagnosis and Treatment of Bacterial Infections," by Sir A. E. Wright (London: Constable & Co.), may be noted. Here are brought together some twenty-five articles relating to this topic which the distinguished English physician and his collaborators have published since 1897. Wright's articles on anti-typhoid inoculation, which appeared in the *Practitioner*, are not included, having been already utilized in his little book on that subject. The other articles are mostly reprinted without change, save the omission of some technical details which the author proposes to elaborate in a special volume. The last three articles are to some extent revised, and so are said to express Wright's later views. The book is made up of two parts. The first treats of the anti-bacterial elements of the blood, while the second, much larger and more interesting, discusses immunization as a therapeutical measure, or, as it may be called, the new vaccination. The subject is too complex for detailed consideration here. Let it suffice to say that by the vaccine therapy is meant inoculation, not a prophylactic inoculation, but a phylactic inoculation against micro-organisms which have already entered the body. This is done by the introduction of certain chemical substances, undetermined as yet, which cause the body to develop other protective substances in the blood. These necessary chemical substances are found in the sterilized cultures of the particular micro-organisms in question in each case. Such a bacterial vaccine is something quite different from a serum obtained from an animal inoculated with a micro-organism, and it is indeed quite possible that the successes of serum therapy are all due to the vaccine which happens to be contained in any efficient serum. This general doctrine is not quite so exclusively due to Wright as this book may lead some readers to infer, but he has been active for some years in its development, and is especially identified with certain studies which tend to place it upon a scientific basis, particularly in the practical application of it. As early as 1903 he formulated the principle which here reappears on his title-page: "The physician of the future will be an immunization." The book also contains a list of the scientific publications of the author. The index is interesting, being elaborated to serve as a synopsis and to bring out some special points. It is perhaps worth noting that while Wright definitely named the protective substances which he finds in the blood, or at least some of them, *opsōnins* and the action of them in relation to phagocytosis the *opsōnic* effect (p. 83), writing them thus apparently to indicate the pronunciation, the new Webster records them thus: *op'sonin* and *opson'ic*.

M. Charlois, one of the astronomers of the Nice Observatory, and the discoverer of many small comets, was assassinated on Easter Sunday by an unknown person. He was forty-five years old.

Eduard Friedrich Wilhelm Pflüger, professor of physiology in the University of Bonn, since 1859, died recently at the age of eighty. He had published "Ueber die Kohlensäure des Blutes," "Die teleologische Mechanik der lebendigen Natur," "Wesen und Aufgabe der Physiologie," and "Untersuchungen über die Physiologie des Elektrotonus." He was the founder of the Archiv für die gesamte Physiologie des Menschen und der Tiere.

Drama.

A Study of the Drama. By Brander Matthews. Boston: Houghton Mifflin Co. $1.50 net.

This book, presenting in amplified form the substance of many essays upon dramatic and theatrical topics written in past years, is a comprehensive and interesting summary of the progressive steps in the development of dramatic art from the earliest classical period to our own day. In its broad outlines of general principles, conditions, and influences it furnishes about all the information on those subjects that the ordinarily intelligent reader is likely to require, while in its references to the best authorities it will be a valuable guide to the special student. It covers, if not minutely at least sufficiently, not only the English-speaking, but the principal European, stages, and the relations existing among them. From his youth up Professor Matthews has been a diligent and enthusiastic student of the theatre, at home and abroad—its dramatists, its players, and its technique—and few men are more conversant with the historical facts concerning it. In dealing with these he displays a full and accurate scholarship, and in his explanatory comments and deductions he is, in the main, perfectly sound.

But not everybody will agree with all his opinions. Most of what he says in his three chapters respecting the influence of the actor, the theatre, and the audience upon the work of the dramatist is true, and much of it obvious, but exception may well be taken to his plea in justification of those playwrights who write plays with a view to "fitting" a particular actor or actress. This practice, which the prevailing speculative and commercial system of management has made so common, has contributed, more than anything else, perhaps, to the decadence of acting and the discouragement of the capable dramatist. To argue in its favor is to put the cart before the horse. All hope of a great dramatic

revival is vain if the imagination of the author is to be restrained within the limits of the capacity of the immediately available actor. The writer who condescends to hack work of this kind—his name, of course, is legion—simply sells his artistic soul into hopeless slavery for a mess of pottage. Whether Shakespeare had or had not Burbage in his mind when he created Hamlet is nothing to the purpose. There was no syndicate then. What is certain is that no author, as the case now stands, will write a new "Othello" or "Macbeth" with any of our existing actors in view. It is true that Rostand designed Cyrano for Coquelin, but it is also true that there is much more in Cyrano than Coquelin, or any other actor, has yet expressed in action. That only means that Rostand, in this instance, is greater than his interpreters. The first need of the stage is a free field for competition. With that secured, we might reasonably expect, in due order, the great dramatist and the actor to play him. Art, whether literary or histrionic, thrives upon tribulation and struggle, not upon coddling or advertisement. And the author is more important than the actor. Shakespeare is more than Garrick or Salvini.

Again the proposition that the dramatist must give the people what they want is only partly true. As a dogma, it involves a common but most mischievous fallacy. Virtually it implies that the theatre to be prosperous must cater to the uncultivated tastes and crude instincts of the vast majority. To grant this would be to deny to it the one supreme and proper function upon which it can rest its claim to be accounted among the arts—of which it ought to be the exemplar and the epitome—to deprive it of all value as a public institution, and to degrade it to the level of the circus. Mr. Matthews is indisputably right in declaring that the chief object of the great bulk of theatre-goers is recreation, but that may be obtained and provided in an infinite variety of ways. There are folk who prefer to take it sadly. The fact is that it is almost impossible, before trial, to discover what the public really "wants," although it is tolerably easy to define what it will accept. The one sure thing is that its interest must be excited and maintained. A little reflection will show that in matters theatrical, the public—in the mass—has no way of making or enforcing a "demand." The one privilege it enjoys is the power of choice between such plays as are offered, and, as a rule, the popular judgment is acute and solid. It rarely happens that a good play, if well performed—this last is a vital point—meets with failure. This truth is evidently familiar to Mr. Matthews, who writes with much discernment on the subject of subsidized houses and on the proved capacity of the populace to appreciate and support the very highest forms of drama. Everybody admits the potentiality of the theatre for evil. It can be, and ought to be, just as powerful for good. No other institution has equal opportunities of offering—in the guise of amusement—such a variety of instruction and inspiration in art, conduct, and morals. The ambitious dramatist must seek to please his audience—that is a platitude—but only as a means to gaining higher and more artistic ends.

In his brief reference to Ibsen, Mr. Matthews is emphatic, clear, and sane, giving the famous Norwegian full credit for his remarkable skill as a constructive playwright, but insisting upon the essentially parochial spirit of his social plays. His essay on dramatic definitions is ingenious, but the terms which he employs are necessarily so elastic that it may be questioned whether their formation is worth the labor bestowed upon it. In traditions and conventions, he discusses, with much acumen, the causes which have led to the disappearance of the stage "soliloquy." But, inasmuch as the stage can never be absolutely natural, it is still an open question whether the device of the soliloquy is wholly inadmissible upon artistic grounds. That it has been abused, grossly and ridiculously, is undeniable. But, after all, many persons do speak aloud, unconsciously, when under nervous strain, and perhaps this particular conventionality is preferable, upon proper occasions, to some of the clumsy expedients often employed in order to avoid it. The distinction which he draws between the poetic drama and the poetic play is complete and just, but it should be observed that some of the really poetic dramas recently produced, failed not so much because they were essentially undramatic, but on account of the present total lack of actors able to speak or act them adequately.

William Winter, for so many years the dramatic critic of the *Tribune*, is writing a series of articles on dramatic subjects for *Harper's Weekly*. His opening essay on theatrical mismanagement is a trenchant bit of work.

The performance of "Beethoven" in the New Theatre on Monday evening—the closing production of the season—was not a triumphant success. The piece is an adaptation by Henry Grafton Chapman from the original French of René Fauchois, which was highly praised in Paris. Much virtue may have evaporated in the process of remaking. In the English version, used in London by Sir Herbert Tree, the translator was L. N. Parker. It can scarcely be called a drama at all, being simply a series of episodes partly illustrative of the life and character of the composer, who was not in all respects well adapted to stage treatment. Glimpses are given of him as a politician of rampant democratic principles, as an unlucky lover, as the inspired composer, as the victim of a cruel deafness, and as the neglected, abused, and dying genius, soothed by the vision of angelic embodiments of his own symphonies. Throughout the representation there runs an appropriate accompaniment of selected Beethoven music, which, interpreted as it is at the New Theatre by a capable orchestra, is a most pleasing feature. But the mixture of realism and fantasy does not further dramatic illusion. The dramatic qualities, indeed, are altogether inconsiderable. Interest centres wholly in the figure of Beethoven, to whom the other personages supply the necessary background, and the music. Donald Robertson, who plays the composer, is well fitted for the part physically, and not only gives it characteristic shape, but a positive and consistent individuality. He has a certain control of both passion and pathos, but not, apparently, to a supreme degree. His voice, a rich bass, is exceedingly fine, and his enunciation is clear, but unfortunately he employs but little variety of inflection.

John W. Albaugh, son of the late John W. Albaugh, actor and theatrical manager, died last Thursday in Baltimore. He was born in this city in 1867, and was only ten years old when he made his first stage appearance, dancing a hornpipe between acts at the Leland Opera House in Albany. The same year he played child parts in "William Tell" and other productions. After graduation from college he joined Lawrence Barrett's company, and three years later he went to Baltimore to take the management of the Lyceum Theatre, remaining for thirteen years. He gave up the managerial end in 1900 to give all his time to acting.

Music.

Music: Its Laws and Evolution. By Jules Combarieu. New York: D. Appleton & Co. $1.75 net.

La Musique et la Magie. Par Jules Combarieu. Paris: Alphonse Picard et Fils. 10 francs.

In the first of these two books M. Combarieu tries to prove that music is "the art of thinking in sounds"; beside a great many other things not organically related; he himself appears to have realized this, for in the final section he says: "After so many excursions into fields where I must, at times, have shown more curiosity than actual knowledge or clearness, it is time to conclude." What one misses most is a clue through the mazes of the author's statements. However, taken by themselves, the chapters repay perusal, and every writer deserves thanks who combats the notion of the Max Müller school of philologists that thought is impossible without the aid of words. M. Combarieu endeavors to show that at all times music has been cultivated as a product of original thought, distinct from the verbal thought; it is "a manifestation of a general and deep instinct, more or less hidden, but everywhere recognizable in humanity." The Hottentot who has only a few notes in his melodies thinks

in sounds as does Bach, only his thought is (from our point of view) blurred, incomplete, and barbarous.

In endeavoring to reveal the identity of primitive and modern ideas of music the author cites Wagner's statement that "the power of the composer is naught else than that of the magician. It is really in a state of enchantment that we listen to one of Beethoven's symphonies." These and similar statements by German philosophers are taken literally instead of figuratively, and thus the conclusion is reached that "the musical metaphysics of the Germans and primitive magic are one and the same thing." Musical practice, on the other hand, we are further told, is not what it was formerly. We go to an opera or a concert merely for entertainment, whereas formerly "music was associated, as an organic and essential element, with the acts of religious and profane life, of war, and of peace." Here again M. Combarieu exaggerates. In war and peace, in camp, and battle, at weddings and funerals, in joy and grief, music is as closely related with life as ever. Of this close relationship the author himself gives some quaint illustrations in his chapter on Music and Social Life, particularly where he compares the ornamental style of French music under the ancient régime with the curl-papers, the ribbons, and the patches of that time.

Darwin's theory of sexual selection does not meet with entire approval in these pages, and certainly Darwin was wrong in saying that music cannot translate fear, hatred, terror, or fury. How about "Elektra"? "Why is not the ape a greater musician than the nightingale?" is another problem to be solved. More interesting is the attempt (p. 243) to show that Ferrand and Ingegnieros were wrong in classing Victor Hugo, Andrew Lang, Théophile Gautier, Macaulay, Cuvier, and Max Müller as "musical idiots."

The few pages here devoted to magic and music are expanded in "La Musique et la Magie" to a treatise of 375 pages, with the sub-title, "Etude sur les origines populaires de l'art musical, son influence et sa fonction dans les sociétés." Though not "couronné par l'Académie Française," like the volume just commented on, it is a more scholarly and coherent treatise. In it an attempt is made to answer such questions as "Why does music hold so important a place in the history of civilization?" "Why was it associated from time immemorial with religious and social acts, with agriculture, with medicine, with love and hate, with every detail of life and death?" Musical historians generally begin with the ancient Greeks. From the tyranny of this custom the author frees himself, taking the reader much farther back, at least from the evolutionary point of view, by attempting to show that modern music sprang from primitive magic by way of "lyrisme religieux." In support of this thesis he adduces a vast number of facts relating to the magic rites and the music connected therewith of savages, barbarians, and ancient civilized peoples. We still use the word "charm" in connection with music, and, while it no longer means what it did, it recalls the time when men believed that music could compel rain or shine, love or hate; that it could heal or harm and influence life and nature in countless ways. That this belief was practically universal is what makes it interesting and important.

Before leaving for Europe, Gustav Mahler said: "Strauss has told me that henceforth he will write only operas. He says that he is done with symphonic works."

Theodore Spiering has been reëngaged as concert master of the Philharmonic Orchestra. He is assisting Mr. Mahler in the attempt to make the string family in the Philharmonic as select as possible.

Liverpool will commemorate on Saturday the diamond jubilee of Sir Charles Santley, who was born in that city in 1834 and began his musical career some fourteen years later. The chief feature of the concert to be given will be the appearance of the veteran baritone himself.

Goldmark's "Queen of Sheba," which was the sensation of the New York opera season a quarter of a century ago, is soon to have its first performance in the United Kingdom at Manchester, by the Carl Rosa Company. Goldmark, who will attain the age of eighty on May 18, spent a decade of his life writing and revising this opera.

The 11,500,000 marks needed for the new opera house in Berlin are now in hand, and the building is to be erected on Kurfürstendamm. Angelo Neumann, the veteran Prague manager, is to be the director-in-general. It was he who, nearly thirty years ago, toured various European countries with Anton Seidl and a Nibelung company.

Art.

AFTERTHOUGHTS ON WHISTLER.

A gentleman once came into a painter's studio, and in the course of chat admitted an income of fourteen thousand crowns. Before leaving, he inquired the price of a landscape and was told two hundred crowns; smilingly, he said he would call again, in hope of a lower price. On a second visit, the price was three hundred. Scenting a joke, the patron redoubled his praises of the picture and made a third inquiry. "Four hundred crowns," said the painter, "and a hundred crowns more every time you ask, and to rid myself of your importunity, and show up your stinginess, and finally, to prove that with all your fourteen thousand crowns you cannot buy one picture of mine, here goes." Whereupon the painter kicked the canvas into rags. This story is told, not of Whistler, but of one Salvator Rosa, who, more than two centuries earlier, had unpardonably anticipated many of the devices of the author of the "Gentle Art of Making Enemies." Salvator's pictures are still in the galleries, but how little the pose he elaborately maintained now matters! The time will come when Whistler's symphonies and arrangements will have no advantage in mere notoriety over the reliques of stupid men. Horsley, of whose campaign against the nude was contemptuously written *Horsley soit qui mal y pense*, may look nearly as impressive as Whistler in a museum catalogue of the twenty-second century.

Already the mere wonder of Whistler is lessening. The legend which he assiduously built up is crumbling, despite the official hagiographers. Such comprehensive exhibitions as those of Boston and London tended at once to make more normal and slightly to diminish the impression of his art. The smaller anthology now presented by the Metropolitan Museum leaves one positively rubbing one's eyes and wondering what these battles already long ago were all about. Only a few weeks since this ill-proportioned square hall was hung with Rembrandt, Steen, Ruysdael, Vermeer. The memory is a bit overwhelming. In honor of our own great *précieux*, the walls have now been draped with a crepuscular cheesecloth. It gives a certain distinction to the display, but it is not Copley Hall.

The three great portraits (what need to name them?) are necessarily absent. Everything else is well represented, though one misses such a masterpiece of the early realistic days as Westminster Bridge. For it The Blue Wave, a kind of sublimation of Courbet, is a fair substitute. The portraits are, with the exception of the etherial and baffling Florence Leyland, which the Brooklyn Museum has lent, conquerors in many previous shows. Here is that strange expression of wistful agility, the violinist Pablo Sarasate, and the fragile aristocracy of the poet Robert de Montesquiou. Here is the melancholy mask of that sorely tried and trying patron, Francis Leyland, the æsthetic ship master. In one corner, aloof, yet conscious of you, the Andalousienne glances over her shoulder; across the hall is poised in complete unconsciousness Rosa Corder, true Diana of Park Lane. Her presence almost compensates for the absence of the Mother and the adorable Miss Alexander. The absolute discretion of Whistler's art is in this portrait of a young gentlewoman. Observing the pallor of the face proudly unconscious in its setting of vibrant browns and grays, Mr. Huneker happily reads into the whole the legend of inaccessibility—*Noli me tangere*.

Beside the smaller portraits, the Japanese manner is exemplified in The Gold-

en Screen, and Lange Leizen, the blues of which are a feast, and The Ocean. Of the nocturnes and similar open-air arrangements, there are five, including the delicious Blue and Silver—Battersea Reach and the notorious Falling Rocket, which cost Ruskin a farthing and several painful quarter-hours. In what, for want of a better name, we may call the English manner are the Music Room and the Little White Girl. Singularly apart stands the big White Girl, and to crown the exhibition there is a fine group of those nudes and semi-nudes in pastel which are rather obviously called the Tanagra series. The Museums, the Freer, Whittemore, Pope, and Johnson, and Canfield collections, among others, have given of their best. So great is the diversity of style that one is reminded of the paradox of the German critic Meier-Graefe, for whom Whistler was a case of multiple personality. But under the evident variety of its components, the show has unity enough. A principle of ultra-refinement, of sensitiveness, and appealing charm runs through the whole. There is a Whistler manner as distinct as the Greuze mannerism. Realist, impressionist, mere prestidigitator—in all rôles, he is prince charming. The conviction grows insensibly, as one notes how many of these pictures lack the more substantial qualities of fine painting, that his art is one of avoidance; negative, not positive. There are certain exquisitely disciplined personalities to whom we yield ourselves unconditionally, only to perceive later, and with a little shock, that they prevail through elimination of the common and wholesome asperities. This thought we may pursue later. What is important is to note that, save for this evasive charm, all Whistler's work has taken on a more usual look. Possibly the miracle of the symphonies and arrangements depended largely upon the background of the Royal Academy, which assuredly was a world to satisfy Huxley—a world in which miracles did not happen.

Whistler's dæmon never served him better than in suggesting London. His native America was plainly out of the question. Paris, the city of Whistler's love, afforded no appropriate stage. Had he grown to maturity alongside Boudin, Manet, Cazin, Fantin, Degas, he would probably have been a better painter. This was his own opinion. But, clearly, he would have been much less of a portent. Even his wit would there have seemed not outrageous, but merely exceptional. In the Parisian drama he could hardly have been a protagonist; London from the first gladly awarded him the part of Apollyon, and trembled while it hated. The result is that we have taken his works as the cartels of a champion. Against the murkiness of the Royal Academy they have glowed like an oriflamme. Seen simply as paintings, they must take on a different aspect. That, surely, is the reason why just the shade of a chill now accompanies the attempt to renew the old, fond adventure of a soul among symphonies and arrangements.

It will clarify our vision if we go to the galleries of old masters for a moment and there take a glance at a few superlative examples of fine painting. Let us choose Vermeer of Delft, Hals in his portrait of a woman, Renoir's Mme. Charpentier among her children, Manet's Boy with a Sword. Then to the Vanderbilt Gallery, observing on the way a supreme example of charm, Rossetti's Lady Lilith. In the long corridor, for charm and masterly execution combined, let us halt before the best of the Alfred Stevenses. As we pursue the long way back, it will be well to lug in Velasquez—mentally, of course, for the Museum lacks him. Thus we shall have set for the Whistlers the very severest comparisons, and I think that only a fanatic will insist that his art, with all its winsomeness, is not distinctly of a smaller accent, at times of a rather thin preciosity. Let us ask a blunt question? Is there a superlatively fine picture in the room? The present writer is sure only of one—The Little White Girl. Surely, no time will stale the lovely pensiveness of the mood, the dulcet quality of a workmanship everywhere perfectly assured, the keen accord of the various whites. In comparison, the big White Girl is far-fetched and rapidly becoming merely odd. To paint white on white has ceased to be a marvel; in fact, it never was except in a color-blind age. Aside from this, the big White Girl is uncertainly balanced and uncomfortable to look at for long. The Japanese pictures are refined to a degree, subtly harmonized, and present individual passages of the finest color. They are so evidently mere confections—self-confessed stages towards the Little White Girl—that their analysis may be waived. The Music Room, perhaps the most accomplished of the early pictures, keeps one long in doubt. It is the most strenuously complicated of Whistler's interiors. What seems to place it just a little lower than first-class is an eccentric edginess, and some lack of complete unity. The Rosa Corder is so lovely an apparition that I will not argue the technical reasons that make it not quite a great portrait. To a discerning eye the whole of Whistler is in this canvas. Enhance it as by a *tour de force*, and you would get the Mother or Miss Alexander, transfer the manner to landscape and the symphonies and nocturnes logically ensue. The essence of it is an infallible pictorial sense. The focus of that pallid face in its setting of brown and gray is perfect. Where the picture comes a little short of the best is in a too-ready sacrifice of the beauty of definition to that of unity, in a *parti-pris* of tone which makes the artist impose the harmony arbitrarily instead of extorting it from the data. This tendency, barely discernible in the Rosa Corder, becomes pronounced in the nocturnes. There is a thrill in most of them that makes one forget their high degree of artificiality. Cazin's moonlights, in a manner far abler, lack the glamour. Millet has done the thing with equal charm and greater majesty. Whistler invented a most useful decorative formula, which he abused a little himself. His followers have shown how much of a trick it was. His art is so personal and distinguished that European painting hardly suffices to demonstrate its insubstantiality. One may fairly judge a picture like Symphony in Gray and Green: the Ocean, only by comparing it with what it simulates—the color-prints of Japan. Better yet, take landscape painting of the Chinese school. The Eastern product is finer at every point, more spacious, more mysterious, and, above all, more knowing. It gets by direct and exquisite selection from nature what Whistler got by evasion. To a Japanese connoisseur most of his work would seem superficial, and just a bit slovenly. And this means that, while he valiantly shook off the cheap naturalism of Europe, he never underwent the discipline necessary to attain to the mystical naturalism of the Far East. Artistically, he remains a man without a country.

Here he was more or less of a victim. In his etching, his most important achievement, he managed to keep his feet on the ground. Doubtless, he would have done so in his painting also, but for the presence of the "enemies." Of them he was morbidly conscious. He dwarfed himself by resolutely being as unlike the Royal Academy as possible. He moved in an atmosphere of hostility tempered by adulation equally excessive. He fatally lacked the company and the criticism of his peers. The work he did in such unwholesome isolation testifies to the extraordinary natural gift of the man. His quality, however, was not to be great, but to be charming. Possibly, the Tanagra pastels show him quintessentially. The refinement with which these little figures are set within the tinted sheet, the deftness of the spotting, the value of the sparsely applied color, a sensuousness that for being discreetly attenuated is all the more effective—such are the salient qualities of this work. It recalls, as the word Tanagra does, the subtly coquettish flavor of Hellenistic art. There is a hint of Correggio, though not his vigor, and a stronger reminiscence of the pensive charm of Watteau. Not merely in enduing the figure with a peculiarly aristocratic glamour, but, more technically, in adopting the blue tints as harmonizers, the poet-painter of Paris anticipated the poet-painter of Chelsea. By an occasional *tour de force*—a handful of

the Thames etchings, the three great portraits—Whistler imposes upon us. We fail to note how exceptional this work is. The real Whistler is not in the sabre stroke, but in the caress or the equally feline scratch. It was this that made him so readily lean toward Rossetti. In fact, his relation to the early English illustrators and painters has strangely been overlooked. Like them, he inherited much from the mannerly school of the eighteenth century. What is the title etching to the French Set, one of his most engaging groups of figures, really like? Is it not like a superlative Stothard sketch, and even more like a Dicky Doyle? Walter Crane, as a decorator, shows qualities and defects singularly akin to those of Whistler as a painter. These analogies are raised merely to show that, normally, Whistler's place is not with the men of power, but with the men of charm. In painting he must have learned much from Gainsborough and more from Turner, who, in fact, has anticipated more robustly many of the triumphs of the arrangements and symphonies.

Withal, Whistler remains absolutely personal and apart. His art, being one of avoidance, evading certain fundamental requirements of structure, is on the whole a small one, but exquisite, idiomatic, and refreshing. An excess of languor, too great a dependence upon the hypnotic effect of the merely vague, is its defect. It heralded a needed reaction against the color-blindness of the official art of France and England, but, unhappily, it set a generation of secessionists to weaving abstract and rather trivial iridescences. In the doctrine of preciousness of surface, Whistler did both harm and good. To show how really hideous was much that passed for fine painting was a public service. To suggest that manipulated pigments can or should vie with the specific beauties of ceramic enamels or Eastern weavings was to launch a forlorn hope. On this theme of "quality" much nonsense has been put about. Simply as an agreeable colored texture no painting compares with a fine Persian tile. In other words, the painter must atone in other perfections—in a masterly sense of form, in beautiful and complicated arrangements, in spaciousness, in personal interpretation of bare appearances—for the relative meanness of his materials. Whistler met these requirements only about half way, hence falls out of the class of great and well-rounded painters. His tact was sufficient to keep him clear of the more demoralizing implications of his own theories. Naturally, his imitators lacked the subtlety to see that the master frequently took himself in a Pickwickian sense. They lacked, more lamentably, the discipline of sound early studies. Without having done their Thames etchings, they undertook their nocturnes. Where Whistler was limpid, they made a virtue of deliquescence. In him were the seeds of the best and the worst tendencies in modern painting. Fighting magnificently for the decorative ideal of picture-making—a truly regenerative principle—he also reduced the painter's art to mere epidermal bloom, a dangerous counsel of anarchy. Hence no one can be quite indifferent to him. Is not this according to his strictest definition of success? Nor would one gauge too narrowly his evident limitations. He is so charming that one will generally take him at his own valuation. As time goes on, however, it will become clear that his abode in the Elysian fields is nearer the pleasant garden-houses of Watteau and Fragonard than the imposing mansions of Turner and Velasquez. F. J. M.

The Bruno-Hessling Company (New York) announces the publication of "The Château of Haar," by B. J. H. Cuypers, with illustrations showing the recent restoration of the château; "Applied Bronze Work in the Style of Louis XVI," by E. and W. Hessling, a collection of documents and photographs after the original pieces in the Musée des Arts Décoratifs of Paris, illustrating furniture mounts, trimmings, and various decorative motifs for plastic and metal work; "Stil-lehre," by O. Haebler, studies of styles for colored surface decoration, including textiles, wall-paper, etc.; "The Castle of Bruck-saler," by Fritz Hirsch, showing examples of the Louis XV style in Europe, and "The Architectural forms of the Classic Ages," by Constantine Uhde, formerly professor at the Technical High School of Braunschweig.

The paintings, tapestries, and rugs collected by the late Charles T. Yerkes were sold at auction last week at Mendelssohn Hall, in this city, the entire lot bringing $2,034,450. The general character of the collection and the doubtfulness of some of the attributions—such as Holbein, Dürer, Memling, David, Murillo, Botticelli, and Verrocchio—were referred to in the *Nation* of March 31. But the general average was high, and some of the questionable pictures had much intrinsic merit. The more important of the canvases and other articles were sold at the following figures:

APRIL 5.

Alma Tadema, Spring	$22 00
Josef Israel, Frugal Meal	19,500
Ludwig Knaus, Country Festival	10,000
Bouguereau, Invading Cupid's Realm	10,000
George Inness, Sunset Landscape	8,400
Detaille, The Retreat	6,200
Escort of the Emperor	6,000
Cazin, Artist's Studio	5,400
Meissonier, The Reconnaissance	5,300
Monticelli, Diana and Nymphs	5,200
Joseph Bail, Servants Lunching	5,100
Clays, Calm on Scheldt	5,000
Vibert, Sacrilegious Monkey	4,300
Gérôme, Pygmalion and Galatea	4,000
Burne-Jones, Princess Led to Dragon	2,950
Princess Chained	2,000
Alfred Stevens, Lady with Cherries	700

APRIL 6.

Corot, The Fisherman	80,500
Morning, companion picture to The Fisherman	52,100
Environs Ville d'Avray	20 100
Path to Village	6,800
The Old Church	4,800
Daubigny, Banks of Oise	15,500
On River Oise	15,500
Landscape at Seashore	5,000
Diaz, Gathering Fagots	30,000
Gorge in the Forest	5,600
Cupid Disarmed	3,100
Dupré, At Sea	6,300
Landscape by River	5,100
Stag in the Forest	5,100
Sunrise	5,000
Millet, The Pig-Killers	44,100
Rousseau, Landscape on River Berry	26,100
Valley of Tiffange	10,000
Constant Troyon, Going to Market	60,500
Greuze, Reverie	22,000
Boucher, Toilet of Venus	25,500
Turner, Rockets and Blue Lights	129,000
A Dream of Venice	60,000
St. Michael's Mount	8,500
Italian Landscape	8,300
Sir Joshua Reynolds, Portrait of Lady O'Brien	20,200
Romney, portrait of Mrs. Ralph Willett	6,100
Harlow, Portrait of Boy	3,600

APRIL 7.

Brueghel, Thief steals from thief; Fill well after calf is drowned; Bacon too good for your mouth and As full as an egg	$2,300
Claude Corneille, François, Duc de Bretagne	5,000
Attributed to Raphael, Holy Family and sparrow	6,200
Metsu, The Letter	17,100
Attributed to Dürer, Portrait of Hans Gunder	5,000
De Keyser, Portrait of Gentlemen	1,900
Rembrandt, Portrait of a Rabbi	51,400
Portrait of Joris de Coulery	34,500
Philemon and Baucis	32,000
Resurrection of Lazarus	11,100
Frans Hals, Portrait of a Woman	137,000
The Singers	33,500
The Violin Player and the Singing Girl	32,200
Hobbema, Old Mill	3,900
View in Westphalia	48,000
The Ford	10,000
Peter de Hooch—Interior	11,800
Music Party	7,400
The Glass of Lemonade	10,300
Jan Both, Sunset	900
Bronzino, Portrait of Lady	2,000
Jan Steen, False Players	6,100
The Siesta	16,500
Christ Driving Traders from Temple	3,500
Boors Merrymaking	9,300
Vandyke, Wolfgang, Duke of Nieubourg	2,500
Rubens, Ixion and Hera	20,500
Two Apostles	4,200

APRIL 8.

Paul Potter, Landscape with cattle and figures	$13,500
Landscape and Cattle	10,600
Dancing in the Barn	24,000
Solario, Annunciation	11,300

The Yerkes antique Oriental rugs and carpets and the tapestries were sold Friday afternoon. The former brought $281,950; the tapestries $56,950. Here are some of the highest prices paid:

Silk carpet from Ardebil Mosque	$35,500
Great Mosque carpet of Ardebil	27,000
Persian state carpet, sixteenth century	33,000
Bagdad carpet, sixteenth century	19,000
Persian carpet, sixteenth century	16,000
Persian carpet from Ardebil Mosque	15,200
Polish carpet, sixteenth century	12,300
Perso-Aram tomb carpet	10,200

The Gobelin tapestries, Vulcan and Venus, and The Rape of Europa, belonging to a set of four, brought $17,700 and $12,300, respectively.

In the London *Times* of March 26, A. Ashby of the British School in Rome gives an interesting summary of recent archæological research in Italy. In the Roman Forum the work is still going on slowly. The excavation of the Basilica Æmilia is continued; the prehistoric necropolis has been almost entirely filled in, and the Republican house near the Arch of Titus has been completely cleared. On the Palatine researches are carried on under the foundations of the eastern portion of the house of Livia. In the course of building operations within and without the city walls of Rome various finds of interest have been made, such as the discovery in the Villa Patrizi of the fragments of the base of a white marble candelabrum decorated with small niches containing statuettes; of a fine portrait bust of the first century A. D. outside the Porta Portese; and of several fragments of sculptures which adorned a peristyle found within the area of the Gardens of Sallust. On the site of the former Villa Spithoever, a fine stretch of the wall which enclosed the city of Rome in the fifth (?) century B. C., has recently been fully exposed to view. It is built of slabs of gray-green tufa, about ten inches in

height and twenty inches in length and width, and is certainly earlier than the so-called Servian wall. Explorations in some of the churches of Rome have led to important results: under the church of SS. Giovanni e Paolo on the Cælian Hill a painting, representing a mythological scene in a harbor, was found in a nymphæum. Under S. Crisogono remains of the house of the saint were found, and considerable portions of the earlier church, which was built into it. The excavations at Ostia, the ancient port of Rome, are being continued. A considerable portion of the city has been examined; a street leading to the theatre, with a portico on its west side, has been cleared; of the objects discovered the most important is a fine statue of a lady of the imperial house, with the attributes of Ceres, probably dating from the reign of Hadrian. On the property of the King of Italy near by was discovered one of the three public baths which Pliny the Younger mentions as existing. North of Rome, at Ferento, near Viterbo, ancient baths and the interior of the theatre have been cleared; in the former a number of Roman inscriptions came to light. Pre-Roman tombs were discovered at Terni, Pavia, Este, near Padua, and at Belmonte and Fermo, in Picenum. Excavations carried on near Teano, on the property of Baron Zarone, brought to light the remains of important Roman thermæ, situated close to some mineral springs. At Pompeii a certain amount of work has been done, including the excavation of a pre-Roman necropolis, and much attention has been devoted to the restoration and preservation of the houses discovered in 1902-5.

Louis Lemaire, the French painter of landscapes and flowers, died recently in Paris, at the age of eighty-six. His pictures were frequently exhibited in the Salon.

William McTaggart, the Scotch landscape painter, died recently at his home in Mid Lothian, at the age of sixty-five. One of his highland scenes, The Storm, was bought by Andrew Carnegie twelve years ago for £1,000, and there are examples of his work in the Royal Glasgow Institute of Fine Arts, and in the Royal Scottish Academy, of which he became a member in 1859, while in 1870 he was elected an Academician.

Finance.

GOLD EXPORTS AND MONEY MARKETS.

Export of $7,500,000 gold from New York to London last week is not on its face at all an unnatural operation. During the first two months of the present year this country had imported $48,000,000 more foreign goods than in the same months of 1909, and had exported $12,000,000 less. In February, imports had actually run beyond exports—the first occasion in seventeen years when this had occurred at such a time of year. There have been occasions when a trade position of this sort has been offset, in a natural way, by import of foreign capital for use in our money markets, or by European purchase of American securities. Some considerable sales of our new issues of stocks and bonds have, in fact, been made to Europe during the present season—notably part of the New York city loan—and this export of securities undoubtedly served in a measure to balance the merchandise trade account. But of the usually much more important flow of European capital into our ordinary market loans, there has been virtually none. There was little inducement for it, when our own Wall Street money rate was well below the short or long-time rates on Lombard Street.

It is not only true, indeed, that England has lately been increasing her exports of merchandise to us because of the abnormal American demand, and decreasing her imports because of our cotton shortage and our exorbitant price of wheat. For use of the world's capital, also, London has been of late the predominant bidder, and it is this which has found indirect expression in the flow of gold to England, both from New York and from portions of the Continent. This English demand for money has an exceedingly interesting double cause—the wild speculation in a mass of new-fangled rubber and oil company shares on the London Stock Exchange, and the absence, at the Bank of England, of a reserve such as markets would prefer to see in the face of such speculative unsettlement. Last week's report of that institution, indeed, shows the lowest ratio of reserve to liabilities of any corresponding week in eleven years. It is not at all surprising, therefore, that the London bank rate should already have been advanced last month, and that a further rise should be looked for in the near future.

The excited speculation now in progress on London's Stock Exchange has an indirect, rather than a direct, bearing upon this situation. Undoubtedly, the rapid enhancement of values for that market's newly-issued rubber-company shares increases whatever strain already exists on capital supplies; and when, in response to the public's speculative appetite, $8,000,000 of such shares have been floated in a single week—with some of such issues, according to current London dispatches, rising at once to a premium of 300 per cent. over the subscription price—the credit market could hardly fail to be influenced.

But it is not the "rubber boom" alone which the markets have to keep in mind. Applications for new capital from all sources—governments, cities, railways, and corporations—reached on the English money market, during the past three months, a total not matched in any previous quarter of that market's history. The £99,300,000 new securities thus placed in London, up to the close of March, run far beyond the highest quarterly record either of the Boer War period or of the era of excited Argentine promotion prior to 1890. Nor does the London market have only the new English borrowings to consider, or even the heavy applications of foreign governments. It knows that the American market for new security issues has for some time past been looking to London for the capital which, on account of the magnitude of those issues, has become considerably less easy to obtain at home.

The converging of this pressure, in so unusually aggressive shape, upon the London market is a particularly interesting fact, because London, as the world's central market for credit and capital, reflects conditions throughout the world. The rather obvious inference, from a situation of the sort, is that the world at large has lately been going ahead too fast in exploiting capital. It is answered that the world-wide rise in prices of commodities has of itself served to swell these requisitions as compared with former periods, because larger sums of money than a decade or so ago are required to-day to purchase the same materials. Even battleships cannot be built by governments on any such terms as would have sufficed ten years ago. But granting this factor in the situation, it should be apparent that it merely explains but does not remove the difficulty.

Furthermore, there is pretty good ground for arguing that higher prices are only a partial cause for the larger demands on capital. The fact that battleships to-day cost more than in 1900 certainly has not inspired in governments a determination to be circumspect in their plans for such expenditure. On the contrary, the programme of the day, in almost every important state, is for the building of more warships than ever before and larger warships than ever before. It is difficult to doubt that a more or less similar tendency has been running through the plans of other branches of finance and industry. Merchants, manufacturers, and railway companies not only are paying higher prices for their materials, but are making and carrying largely increased amounts. What the situation in the world's markets for capital must

Financial.

Letters of Credit

Buy and sell bills of exchange and make cable transfers of money on all foreign points; also make collections, and issue Commercial and Travellers' Credits available in all parts of the world.

No. 59 Wall Street, New York

mean, then, is that some sort of modification must be made in these ambitious plans. Individuals who have become extravagant, and who have been encouraged, by a long era of easy credit, in the habit of living beyond their means, are apt to get their warning from the money market, and to find their condition better in all respects if they accept the warning. On a larger scale, the case is no different with governments, cities, and corporations.

Really This Week

By a Former Literary Editor of The Evening Post

GEORGE CARY EGGLESTON'S
RECOLLECTIONS OF A VARIED LIFE

By the author of "A Rebel's Recollections," etc., with portrait. 344 pp.+8 pp. index, 8vo, $3.00 net, by mail $3.20.

These reminiscences of the veteran author and editor are rich in fields so wide apart as the experiences of a hoosier schoolmaster (the basis for the well-known story), a young man's life in Virginia before the War, a Confederate soldier, a veteran in the literary life of New York. It is a vivid book, full of good anecdotes. "Jeb Stuart," "Fitz Lee," Beauregard, Grant, Frank R. Stockton, John Hay, Stedman, Bryant, Parke Godwin, "Mark Twain," Gosse, Pulitzer, Laffan, and Schurz are among the many who appear.

The author was born at Vevay, Indiana, 1839, practised law in Virginia; served in the Confederate Army, was Literary Editor of the New York *Evening Post* for 6 years, Editor of the *Commercial Advertiser* (now the *Globe*); and for 11 years Editorial writer for *The World*.

"There are few American men of letters whose Reminiscences would seem to promise more. The man's experiences cover so wide a period; he has had such exceptional opportunities of seeing interesting men and events at first hand."—*The Bookman.*

CLAYTON HAMILTON'S
THE THEORY OF THE THEATRE and Other Principles of Dramatic Criticism.

By the dramatic critic of *The Bookman* and author of "Materials and Methods of Fiction." $1.50 net. By mail $1.62.

A few of the chapters are: The Psychology of Theatre Audiences—The Actor and the Dramatist—Stage Conventions in Modern Times—Emphasis in the Drama—Tragedy and Melodrama; Comedy and Farce—The Modern Social Drama—Dramatic Art and the Theatre Business—The Happy Endings in the Theatre—The Boundaries of Approbation—Dramatic Literature and Theatric Journalism—The Effect of Plays Upon the Public—The Function of Imagination, etc., etc.

Henry Holt & Company 34 W. 33d New York

BOOKS OF PERMANENT VALUE.

A History of Architecture
By RUSSELL STURGIS
Volume II (now ready, Volume I already published) covers the later Romanesque, Asiatic architecture, and Moslem architecture. These fields are illustrated by a wealth of half-tones, line cuts, and handsome photogravures—400 in all. Imperial 8vo. 480 pages. Cloth. $5.00 net per volume. Carriage extra.

Medieval Architecture
By ARTHUR KINGSLEY PORTER
Presenting the early history of architecture, with special relation to the Gothic. Two vols. Quarto. 289 Illustrations. Per set $15.00 net.

Modern Artists
By CHRISTIAN BRINTON
A brilliant study of recent art, biographic and critical. Imperial 8vo. 270 pages. 60 Illustrations. Net, $6.00.

Retrospections of an Active Life
By JOHN BIGELOW
A record of long and arduous public service in historic setting on two continents. A piece of the history of the past fifty years. 8vo. Three vols. 48 Illustrations. Net $12.00. Carriage extra.
Portrait catalogue, in preparation, on application.

THE BAKER & TAYLOR CO.
33 East 17th Street, New York.

Orpheus
A General History of Religions
By SALOMON REINACH, Author of "Apollo," etc.
8vo, with Colored Frontispiece, $3.00 net.

"The volume gives ample proof of that wide erudition which we expect from this author. . . . The style of the book is delightfully epigrammatic. . . . Beginning with theories of anthropology and myth, M. Reinach states with persuasive skill many debatable dogmas. . . . He generalizes with all the grace of an accomplished English scholar. . . . The bibliographies testify to the wide range of the author's investigations."—*London Athenaeum.*

VOL. XC.—NO. 2338. THURSDAY, APRIL 21, 1910 PRICE TEN CENTS.

New Books From Dutton's List

Recent Progress in the Study of Variation, Heredity and Evolution

New and Enlarged Edition.

By ROBERT HEATH LOCK, M.A.

Illustrated. Price, $1.50 net.

Readers who remember the highly theoretic and controversial character of the early works on Evolution will find this book an interesting measure of the difference in methods of investigation as well as of the advance in knowledge along these lines of study. Twenty years of patient experimenting in biological laboratories, and the work of DeVries, Mendel, and Galton have created a fund of definite information to replace what was called, a quarter of a century ago, "the Darwinian hypothesis." No subject in the whole range of the physical sciences has commanded so much interest as this, and the present volume with its comprehensive view of the whole field will appeal to a wide circle of readers. The chapters on Recent Cytology and Eugenics are especially interesting.

On Everything

By H. BELLOC

Price, $1.25 net.

These short papers—the volume contains one fewer than forty—are episodes rather than essays; witty and compact delineations of ideas and incidents as a more frugal author might have set them down in a notebook for future development. The impulse of lavishness which prints them in the present concentrated form has made a book of unusual charm and merit.

The Meaning of Money

By HARTLEY WITHERS

City Representative of *The Times*

Price, $1.50 net.

Financial News: "There can be no doubt that Mr. Withers's book will supersede all other introductions to monetary science. . . . Readers will find it a safe and indispensable guide through the mazes of the Money Market."

Manchester Guardian: "No common measure of literary accomplishment; a lucid, forceful and pointed style, and a good store of material for apt and often amusing illustration have lent both grace and charm to a work of quite exceptional utility."

A History of Gardening in England

By The Hon. MRS. EVELYN CECIL

Illustrated. Price, $3.50 net.

Gardening in England is so ancient a science that its early records have an antiquarian rather than a practical value, yet the essentially permanent nature of garden lore crops up on every page. The gardener in Westchester, or Orange, or on Long Island, must still plant his bulbs according to XIVth century directions, 3 inches deep with a "Dybble" and

"Thay wold be sette yn the moneth of September
Three days by-fore seynt Mary day natyvyte."

Beginning with the interesting relics of monastic gardening, the book follows the centuries to the dawn of landscape gardening and formal work in the modern school. Interest is added by the fact that specimens of every period described still survive in England and are reproduced for the delight of those who love gardens of any period.

Health Progress and Administration in the West Indies

By SIR RUBERT W. BOYCE

Illustrated. Price, $3.50 net.

This writer on sanitation has gathered in a volume the results of an extended trip made last year to the West Indies to investigate the epidemic of yellow fever prevailing there at that time. The assistance of officials of every rank and the trained observation of the writer have united to make an unusually accurate and detailed record of what may be accomplished by modern methods in the prophylaxis of tropical diseases. While the sanitary work is necessarily similar to that of the United States engineers on the Isthmus, there are interesting points of difference which will repay study.

Air and Health

By RONALD MACFIE, M.A., M.B.C.M.

8vo. $2.50 net.

This book deals with the physical and chemical properties of air, particularly with reference to health and disease. The physiology of respiration is considered in its practical bearings, and chapters are devoted to the question of climate and to relevant questions of dust, fog, germs, air-borne epidemics, etc. Ventilation is fully discussed, both in private and public aspects.

A LIVING HISTORY BY LIVING MEN

FIFTY YEARS OF NEW JAPAN

An English Version, edited by MARCUS B. HUISH of Gojunen Shi, compiled from the writings of Japan's foremost writers and statesmen. With preface, conclusion and other valuable matter by the general editor,

COUNT SHIGENOBU OKUMA.

This remarkable book presents, with the highest possible authority, the history of Japan's progress and development from the time of her first treaties with the outside world to her present place of power among the nations. The foremost contemporary authorities in every department of Japanese life have contributed to the wealth of information in these volumes, making them unique in their completeness, accuracy, interest and scope.

"As a book of reference it is invaluable."—London Times.

2 Volumes, Cloth, Net $7.50.

Theism and the Christian Faith

By CHARLES CARROLL EVERETT
Late Professor of Theology in the Harvard Divinity School

Octavo. Cloth. 491 pages. $2.50.

The Auburn Seminary Record says:

"A book which . . . no thoughtful minister can well afford to leave out of his library, unless he can borrow it. . . . The calm, impartial discussion of great themes in these pages."

The Christian Register says:

"This book again brings to one's notice Professor Everett's almost unrivaled faculty for illustration. . . . Perhaps no book dealing with the themes of which this book treats was ever before published so abounding in a wealth of aptly chosen illustrations. . . . To the preacher who is dealing with life at first hand, and who wants ideas that are immediately applicable to the needs of human souls surrounding him, this book is of the highest value. . . . Few books on homiletics are half as useful to the man who has a weekly sermon to produce, for here are practically all the themes on which the preacher needs to speak set forth in outlines with convincing power."

20 VESEY ST. The Nation NEW YORK

Important New Macmillan Books

"READERS HAVE LONGED FOR YEARS FOR JUST SUCH A NOVEL FROM

Mr. Winston Churchill's PEN AS A Modern Chronicle"

The critics are saying that "to call it completely absorbing is to describe it mildly. . . . Each one of Mr. Churchill's books has immensely enriched American fiction—this, perhaps, most of all."

"EXTRAORDINARILY WORTH WHILE."

Mary S. Watts's Nathan Burke

Sunny, delightfully entertaining, every page of it making one smile over some unexpected human touch—the sort of book which makes you glad that Nathan (beg his pardon, *General* Burke) lives and proud to know him. *Ready this week. Cloth,* $1.50.

Gertrude Atherton's Tower of Ivory

"A story that is told with splendid energy and variety, a story that engages the eye and enamours the brain. . . . No novelist since Victor Hugo has a situation and setting finer." *Cloth,* $1.50.

Robert Herrick's A Life for a Life

By the author of "The Common Lot," "Together," etc., beyond dispute the most authoritative analyst of American life now writing fiction, whose work is, as Mr. William Dean Howells expresses it, "a force for the wider civilization." *Ready in May.*

READY THIS WEEK.

F. Marion Crawford's The Undesirable Governess

Mr. Crawford's last unpublished fiction, unexpectedly humorous, full of deliciously amusing observation of the intimacies of English country home life. *Cloth,* $1.50.

Published by THE MACMILLAN COMPANY 64-66 Fifth Ave. N. Y.

The Nation.

NEW YORK, THURSDAY, APRIL 21, 1910.

The Week.

"The vice of every tariff bill comes from the ease with which the well-informed special interests can hoodwink legislators who do not know the facts"—thus Mr. Seth Low, at the Republican Club in New York on Monday night. Oh, no, Mr. Low. The protected interests do not have to hoodwink the legislators. The latter do not wish, and never have wished, the facts. Their business is buying and selling—buying campaign contributions and political influence by the sale of the privilege to grow rich by aid of the government of all the people of the United States. The Ways and Means Committees or special commissions have often enough collected facts—has Mr. Low forgotten the Tariff Commission of 1882, and what came of it?—only to see them discarded unread when the tariff hogs came to the trough. The Republican leaders were not easily hoodwinked about things political; but the only fact Mr. Low's party cares about at such times is the size of the bids for government aid in making profits. The Tariff Commission now devised is a very useful body, beyond doubt. But nothing on earth will make the protected interests pay any attention to its facts, and to date they have been the masters of the Republican party. As matters now stand, those likely to profit most by the Tariff Commission's labors are tariff reformers or free-traders of the radical stripe. Every protectionist will pull every wire to suppress the damnable facts sure to come out.

An interesting contribution has been made to the discussion of the income-tax amendment to the Constitution of the United States, in the memorandum submitted to the New York Legislature by Joseph H. Choate, William D. Guthrie, Victor Morawetz, Austen G. Fox, and John G. Milburn, and in the partly concurrent and partly divergent memorandum by Francis Lynde Stetson, appended to the former. A sharp distinction should be made between two aspects of the opinion declared by the five eminent lawyers first mentioned. On the issue raised by Gov. Hughes, referring to the Constitutional and political effect of the words "from whatever source derived," the pronouncement made in the memorandum is not only characterized by the legal weight which might be expected from its authorship, but is highly impressive from the point of view of the layman. Indeed, ever since the announcement of the Governor's opinion on this point, the discussion of it has brought out with more and more clearness the soundness of his position—that the authorization, by Constitutional amendment, of Federal taxation of incomes "from whatever source derived" would almost certainly have the effect of annulling those limitations on the taxing power of the national government which have hitherto rested on inference from the general principles underlying our system of federated States. And this memorandum serves not only further to enforce this point, but also to bring out its potential importance in the affairs of the future.

But the memorandum of the five lawyers does not stop here: it goes on to attack the principle of the income-tax amendment, irrespective of its effect on State obligations. Here it enters upon the domain of general statesmanship, and takes up a position with which the legal authority of the writers has no bearing. They assert that to do away with the necessity of the apportionment of an income tax among the States according to population would be to open the door to a conscienceless exploitation of the richer States by the poorer States. That the amendment is designed to enable the national government to obtain from the possessors of great wealth and consequently large income a greater contribution to the national expenses than they now make, is undeniable; and that if this were done most of the tax would come from the States in which there is most wealth is equally certain. It is even possible that the power, if it existed, would be used in a manner that is open to serious objection. But when the eminent lawyers say that if a direct tax were now levied and apportioned according to population, the more populous and richer States would be paying their full share of national taxes, they weaken their whole position. Whatever the merits of their case, it is certainly not advanced by an argument which could justly be reduced to a burlesque by applying a similar consideration to a tax levied on the various sections of New York State, or New York city, according to population. Mr. Stetson, on the other hand, while recognizing the full force of the objection based on the words "from whatever source derived," and while admitting the possibility of abuse in any event, rightly asserts that an income tax apportioned by population is out of the question, and expresses his readiness to approve an amendment not open to the objection made by Gov. Hughes.

It is well to have men like ex-Gov. Herrick of Ohio who are prominent in the business world lay emphasis upon the waste and extravagance in the conduct of the government's business, if only that it may stimulate the Administration at Washington to greater efforts in this direction. There lie laurels enough for any President, even if you cut in half Senator Aldrich's estimate that the government, if run as a private corporation, might save $300,000,000. A government never can be run like a private business, because it is a Trust and has no competition; but an enormous amount could be saved if business methods were employed. Thus, in one office in Washington the installation of adding machines has saved the salaries of seventy clerks. In the Treasury Department, Secretary MacVeagh is busily making savings and adopting modern methods. But nothing is done in the War or Navy Departments, where much of the greatest waste goes on. The savings that could be made in the Quartermaster's Department of the army alone would make Mr. MacVeagh's notable economies seem comparatively trifling.

Anything more outrageous than the pardoning of Col. Duncan Cooper, one of the murderers of ex-Senator Carmack of Tennessee, has not occurred in many a month. The Supreme Court of Tennessee had just affirmed Col. Cooper's sentence of twenty years, when the Gov-

ernor instantly pardoned him. This brings both the law and the Supreme Court into contempt, and is from every point of view a disgrace to the State. The Governor says he has read all the evidence; that, in his opinion, neither of the defendants is guilty, and therefore as far as possible he annuls the action of the Supreme Court. He thus asserts that the Supreme Court judges are not as good jurists as he, or that they have deliberately connived at a miscarriage of justice. This is interference with a coördinate branch of the Government, with a vengeance. Moreover, in the matter of Col. Cooper's son, for whom a new trial had been ordered, the Governor prejudges the case by asserting this man's complete innocence. As to the case itself, there never was a clearer one. Carmack was brutally shot down in the street—as brutally as was Stanford White by Harry Thaw. The Governor's action will stimulate the gentle Southern pastime of shooting editors, and will generally be used for decades to come as an excuse for lynchings and private vengeance.

We congratulate the Delaware, Lackawanna and Western Railroad on its decision to submit to arbitration the differences between management and men. It is an evidence of great confidence on its part in the integrity and judgment of the arbitrators in the case of the New York Central that the Lackawanna Company should be willing to adopt and abide by their ruling in that case. However truly it may be asserted that this decision on the part of the company is really a victory for the men—gained, it may also be said, only when the strike menace had grown into an actual strike order—it is a hopeful sign, nevertheless, that this powerful company should adopt the sensible plan of arbitration, rather than the obdurate and atavistic method of strike and lockout. It would be difficult at this time to judge of the merits of the demands that the employees of this railroad have made, although it would seem that they were justified in asking that which the employees of other roads have recently gained, either through their own initiative or by the voluntary action of the management. The significant point, however, is not the justice or the lack of justice of their demands, but the manner in which those demands are to be met—by discussion, by examination of the claims of both sides, and by a calm decision.

Following up its excellent action in cutting down the amount of Sunday labor in its various plants, the United States Steel Corporation has taken another noteworthy step forward by instituting a voluntary "employers' liability relief system" for its workmen. The payments the Corporation plans to make will be quite irrespective of its legal liability. During temporary disablement single men will receive 35 per cent. of their wages and married men 50 per cent., with an additional 5 per cent. for each child under sixteen and 2 per cent. for each year of service above five years. In case of death of the wage-earner the widow and children will receive one and one-half years' wages, with an additional 10 per cent. for each child under sixteen and 3 per cent. for each year of service of the deceased above five years. The Corporation announces that for some years past it has been paying more than a million dollars a year to injured employees and to their families. Its new scheme will be tried for a year to see how it works, and the Corporation announces that "it is our purpose by this plan to treat employees fairly and generously, even under the most enlightened view of the employer's responsibility." It also announces that it has under consideration the pensioning of disabled or superannuated employees.

New Zealand frozen mutton is no longer a mere possibility for New York. This mutton is actually now coming in over the 1½-cent-a-pound duty, and is on the market. The first considerable shipment, 891 carcasses, arrived last week, trans-shipped at London for America, and larger consignments are on the way. Dealers here have figured that they can pay both the freight and the duty and still make a profit at prevailing prices. It is a trade development of the past month, and an extraordinary example of the annihilation of difficulties and distance by scientific methods and the modern giant freight-carriers. Should this diversion of part of the vast shipments from New Zealand to London grow to importance, it may throw an interesting light on previous profits within the tariff wall. It may even indicate a simple and quick way of reducing the price of mutton by 1½ cents a pound.

The report that a party of four men from Fairbanks, Alaska, has succeeded in scaling Mount McKinley seems to be entitled to credence. The men were experienced mountaineers and evidently set about their task in a manner which bespoke intelligence as well as determination, and under unusually favorable conditions. Furthermore, the fact that all four of them are reported to have reached the summit has its significance, since an agreement involving four men in falsehood would obviously be dangerous, as the experience of Dr. Cook with only one fellow-conspirator has pretty well demonstrated. In the history of Mount McKinley there are some remarkable facts which it seems worth while to mention here. The United States Geological Survey puts its altitude at 20,464 feet, thereby making it the highest peak in North America. It is curious, however, that this great American mountain seems to have escaped the observation of Capt. James Cook when he explored the southern coast of Alaska in 1778, and it is not mentioned by Vancouver, who visited the same region fifteen years later, probably because it chanced to be hidden by clouds from both of these explorers. Nor is there, so far as we know, any written mention of the mountain by the Russians, within whose domains it continued until 1867, when Russia sold Alaska to the United States. Lieut. Henry T. Allen noted the great peak when he was exploring the lower waters of the Tanama in 1885, but evidently was not very much impressed with it, and even the earliest of the gold-seekers, in 1895, were similarly indifferent. W. A. Dickey, in 1896, first appreciated the physiographical importance of the peak, and suggested its present name. But it was not until it became associated with the great Cook fraud of the North Pole that our highest mountain came within popular knowledge.

The addition of an optional fourth year's work to the curriculum of the Harvard Law School is of considerable significance. The Harvard Law School was established in 1817, with a course of a year and a half; in 1839, this was increased to an optional two years, though few students took advantage of

the full course, and the degree of bachelor of laws was awarded upon the completion of the shorter period. In 1870 the full two years were prescribed for the degree, and in 1877 another year was added, while in 1897 the university adopted a rule providing that no student could enter the Law School who was not a graduate of an approved college or qualified to enter the senior class at Harvard; and this restriction was still further increased subsequently by a rule requiring all candidates for the degree to be college graduates. This steady increase in the actual amount of serious and definitely prescribed training for the bar becomes the more significant when we remember that only thirty years ago the very notion of a law-school was openly pooh-poohed by many lawyers of recognized standing, who contended that the only way to learn to be a lawyer was to read law in a lawyer's office, and incidentally study at first hand its practical application. The increase in intellectual equipment still regarded as desirable is shown by the provision that in this optional fourth year at Harvard the student takes up such subjects as legal history and jurisprudence, international law, Roman, French, and German law, and the law of our Spanish colonies.

The excitement and tumult in the House of Commons, when Mr. Asquith carried through his anti-Lords resolution, has served to put at rest the notion that the impending contest will arouse no such interest as attended the Parliamentary canvass of last winter. It would argue such decline of political feeling in England as is in no way indicated, if a situation clearly portending one of the gravest Constitutional changes in British history could be viewed otherwise than with the most intense interest by the whole people. That the issue will be sharply defined, and that the result of the coming election will be looked forward to as settling it, seem assured by Mr. Asquith's declaration. There is a certain amount of mystery in his statement of the action the Ministry will take, in its relations with the Crown, upon the rejection by the House of Lords of the resolution which reduces this veto power to a strictly limited supervision; but, whatever form that action may take, it will evidently go as far as is possible toward making the result of the next election decisive. Of course, Mr. Asquith has no idea of procuring from the King a creation of peers at the present time for the purpose of forcing the will of the Commons upon the Lords; but it is plain that he means to put the case in such a way as to make it inevitable that, in the event of a Liberal victory in a new election, Lords and crown alike will, by one means or another, be compelled to accept the result.

Obviously, however, there is one event —and that by no means a remote one— against which it is impossible for Mr. Asquith to provide by any practicable prearrangement. A promise from the King, or a "gentleman's agreement" between the King and the Ministry, that in the event of a Liberal victory the Lords are to be shorn of their power, could hardly be enforceable in case the result of the election was very close; no moral force would stand behind the proposition that a permanent change of the most profound character in the British Constitution must be acquiesced in by the coördinate chamber and by the Crown simply because in a single election one party had won a bare majority over the other in the House of Commons. In what way this point may be guarded, it is, of course, impossible to say; but King Edward is a wary gentleman, and will not overlook his defences. But, however all this may be, the feeling of the electorate will inevitably be that on their verdict will depend the acceptance or rejection of the proposal to reduce the House of Lords from its position of a great bulwark of conservatism to the rôle of an occasional bar to hasty legislation.

In the London *Times* of April 9 is given a plan for a reformed House of Lords which appears to have been circulated in pamphlet form with a view to crystallizing opinion among the Opposition peers. According to this plan, the House would consist of 350 "lords of Parliament," of whom 120 would be "elected by their peers," 30 would hold office by virtue of their positions, and 200 would be named for life by the Crown upon the advice of the Prime Minister. This would reduce the number holding by the hereditary principle to about one-third of the whole, and as to the remaining two-thirds, would give an equal chance of representation to the opposing parties, thus materially diminishing the force of one of the gravest objections to the existing condition. On the other hand, it should be observed that the power of the Crown —that is, of the Ministry for the time being—to reverse a majority in the House of Lords by the creation of peerages would be decidedly impaired. The King could create peers, just as is now the case; but all that the new peers could affect is the choice of the elected "lords of Parliament," of whom only one-tenth are chosen in any one year. It is a singular situation, that after all these years the problem of how to reconstitute the House of Lords should now have to be attacked almost as though it were entirely new.

Baron Komura's plain avowal of Japan's desire to restrict emigration of the Mikado's subjects to Manchuria and Korea has an important significance for this country, in view of the approaching negotiations for commercial treaty renewals in which Japan will undoubtedly refuse to recognize further any specific discrimination against her people. It is in the controlling motives that the substance of this delicate issue must be sought. The Japanese Government gives the stamp of its approval to a policy which aims to keep its people as near home as possible. It is felt that the salvation of Japan, with 150,000,000 Russians and three times as many Chinese close at hand to the West, can only be worked out by a policy of solidarity. Her population must be increased, not scattered. Emigration is not officially wanted, either to North America or any other distant continent. But there is a national pride which will not continue to ignore any direct, formal ban placed by a foreign Power on such emigration as the Government cannot control. Should Japan object vigorously to a renewed discrimination, her course would not necessarily mean an encouraged invasion of our Pacific States by more Asiatic labor. Nations, as well as statesmen, may claim a right of freedom in action, and take it for granted that they will be presumed to behave with discretion and good-will. A clear understanding of Japan's ideas and ambitions may serve to allay criticism and suspicion at a needful moment.

DISCLOSURE AND PUNISHMENT.

The country is going through an extraordinary experience in the fight against corruption. The activity displayed in the exploration of dark places, and in the "rounding-up" of scores of offenders, is a most wholesome thing, and full of encouragement for the future. Not to be afraid to turn on the light—not to balk at the uncovering of such a mess as that at Pittsburgh, for example—is the next best thing to being free from the evils against which the exposures are directed. And it is certain, too, that every such manifestation of public determination has lasting results. It will be long before things can get as bad again at Albany, at Columbus, at Pittsburgh, as they were before the work of cleaning out the stables was undertaken.

But there is one part of the task of improvement, and that an immeasurably important one, upon which we are in a lamentably weak position. Severe punishment through the machinery of the criminal law, is still no regular part of the American programme in these matters. Even in so crude and flagrant a case as that of the systematic stealings of the Sugar Trust, we do not seem likely to get very far in that direction. "It is felt here by those most directly concerned," said a Washington dispatch the other day, referring to the sugar frauds, "that there has been created at New York city an exceptionally effective agency of investigation which is fully competent to bring about the discovery and conviction of the guilty, and to cause to be returned to the government all moneys of which it has been fraudulently deprived." We trust that all this is fully true, but we add that the two objects referred to are not at all to be coupled together in point of importance. Moneys due the Government should, of course, be recovered; but this of itself should not be regarded as even in the smallest degree a punishment. To be effective, these sugar prosecutions must actually result in severe personal punishment of those primarily responsible for the crimes. We hope that this can be compassed; otherwise, exposure by a thoroughgoing Congressional inquiry, with the heavy moral punishment that such exposure carries with it, would be far more to the purpose.

That we do not get the proper infliction of legal punishments is due partly to our laws and judicial procedure, and partly to the national temper. On the first head, the country has been hearing a great deal in recent years; and from President Taft down, the sentiment has been emphatically expressed by every speaker and writer on the subject that our legal methods are in need of radical improvement. The difficulty of carrying a prosecution to a final and substantial issue, when the resources of the defence are abundant, is almost overwhelming. On one phase of the matter, formerly inconspicuous, attention has been frequently directed in the last few years—the immunity plea. Fear of that plea, for instance, is the reason for the Administration's objection to a Congressional investigation in the sugar frauds; and all along, the immunity plea has been a great stumbling-block in the prosecution of offenders against the Anti-Trust law. In a recent address discussing deficiencies in the administration of the criminal law, Mr. Untermyer placed foremost among the needed changes an abrogation of this kind of immunity. But it is curious to find in the same address a protest against the movement to cut off that abuse of the right of appeal which does more than any other one cause to rob the criminal law of its efficacy—a position for which, so far as we can make out, the only substantial support is that a man, after being convicted and after having undergone a large part of his punishment, has now and then been found by the highest court not to have been guilty. But if that is to be held a bar, we might as well give up punishment altogether; for, appeal or no appeal, there are bound to be some instances of erroneous conviction.

But in addition to any deficiencies in law or in judicial practice, the national temper plays a large part in the matter. We are a good-natured people; it goes against the grain with us to inflict severe punishment in cold blood. In part, too, it is the American sense of fair play that stands in the way—an admirable quality, of course, but sadly misapplied. The ease with which the Morse petition has found thousands of signers is due, above all, to the feeling that there are plenty of others just as bad as Morse, who, instead of being in prison, are in the enjoyment of wealth and luxury; and next after this, to the feeling that he is a plucky man, who has shown grit in adversity. Here, then, we have both the national sense of fair play and the national good-nature; with the consequence that in one of the extremely few cases in which a criminal belonging to the millionaire class has received a sentence commensurate with his crime, the moral effect is almost wiped out by a widespread manifestation of public sympathy. It is not too much to say that, before we can hope to get ride of the plague of corruption which has recently been so much in the public eye, we shall have to get over these amiable weaknesses. We cannot permanently put down blackmail and legislative graft and bank-swindling unless we show that when we catch a blackmailer or a grafter or a bank-swindler we regard him as a full-fledged criminal and treat him as such; that we are no more likely to consider how many uncaught ones are just as bad as he, or how somebody else would have acted if he had been in his place, than we do when we catch a pickpocket or a burglar or a counterfeiter. When the criminal law is administered with reasonable expedition and simplicity, and when public sentiment takes a firm and business-like view of what the criminal law is for, it will not be necessary to have so many spasms of civic virtue as are now needed to keep our house fairly clean.

THE REPORT ON LIBERIA.

The report of the three commissioners to Liberia, Messrs. Roland P. Falkner, George Sale, and Emmet J. Scott, recently transmitted to Congress by the President, was delayed so long and so unnecessarily in the office of the Secretary of State as to endanger its being acted upon by the present Congress. This we should consider highly unfortunate. The recommendations submitted by Mr. Knox and approved by Mr. Taft ought to be dealt with at the present session. They are clearly set forth and easy to master. All Liberia, moreover, hangs upon the action of this Government. If cable reports are to be trusted, the business of administration is almost at a standstill pending the decision of Congress as to what attitude this country will assume toward the African Republic which represents the only attempt of Americans to colonize on African soil.

Let it be said at once that the commissioners found a much more favorable situation in Liberia than they or the Department of State had been led to expect. Alarmist newspaper reports originating in British circles had given the impression that the lives of foreigners were in danger; and there was actually a move on the part of the British Government to send a regiment to the Liberian capital, Monrovia. The chief difficulties confronting Liberia are from beyond the limits of the Republic. It is menaced by France on one side and Great Britain on the other. The former, says the report, "has based her aggressions on the plea that the territory which she has annexed, and then had ceded to her by treaty, was not effectively occupied by the Liberians, and was therefore subject to acquisition by another Power"—a pleasant little doctrine for one powerful country to lay down to a tiny neighbor. Thanks to it, Liberia, in 1902, lost to France a strip of sixty miles of coast and extensive territories in the interior, and no less than 2,000 square miles in 1907. So far as the English are concerned, the Commission is satisfied that the alarmist reports already mentioned were due to a conspiracy among British subjects in Monrovia, aided by the British officer in charge of the Liberian Frontier Police, to make it appear that the Government of Liberia was tottering to its fall.

So far from this being the case, the Liberian President, in the opinion of the Commission, extricated himself admirably from a trying situation, and the offending British commander, Major Cadell, who had, in violation of law, enlisted seventy-one British subjects in his Frontier Police, was dismissed. It appeared, after he left, that Major Cadell, who actually threatened the Government to which he owed allegiance, had left behind him a very considerable unauthorized debt. In 1904, British forces from Sierra Leone entered a portion of the Liberian territory to pursue hostile tribesmen who were raiding from Liberia into the British possessions. Since then the British have "occupied" this territory, and now refuse to relinquish it until Liberia shall have paid the costs of the British occupation. Says the Commission:

> The British foreign office has protested that Great Britain has no designs on Liberian territory. We find it hard to reconcile this protestation with the acts and attitude of her officials in Sierra Leone and Liberia. Certainly there is no difficulty in understanding Great Britain's declaration that if France is permitted to make successful advances into Liberian territory she will be compelled in her own interests to claim her share. It makes little difference whether Great Britain is the upper or the nether millstone. Liberia is between the two, and it is the conviction of the Commission that unless she has the support of some Power commensurate in strength with Great Britain or France, she will as an independent Power speedily disappear from the map.

So far as internal affairs are concerned, the Commission reports that the police are in good condition, but likely to deteriorate if not soon well officered, preferably by Americans. In the internal administration, the sorest point is the finances. The customs revenue is now collected systematically, but that from internal resources is pitifully small, owing to "crude and casual methods of collection," while expenditures have increased because of praiseworthy efforts to give more and better government to the native tribes in the interior. Lack of skill in estimating receipts and indifference as to the outcome of each fiscal year have resulted in the Republic's living annually beyond its means. Consequently, there is now a considerable floating debt in addition to a domestic debt "equivalent to about one year's revenue of the Republic." The total of both debts is only $1,289,000, but the foreign bondholders have become uneasy, owing to delays in making payments. The judiciary is reported to be honest, but little versed in law. Education is, on the whole, backward, but there are some excellent schools. Good harbors are a pressing need, and good highways even more so, for "the interior of Liberia is as little known to the Liberians themselves as to the world at large." With great possibilities of wealth in her forests, her rubber, palm oil, palm kernels, and pissava fibre, Liberia has "little more than scratched the surface of its soil in a very small portion of its area."

To improve the situation of the Republic, the Commission makes the following recommendations:

> (1.) That the United States extend its aid to Liberia in the prompt settlement of pending boundary disputes.
>
> (2.) That the United States enable Liberia to refund its debt by assuming as a guarantee for the payment of obligations under such arrangement the control and collection of the Liberian customs.
>
> (3.) That the United States lend its assistance to the Liberian government in the reform of its internal finances.
>
> (4.) That the United States lend its aid to Liberia in organizing and drilling an adequate constabulary or frontier police force.
>
> (5.) That the United States establish and maintain a research station in Liberia.
>
> (6.) That the United States reopen the question of establishing a naval coaling station in Liberia.

If Congress approves, Mr. Knox is ready to negotiate for a treaty with Liberia to carry out these objects. The success of our management of the Santo Domingo finances has not made the *Nation* feel more friendly toward the policy of policing other nations. In this case, however, it is indisputable that we have a heavy moral liability, since the Liberian Republic was set on its way by aid from the American Government and people. It is an admirable experiment station for negro self-government, which should not be allowed to fail because of foreign greed and aggression. At least some of the programme proposed should be carried out, even if Congress in its wisdom is opposed to the whole. A moral protectorate is to-day highly desirable.

THE END OF A CHAPTER.

The report is confirmed that Senator Hale, as well as Senator Aldrich, will retire from the Senate at the expiration of the present Congress. Senator Aldrich has been for many years the undisputed leader of the dominant party in the Senate, and has exercised a control of the actions of that body which often seemed unlimited. Next to Senator Aldrich in importance—though at a very long remove—Senator Hale was the only one left of the group of strong men who for years formed the centre of the Republican representation in the Senate. Their disappearance from the Senate Chamber will end the series of losses of veteran Senators of high ability which began with the death of Hoar and has been followed by the deaths of Platt of Connecticut and of Allison, and the retirement of Spooner. In comparison with these the men on whom the leadership of the Senate will now depend are green hands.

Hale and Aldrich are chairmen of the two most important committees of the Senate, Finance and Appropriations. Irrespective of any questions of controversy, there are a thousand matters

to which they have devoted much labor, and which they have handled with ability. In the case of Mr. Hale, there are two subjects on which his individual position was distinctive and which call for particular mention. At the close of the war with Spain, his was one of the few voices raised in the Senate in opposition to the prevailing tendency. While not fighting as Senator Hoar did for the uncompromising assertion of old-time American principles, he did place himself on the side of those who were trying to stem the overwhelming tide of Imperialism. And he has been for years a thorn in the flesh of the big-navy people, his knowledge of naval matters and his membership in the Senate Committee on Naval Affairs giving his position special weight. In general, however, his position was that of one of the managers of the regular organization of the Senate, the right-hand man of Senator Aldrich.

As for Senator Aldrich, after every acknowledgment is made of his ability and his hard work in the carrying on of the necessary business of the Senate, the one fact stands out that he was the living embodiment of that sordid and corrupt system which has left its ineffaceable brand on the history of the Republican party for three decades. Taking its rise in a true national movement based on great ideas of humanity and morality, that party, after completing its immediate mission, went rapidly through all the stages of a strange and complete metamorphosis. After the close of the war, in the Reconstruction years, many a sin of corruption and misgovernment was laid at the party's door; but while public attention was largely centred on these temporary and promiscuous abuses, a profound and lasting change was going on in the very nature of the party. From "the party of moral ideas," from the party of union and freedom and equal rights, it was turned into the party of wealth, of extortion, of intrenched and insolent commercial privilege. And of this régime Mr. Aldrich became in time the very head and front. He is often spoken of as a wonderful master of the tariff question; but the tariff question of which he is a wonderful master is the question how much the American people can be made to stand and deliver to the protected interests without rising in successful revolt. Nor is it only upon the tariff that the Aldrich régime has represented this attitude. Up to a very recent time, every proposition in the United States Senate that was objectionable to the great capitalistic interests was doomed as a matter of course to death in committee.

The close of Senator Aldrich's career will coincide, we confidently believe, with the close of this most unedifying chapter in the history of the Republican party. The signs of impending change have grown more and more impressive with every passing year, every passing month. What was tolerated for years because of the historic past to which the party leaders so long "pointed with pride," what was tolerated for many years afterwards while the country was still in the heyday of a new and dazzling material prosperity, will be tolerated no more. The people will no longer accept big figures of "prosperity" as a substitute for the assurance that government is being carried on by honest means and with the honest purpose of securing to the whole nation the greatest benefits which our natural advantages and the spirit of our people make possible. The growth of the insurgent movement is a manifestation of returning health that must hearten every believer in democratic institutions, and must rejoice particularly every Republican who recalls the days when his party meant something quite different from tariff-worship, and sought objects whose value could not be measured in Wall Street. All signs point to the opening of a new chapter in the party's history; and if that chapter cannot be filled with a record as inspiring as that which filled its early years, every good Republican may hope at least that the party, by a sincere effort to deal wisely with the less inspiriting but more difficult problems of the present day, will free itself from the odium which three decades of money-worship have brought upon it.

A GREAT TEACHER.

It may be said without exaggeration, we believe, that with the death last week of Prof. William Graham Sumner of Yale University, an historic figure in American economic controversy passes from the scene. To the younger generation, whose habitual view of the tariff question is of an artificial system fastened on the country, from the grasp of which it is the country's business cautiously to extricate itself, and whose idea of the gold standard of currency is of a policy so completely settled as to be no longer a matter of controversy, it will not be altogether easy to picture the real achievements of this veteran teacher. Professor Sumner attacked the protective tariff system at a time when protection was a fetich. He preached free trade when assertion of that doctrine was almost equivalent, so far as concerned the feelings of social and business acquaintances, to the preaching of atheism. Not only was free trade, or even the modified propaganda known as tariff reform, regarded by a large and highly respectable part of the community as a gratuitous assault on American institutions, but it was mixed up, in the mind of the same people, with surrender to the political hegemony of England and payment of the Confederate debt.

It was Professor Sumner's notable achievement that he taught his doctrines to his students, in the face of this wall of public prejudice, without equivocation or qualification, and that he set forth the underlying principles with such clearness, sincerity, and force that the complexion of politics was gradually altered from his classroom. The body of new voters who year by year passed from that atmosphere of practical instruction into the domain of every-day life brought with them the clean-cut views and the propagandist zeal which Professor Sumner individually had imparted to them. What the country owed to him, and to the instructors who followed his example in our other colleges, for the community's emancipation, in the early eighties, from the mass of economic superstition which had been darkening the public mind, it would not be easy to overestimate.

In his writings on this subject and on the gold standard, and notably in his teaching of both in the class-room, the great power of Professor Sumner lay in his clear and practical common-sense. It was a favorite saying of the hide-bound high protectionists of the day, especially when they began to discover certain results at the ballot-box, that these young enthusiasts were surrendering their minds to unpractical doctrinaires; to "college professors"—the term was used sarcastically—who knew nothing of the world, of the history of com-

merce or finance, or of modern business conditions, but who spent their days in secluded study of worn-out doctrines of another century. Nothing could have been more absurd as a description of Professor Sumner's economic teaching. He knew the world of business in a far broader way than the narrow conceptions of his critics; he was peculiarly versed in economic history, and nothing so fully explained his influence over readers and pupils as his power of plain and practical illustration of his doctrines by applying them to the industrial conditions of the day. His discussions of the currency, especially at the time when the fiat-money arguments still had a powerful hold on the public mind, were based equally on appeal to history, common-sense, and present-day conditions. His critics did not answer his arguments; they were content, as a rule, with denouncing them.

Probably most people conversant with our political history would say that the influence of Professor Sumner's teachings was most definitely felt in the years between 1880 and 1896. The split in the Democratic party in the last-named year, and its surrender to currency fallacies under the Bryan leadership, gave a much-needed opportunity to the Bourbons of high-protection. Having won the election of 1896 distinctly and exclusively on the sound-currency issue, the Republican leaders hastened, as soon as Congress was convened, to protest that high protection had been endorsed at the polls, and to enact a law with the highest of all protective duties. Helped by a decade of exceptional prosperity, not in the slightest degree caused by the Dingley Tariff, that law remained on the statute-books, and it seemed at times as if, after all, the work in that direction of men like Professor Sumner had been wasted; that the victory for sound money had been won at the expense of a defeat for sound commercial policies. The political history of the past twelve months has shown how mistaken such a judgment would have been. It is in no small measure to the honest and disinterested labors of such economic teachers that we owe the sane and intelligent view which the great majority of the voters manifestly take to-day on the tariff question.

No review of Professor Sumner's career could be complete without a warm and hearty appreciation of the service he rendered to his country during our war with Spain and in the Philippines. Resolutely set against every form of Imperialism and aggression, Professor Sumner again breasted the current of popular feeling, and protested with unfaltering courage against the national obsession. His pamphlet, "The Conquest of the United States by Spain," is unanswerable in its logic, and must remain notable in that literature of patriotic protests against national error, which, through all our history, has so often been justified with the lapse of time. Wedded to the faiths of the fathers of this country, by no specious argument of temporal advantage could he be made blind to the lasting spiritual and moral losses which departure from those traditions involved. He knew no compromise, as he knew no fear. In all serenity he bore the jeers of the mob, unfaltering in his duty and ennobled by that high sense of patriotism which made him the sternest of critics when convinced that his country erred. It is through such characters as Professor Sumner's, and not through money or masonry, that our universities wax great.

DEMOCRACY AND THE COLLEGES.

An incompletely reported alumni-dinner speech of spectacular character is usually a hazardous subject for comment. There is always the danger that the full report would make a very different impression. Nor is that danger wholly absent in the case of President Woodrow Wilson's remarkable address to the Princeton alumni at Pittsburgh on Saturday night; his vision, for instance, of America, if she loses her self-possession, staggering, like France, through fields of blood before she again finds peace and prosperity, may have had a very different effect with its context from what it has when taken by itself. But in order to get at the general spirit of the address it is not necessary to know the exact words used. It was an outburst of protest against abuses and defects that characterize the "rich man's college"; it was a passionate appeal for democratic ideals; it was a danger-signal flashed before the eyes of those who see not the perils that are invited by the self-indulgence and self-complacency of a plutocratic society.

President Wilson does not speak as an outsider; he speaks from the experience and the endeavors of years. He has seen at Princeton the steady growth of luxury, the steady advance of modes of living and habits of social intercourse, reflecting in the little college world the standards of a growingly plutocratic social régime. Where the democratic idea ought to be predominant, he has seen it struggling for survival. His efforts have for years been directed toward restoring the supremacy of the college or university as a whole over the institutions of social cliques and sets. He finds in the dependence of the university on the bounty of wealthy men a factor constantly working to reinforce the tendencies which he deplores. And he courageously lifts up his voice in appeal to the young men who have at heart the true welfare of the university and the true welfare of the country, to aid in bringing about a more wholesome state of things. In this endeavor, he should have the support of all thoughtful college men, rich and poor—of all true Americans.

And yet we cannot let this utterance of President Wilson go without a word of demur. To look for moderation and perfect balance on the part of a man of great oratorical gifts, exhorting his hearers in behalf of a militant reform, would be to expect too much; but it is not any question of mere exaggeration that we here have in mind. It is a fundamental question of point of view. With Mr. Wilson's attitude as regards luxury, snobbery, and the rest of it, we are in the heartiest sympathy; but a college is not confined to the choice of being a paradise of the *jeunesse dorée* on the one hand, and a propaganda of social service on the other. Surely, it is preoccupation with the one object he has immediately in view that must be held accountable for President Wilson's apparently determined ignoring of the claims of culture as such. This is not the first time he has stated his position in this way. In a careful and comprehensive discussion in *Scribner's Magazine* some months ago, of the question: "What is a college for?" one looks in vain for any recognition of the value of culture that is not directly applied to social achievement. If we take him at his word, in measuring the benefits that flow from the existence of our colleges, we must throw out of the reckoning altogether the making of the college men themselves into human beings having

higher, or broader, or more complex, or more remote intellectual interests than would have otherwise been theirs. Time was—and that when boys went to college in homespun and lived on three dollars a week—when this upbuilding of the man himself was regarded as the primary aim of the college; but President Wilson would seem to wish us to believe that we must have done with all that: by its service to the masses of the people and by that alone must the college stand or fall in the modern judgment.

This defect in Mr. Wilson's position is the more to be deplored because we are convinced that it necessarily operates to diminish his chance of influencing opinion and sentiment in the very quarters in which, for his purpose, they most need to be influenced. To denounce the failure of colleges to live up to a fine and generous ideal of culture is one thing; to ignore the existence of such an ideal is quite another. Most of us are not prepared to abandon as idle frippery everything in the social institutions and personal activities of the day except what tends to the solution of the problems of poverty or the improvement of the condition of the less well-to-do masses of the population. Service directed towards these ends is noble, and receives its meed of recognition from rich and poor, learned and simple; and in such service college men have by no means been deficient as compared with other classes of the community. But there are other things in life that are worth while, and that go to the making of a world that has in it beauty and interest and variety and stimulus. Among these is liberal culture; and the liberal culture that men get out of four college years properly employed leavens their whole lives and makes the world a better and brighter place not only for themselves but for others. Indeed, if we are to place ourselves at Mr. Wilson's position, we cannot stop there; there are other fundamental institutions of the existing organization of society that would fare vastly worse under the test that he applies than would the colleges. Judged from the standpoint of a maximum of immediate benefit to the masses—judged without reference to the myriad interlacing influences that flow from them—all the institutions upon which our complex social structure is built would have to go by the board. In spite of Lord Salisbury's dictum of many years ago, we are not all Socialists yet; and those of us who are not must refuse assent to that dogma of service which Mr. Wilson would seem to make the alpha and the omega of his college doctrine.

PHILOSOPHERS AND GUIDES.

Of one thing Mayor Gaynor of New York may be sure. His intimate relations with Epictetus will do him no harm in the eyes of the public. Those of his fellow-citizens to whom the name of the great Stoic was not very familiar before this, will now bestow on Mr. Gaynor the tribute of sincere admiration which the crowd always pays to the respectable and the unknown. Beneath the good-natured banter of the press there is apparent a very distinct appreciation of the qualities of a public official who will read Epictetus when he might put himself full in the front rank of progress by reading "Chantecler." Those who have heard of the old Greek before will be astonished to find him in this year of grace 1910 alive as well as famous. It is delightful to hear that Epictetus as a visible presentment is not confined to the college libraries, and to the department-store shelves during the holiday season, where in gay binding he holds his place at extremely reduced prices with Ruskin's "Sesame and Lilies," Ik Marvel's "Dream Life," Owen Meredith's "Lucile," and Drummond's "Natural Law in the Spiritual World." And when we find the famous old "Encheiridion" really used for a hand-book, as Mr. Gaynor uses Epictetus, for a daily guide, for a refuge from the ills and perplexities of the commonplace world, this too, too solid New York seems to melt away, and we are living with those delightful Rationalists of the eighteenth century who exalted the brotherhood of man and worshipped the ancients.

Very few after-dinner speeches begin nowadays with a quotation from Emerson or Burke or Horace, let alone Boethius or Epictetus. And yet we cannot help thinking that one of the homely sentiments the ancients were so expert in devising would make as good a text as any of the wornout pegs in use among present-day orators. Surely, a sentence from Epictetus or Montaigne or Francis Bacon would be as dignified and as appropriate a beginning as the present rule which requires that the speaker, whether his subject is Gold Production in the United States or the Progress of Woman Suffrage, shall begin by stating that a Methodist bishop was once driving along a country road in the South, when he came upon an old colored man belaboring his mule with a fence rail. It is left to the speaker to effect, as neatly as he can, the transition from the negro and the mule to gold production and woman suffrage. It is true that nearly all of the stories about the negro and the mule, or the two Irishmen who were returning from a funeral, can be traced back to Epictetus, or one of his contemporaries or predecessors. And it is also true that our own imaginative, romantic, verbose, picturesque age wants more "go" and color to its wisdom than we can find in the sententious ancients. Nevertheless, it seems unjust that while we accept the wisdom of the old-timers as it percolates down through the newspaper funny column and the vaudeville stage, we should so utterly forget the men from whom so much of our modern wit comes, or classify them with the old duffers.

They are still sold in goodly quantities, those famous books which parents buy for their children to read, when they should be reading them for their own souls' good—Epictetus and Marcus Aurelius, and, perhaps, even Longinus on the Sublime, Plutarch, Don Quixote, Montaigne, and Francis Bacon. They are sold in goodly quantities, but the elders do not read them and the children either do not read or read and forget before they have become men and women. They gather dust under the common reproach that falls on the classics: highly moral, no doubt, but unreadable, and, for modern purposes, quite useless. And yet there is a tremendous amount of dynamite concealed in those musty and mild-mannered ancients. We live under their influence in the present day, without knowing it. It cannot be mere coincidence that the man who for seven years turned things upside down in Washington, the man who has turned things inside out at Albany, and the man who is busily putting things right side up in New York city, are all readers and students of the ancient moralizers—of Thucydides, Epictetus, and Marcus Aurelius.

To what extent do men nowadays go to a favorite book for help in their everyday work? Everybody to-day has his favorite author; but that only means the author who can best help him through a spring evening at home or a sultry afternoon in a hammock. But are there still books to which men turn for light in perplexity, for solace in adversity, for that counsel and guidance which, unless the tradition of three thousand years lies, has been found by many men in many books? The books, we presume, are still to be had, books of a positive and not a merely negative efficacy, not merely books which take your mind away from something else that one would forget, but carry it to something else that it is good to remember. The books are still here, no doubt; but are the men here to read them? Are Mr. Gaynor and Mr. Hughes merely survivals, or is there still a considerable class of men who can make a daily companion of a single author or a favorite volume? It does not matter so much who the author is. The point is, does modern man look for or tolerate a guide and a source of authority outside of himself and his daily newspaper?

WILLIAM GRAHAM SUMNER.

New Haven, Conn., April 17.

The obituary notices of Professor Sumner, which have appeared during the past week have recalled the Sumner of the seventies and eighties rather than "the aging Titan" of more recent years—Sumner the political economist, rather than Sumner in his latest and ripest period. The tendency in thinking of him is to hark back to his vigor as a champion of free trade and sound money, and if something is said of the latter part of his career, it is likely to have to do with his opposition to the imperialistic movement. Such an attitude is natural enough, for Sumner's activities of thirty years ago were such as to leave a lasting impression upon his friends and an even more persistent recollection, if that were possible, in the minds of those whom he assailed. Upon this period of tremendous vigor, in the class-room, in the faculty councils, in publication, and on the platform, there ensued, in the early nineties, a breakdown in health which coincided with Professor Sumner's withdrawal from the field of political economy, and which, in the eyes of the public, seemed to mark the end of his effective career. In the later nineties, there appeared several volumes on economic subjects which by some were taken to be the signs of the closing up of a life-work.

In a sense this was true, and many of us would be happy enough to conclude a career with the renown which Professor Sumner enjoyed as a political economist. But to him the end of labors in this field merely marked the termination of one more phase of a full life. I have been asked, as a close associate and co-worker with Professor Sumner in the labors of this latter period, to try to afford his admirers and friends some idea of his activities, and of the man himself, as old age crept upon him. Of the labors one might say in general that they were as unremitting as health would allow, whereas before the illness of the early nineties they had been virtually incessant. There seems to have been in this man such intellectual eagerness, such a very mania for discovering the truth, coupled with so strong a power of will, that he wore out a sturdy physique untimely—for, with his strong frame and sound constitution, he might well have lived out the life of a Humboldt. As it was, Professor Sumner retained his large elective courses and ruled them with iron discipline, up to a few years before his retirement in 1909; and to the very end of his active service, he remained an incomparable leader in the college faculty. One who seeks to account for what Yale College has become, and who realizes that such an institution is not built of bricks and stones, but of men, cannot leave out of reckoning the often determinative influence wielded for nearly forty years by Professor Sumner. Even during the last years of his life, he never lost his characteristic power of cutting straight to the core of an issue; nor, indeed, was he deprived, until the latest years, of his joy in battle. He remained in old age the redoubtable debater, confronting opposition with a combination of manner, matter, and method with which few ever successfully coped. But the fight, though Homeric in its tactics, was always fair; Sumner always took his wounds in front, and, as one observer remarked, always shouted, "Look out! I'm coming for you!" before he charged. The greatest immediate loss involved in Professor Sumner's retirement and death, excluding the bereavement of those who loved him, is the loss sustained by the faculty of Yale College. The demonstration of June, 1909, when Yale accorded him the doctorate of laws—when fathers and sons united in cheering the great teacher of two generations—affected him, as he admitted, to tears; and during the succeeding summer he received many letters expressive of gratitude and affection which made him feel, as he said, that the world was using him well.

But I must turn—reluctantly, for the man was ever far more than the work—to the actual labors of these recent years. To judge from many conversations with him, Professor Sumner's interest had always been wider than economics pure and simple, even from the time when he was elected, in 1872, to the chair of "political and social science." At the time of its publication he read Herbert Spencer's "Study of Sociology," and he used frequently to mention the sense of intellectual assent and emancipation which broke over him upon making acquaintance with this and the larger sociological works of Spencer. It was characteristic of Sumner that he must not only know the truth, but pass it on; and, after some conflict with the entrenched conservatism of the day, he finally set before Yale College men the first course in sociology ever presented in an American college curriculum. His interest in the general science—which he called "Science of Society," or "Societology," to distinguish it from what was coming to be taught under the name "sociology"—steadily increased, his second inspiration dating from the reading in the late eighties of Julius Lippert's "Kulturgeschichte." Upon the partial recovery from his breakdown, Sumner ceased to teach political economy to undergraduates—though for some years he had large graduate classes in the United States finance and political history—and developed his classic course in what the students came to call "Sumnerology." In those days a man was hardly supposed to have won a genuine B.A. if he had not had "Billy Sumner." Within a few years the graduate courses in political economy had been superseded by others in the science of society, and Professor Sumner had ceased altogether to teach the specialty of his young manhood and of his prime. Many have regretted this change, but it was inevitable. Sumner's interests outgrew the sub-science and reached out toward the more comprehensive study of the life of society in all its phases, not the economic alone. He was by nature a way-breaker, and then he was beginning to feel what later became a conviction, that economics was slipping away from sound doctrine into the domain of "metaphysics." It is needless to say to any who have known his teachings that he eschewed the latter with all the rigor of which he was master, believing that he himself had suffered much harm from his earlier clerical studies along such lines, and having been, as he phrased it, "engaged in heaving that whole cargo overboard ever since."

During the late nineties we graduate students used to wonder why Sumner did not publish on sociology, although I do not recall that any one of us had the temerity to ask him. But at length one of us found enlightenment for all in an account of an interview in which some breezy reporter had inquired of Sumner what we all should have liked to ask. To the question, "Why

does Professor Sumner not publish?" came the gruff answer, "Because he prefers to correct his own mistakes rather than to have somebody else do it for him"—and we were content to have suppressed our curiosity. As a matter of fact, however, some of us had been taken to Professor Sumner's study and had seen with amazement the serried rows of classified notes on anthropology and the science of society, and we knew what not many outsiders did, that the old-time industry and vigor had not lessened; and we used to believe that if Spencer had had such a collection of materials, the "Principles of Sociology" would have been far more strongly buttressed, and would more nearly have resembled the irresistible "Origin of Species." In the eighties, Sumner had known his Hebrew, Latin, Greek, French, and German; but in these materials was revealed the marvellous fact that, probably after the age of forty-five, he had learned to use readily, not only Danish, Swedish, Dutch, Spanish, Portuguese, and Italian, but also Russian and Polish. Equipped thus for the collection of materials, he had plunged into the field marked off by Tylor, Lubbock, Spencer, and others, and had read an incredible number of books, journals, and other sources. The first public indication of this research, and of the reflection upon its results, was the appearance, in 1907, of "Folkways: A Study of the Sociological Importance of Usages, Manners, Customs, Mores, and Morals." I cannot go into this publication except to say, first, that (as bearing upon what immediately precedes) it astonished scholars by the range of its knowledge. The bibliography, which is not at all a catalogue of all the author has ever read, or has had read for him, covers fifteen closely printed pages, and yet includes scarcely any titles of systematic works, and virtually no references to the author's extensive economic reading. To his fellow-scientists the "Folkways" revealed the fact that Sumner's scholarly labors, under conditions of ill health and of declining strength, had in later years even surpassed those of his prime. Further, it is thought by many that the "Folkways" represents a very fundamental step in the development of any sound science of society. Perhaps I may be permitted to quote from a characterization which was made some months ago (*Yale Review*, August, 1908, pp. 134-135) by the present writer, and with which Professor Sumner seemed to be pleased:

> This is a book, which, as it seems to the writer, Charles Darwin would have written if he could. It is patent to the reader of "The Descent of Man" that, whatever the cause, for once in his life Darwin has been led to essay waters beyond his depth; chapters iv and v of the "Descent" do not sound at all like Darwin. Because, in the interest of completeness, he was led or persuaded to attempt the treatment of man's social qualities and institutions, or for some other reasons, Darwin in these chapters undertook to discuss such topics as the origin of the moral sentiments. This part of the "Descent" had better have been left unwritten, for, in default of his usual mountains of data from which to draw irrefutable inductions, the great scientist was led to wander hopelessly among the unfamiliar and unfathomable quicksands of the metaphysical and intuitional. In so doing he presents but a sorry aspect to his admirers.
>
> The treatment of the "mores" by Professor Sumner is the sort of strong and ballasted product that Darwin delighted in. Moreover, it is a treatment which constitutes a distinct and characteristic amplification of the evolutionary theory. The folkways are shown to be adaptive to environment; it is plain that, in the long run, the fittest ways must survive. It admits of no doubt in the present writer's mind that the matter of this book fits into the "Descent of Man," after chapter iii, in a way more acceptable to Darwinian ideas than the work of Spencer possibly could be. Sumner's cast of mind is Darwinian rather than Spencerian; he has no synthetic philosophy to establish. His "Folkways" clarifies the matter of social evolution in a manner calculated to give his work place as truly supplementary to that of Darwin.

To understand the bearing of this book on the treatise covering the "Science of Society" (of which Professor Sumner speaks as his next task, in the preface to the "Folkways"), one must realize that the idea of the Folkways or mores was one which he came to regard as entirely fundamental to any science of society. He had written for several years on his projected general treatise on the "Science of Society" before he came to what he called the "section on the mores"; and this section it was which developed into a separate volume ("Folkways") to precede the major treatise. It is entirely regrettable that the latter could not have been completed; but, if a choice could have been made, it would have been better that the "Folkways" should receive the preference.

The most attractive and the grandest aspect of Sumner's latter years, though I have inevitably suggested it, remains. It is the man's character. He was a Roman soul among us; he lived before his students and colleagues as the embodiment of honesty and fearlessness. He was to the end the uncompromising foe of hypocrisy, sham, ostentation, and weak sentiment—which he curtly denominated "gush." I know that some will think I exaggerate in my friendship and reverence for the dead, when I say that he was in character an humble man. He seemed at all times positive and even intellectually arrogant, but his personal opinion of his own services and work always reminded me of the self-depreciatory attitude of Darwin. In personal relations he was unassuming, helpful, excessively grateful for small services rendered, but beset by the fear that he would cause anybody else some trouble. He was ready at all times with kindly counsel and sympathy—and the counsel was that of deep wisdom and the sympathy that of a warm heart. I have somewhat enlarged upon this side of his nature, because in appearance and to slight acquaintance he was stern, often gruff, seemingly without human feeling. But this was not the real man. He was a strong hater and a strong lover, as must happen where the essence of one's character is strength.

I cannot conclude this notice without referring to one of the most marked characteristics of the man as many of us have known him. Of late years he had been accustomed to walk slowly out the avenue from his house to East Rock Park, where he used to sit upon one of the benches in a secluded spot overlooking the little tidal river; and he was glad to have companionship in these excursions. But on the way out and back, I think it is safe to say, he seldom or never passed a little child, or, in any case, a baby, no matter how forlorn its estate, without some friendly words or other kindly demonstration. Some of us used to believe that he called to see the children rather than ourselves. And I do not remember to have seen a child afraid of him, despite the fact that his rugged and deep-lined countenance used to inspire not a few light-minded college seniors with the notion that it was best to keep at a safe distance.

It was in characteristic response to the call of duty that Professor Sumner's last efforts and energy were expended. He was scheduled for the president's address of the American Sociological Society; and he dragged himself off to New York, ill and weak, but as determined as ever, in the heavy snowstorm of Monday, December 27, with his manuscript carefully prepared, typewritten and corrected, in his bag. He struggled up nearly to the battle-line prepared to discharge his duty, as of old, but there was no strength remaining. "How characteristic of Sumner!" was the common remark at the news of his fall. One could scarcely wish for a more graphic description of his character and career.

ALBERT G. KELLER.

NEWS FOR BIBLIOPHILES.

The auction of the Amor L. Hollingsworth library in Boston on April 12, 13, and 14 was very successful, the total of the three days' sale being $49,000. Record prices were paid for nearly all the items of Americana, and there was good competition for the other books, especially for the fine bindings. The highest price of the sale was $1,130, paid for the Massachusetts Laws of 1699, with the supplements to 1712. This was purchased by the Law Library of Harvard. A fine copy, in the original sheep binding as issued, of Captain Bernard Ro-

mans's "History of East and West Florida," New York, 1775, brought $810. The highest previous record at auction is $410. Capt. John Mason's "History of the Pequot War," written in 1637, but not printed until 1736, brought $750. This identical copy was bought at auction for Mr. Hollingsworth in 1901 for $445. An Almanac for 1667 printed in Cambridge by Samuel Green brought $385. This copy had appeared twice before in the same rooms, bringing $155 in 1901 and $275 in 1904. Lescarbot's "Histoire de la Nouvelle France" (1609), the first edition, brought the record price of $410.

Wilberforce Eames has been for years collecting books relating to the American Indians, and the sale of his library, announced to take place several years ago, has been eagerly awaited. He has recently disposed of the major portion to the New York Public Library, retaining, we understand, only such books as the Library already possessed. The first portion of this residuum is to be sold ("absolutely without reserve," as the catalogue states) by the Anderson Auction Co., on April 26, afternoon and evening. A few duplicates from the Public Library are included, the most important being a Columbus Letter, one of the original Latin plaquettes, four leaves, small quarto, the second of two editions printed by Stephen Plannck in Rome in 1493. These 1493 editions of the Columbus Letter are at once the joy and the despair of the collector of Americana. This was Bolton Corney's copy, sold with his library in 1871. It was later acquired from Quaritch by William Waldorf Astor, and was presented by him to the Astor Library the next year. Anderson's cataloguer says that only fourteen copies are known, but twenty or twenty-one would be more accurate. The following list of copies may be of interest:

British Museum. Two copies.
Bibliothèque Sainte-Geneviève, Paris.
Commerzbibliothek, Hamburg.
Biblioteca Riccardiana, Florence.
Biblioteca Nazionale, Naples.
Biblioteca Trivulziana, Milan.
Biblioteca Communale, Fermo.
John Carter Brown Library, Providence.
New York Public Library, Lenox collection.
New York Public Library, Astor collection. The present copy.
Library of the late Baron James Edouard de Rothschild, Paris.
Library of the Duc d'Aumale, Chantilly.
Library of the late Henry Huth, London.
Library of the late E. Dwight Church, New York.
Library of the late Robert Hoe, New York.
Library of Edward E. Ayer, Chicago.

The Church copy was the Barlow and Ives copy, the only one ever sold at auction in America, bringing $2,200 at the Barlow sale in 1890 and $1,600 at the Ives sale in 1891. The Hoe copy (formerly Kalbfleisch's) and the Ayer are probably two out of the five following, which have been sold at public sale abroad in the last twenty-five years, but the present location of which cannot now be traced:

Dr. Court, sold in Paris, May, 1884.
Lord Crawford, sold in London, June, 1887.
Baron Seillière, sold in Paris, May, 1890.
Rev. W. E. Buckley, sold in London, February, 1893.
J. B. Inglis, sold in London, June, 1900.

No copy seems to have come upon the market within the last ten years.

Another great rarity in the Eames collection is George Alsop's "Character of the Province of Maryland" (1666), with the very rare frontispiece, though the last four lines of verse below the portrait are in facsimile.

On April 28 and 29 the Anderson Auction Co. will sell the first part of the library of the late Hon. Charles H. Truax. Thirteen specimens from the Aldine press (1495-1524); three books from Bedoni's press at Parma (1791-'93); several illuminated manuscripts; publications of the Bibliophile Society and the Dunlap Society; a collection of books on old silver; Gower's "Confessio Amantis" (1554), and a set of Brunet's "Manuel du libraire," the last edition (1860-80), are included.

On April 26, 27, and 28 the Merwin-Clayton Sales Co. will sell the first part of the library of William A. Gramer. Unusual series of the first editions of several modern authors, such as Bliss Carman, Gilbert K. Chesterton, Joseph Conrad, John Davidson, George Gissing, Maurice Hewlett, George Moore, Stephen Phillips, and George Bernard Shaw, are the most notable of the sale. "La Cuisine créole," a New Orleans cook-book, and an "Historical Sketch Book and Guide to New Orleans and Environs," both published in New York by Will H. Coleman in 1885, are offered as unidentified books by Lafcadio Hearn.

On April 26 to 29 Libbie & Co. in Boston will sell a large library belonging to a Boston collector, whose name is not made public. New England town histories and genealogies; books on the Revolution; a large collection of Napoleon Memoirs; first editions of Andrew Lang and other English authors, and books in many departments make up the 12,000 volumes and over. An original impression of Paul Revere's famous print, "The Bloody Massacre, perpetrated on King Street, Boston, March 5, 1770," with contemporary note that it was colored by Christian Remick, is the most valuable single lot of the sale.

On May 4 Sotheby, Wilkinson & Hodge, in London, will sell a remarkable collection of manuscripts. Among the documents are full autograph letters of Mary Tudor, Mary Queen of Scots, Queen Elizabeth, Charles I, Charles II, and others; a series of thirty-four letters (partly signed) of Philip II of Spain; a nearly complete series of autographs of the Popes, beginning with Martin V (1428), and coming down to the late Leo XIII; a set of letters or documents written or signed by the French Sovereigns, from Louis XI to Napoleon, and other notable collections are included.

On May 9 to 12 the library of the late F. Marion Crawford will be sold by the same house. It is a working library without rarities. With it will be sold the library of Alderman Joseph Thompson. A first edition of Milton's "Areopagitica" (1644) and other seventeenth-century tracts, are included.

Correspondence.

FROM THOREAU TO CONFUCIUS, VIA WASHINGTON CO., VIRGINIA.

To the Editor of The Nation:

Sir: Sixteen years ago, in preparing an Historical Society paper, I made use of this quotation: "The virtues of a superior man are like the wind; the virtues of a common man are like the grass: the grass, when the wind passes over it, bends." I had come across it in reading Thoreau, and, struck by its mystic Eastern turn, I appropriated it—a novel, as well as a striking, figure of speech. This was in 1894. Thirteen years later, I had occasion to deliver an address on Gen. Lee, at Lexington, Va., and I again made use of the simile; but, not having made any note of the source whence I drew, I simply quoted from my own earlier production, giving it no further thought. In February, following, to my surprise, I received a letter from Abingdon, Va., signed R. V. Lancaster, saying that the phrase had been quoted by Professor Hogue of Washington & Lee University, in an account of my address, and attributed there to a "disciple of Emerson." Mr. Lancaster added, "now this idea in almost the exact form given is found in the Analects of Confucius."

More than a good deal taken aback by this discovery of my own unconscious erudition, I at once wrote to Mr. Lancaster, frankly expressing my surprise at the information given me, and my own surmise that the figure, if it had not actually originated with Thoreau, went back at furthest only to Emerson; and I went on to express the curiosity I felt to learn more of it. Mr. Lancaster, who had, it seems, been for fifteen years a missionary to China, replied that the Analects contained the following: "A certain ruler asks: 'What do you say to killing the unprincipled for the good of the principled?' Confucius replied: 'Sir, in carrying on your government why should you use killing at all? Let your evinced desire be for what is good, and the people will be good. . . . The relation between superiors and inferiors is like that between the wind and the grass; when the wind blows the grass must bend.'"

In a volume entitled "The Sayings of Confucius" (in the Wisdom of the East Series, recently published by Dutton), I find my quotation in two places (pp. 32, 42), where it appears as a reply made by Confucius to a question on government by Chi K'ans Tzu, "Ought not I to cut off the lawless in order to establish law and order? What do you think?" The reply is in nearly the same words as those used by Mr. Lancaster.

As my curiosity was now thoroughly excited, I at once set to work to find where in Thoreau's writings—for in my recollection the quotation was inseparably associated with Thoreau—the extract from Confucius could be found. The editor of the definitive edition of Thoreau was unable to aid me; and, as time passed, I despaired of ever locating my elusive quotation. Chancing, however, one day across Mr. F. B. Sanborn, on a railway train, the conversation drifted from one topic to another, and finally to Thoreau. It occurred to me to mention my quotation. Mr. Sanborn, as is pretty generally known, is a sort of walking encyclopædia of odds and ends of miscellaneous information, and he now justified his reputation, telling me that I would find what I sought at the close of a chapter in Thoreau's "Walden," and that Thoreau there stated that the quotation was from a Chinese philosopher, mentioning no name. I found it at the close of Chapter VIII; but Thoreau had not in any way indicated the source whence he drew.

I presume I do not stand alone in having, on more than one occasion, lost sleep over

the effort to place some quotation which had stuck, so to speak, in memory's crop, and in the placing of which no collection of quotations offered any assistance or supplied a clue. In the present case I hold it to have been a notable coincidence that a poetical figure of speech found in Thoreau's works, and assumed to be taken from those of Emerson, should be thus correctly placed as attributable to Confucius by a modest Presbyterian clergyman, living in an obscure village nestled in the Virginia Alleghanies; he having a knowledge of the writings of Confucius solely as he had studied them in the Chinese tongue. Such a coincidence seems to merit mention among the Curiosities of Literature.

CHARLES FRANCIS ADAMS.

Washington, D. C., April 14.

THE HETCH HETCHY.

TO THE EDITOR OF THE NATION:

SIR: In the Hetch Hetchy controversy new light has suddenly appeared and completely altered the aspect. It has been assumed, by both sides, that the area in the Yosemite National Park which has been conceded to San Francisco, Lake Eleanor and Cherry Creek, was insufficient to give her the amount of water to which she is entitled, and therefore she demands Hetch Hetchy also. This impression is gained by the wording of the Garfield permit. As a matter of fact, this area yields twice the amount of water which is the share of San Francisco, and she will be compelled to release one-half of it to the irrigationists. Taking her share in her own territory, she is not entitled to a gallon of the main flow of the Tuolumne River, passing through Hetch Hetchy.

The irrigationists have a prior right to 1,500,000,000 gallons a day; the remaining 200,000,000 gallons a day, or 13 per cent. of the total, is the share of San Francisco. The total drainage area of the Tuolumne basis is 639 square miles. Of this total Lake Eleanor has 84 square miles, or 13 per cent. Cherry Creek drains 103 square miles, or 16 per cent. of the total. Therefore, the two combined, which is the territory conceded to San Francisco, take up 29 per cent. of the Tuolumne drainage. Thus it appears that Lake Eleanor alone is all that San Francisco is entitled to. The Cherry Creek supply and the flow of the main Tuolumne River belong to the irrigation districts by right of prior location.

This estimate is based on the assumption that precipitation of moisture is uniform throughout the entire Tuolumne basin. In fact, however, precipitation is heavier in the norther section, where are Cherry Creek and Lake Eleanor, than in the more southerly part.

In the matter of storage, Lake Eleanor, which San Francisco is required to develop to its greatest capacity, will make an enormous reservoir. And there are several sites above which can be utilized. On Cherry Creek, Cherry Valley can be developed into a reservoir, nearly as large as that at Lake Eleanor, and there are also a number of good sites farther up stream. Furthermore, it is generally understood that San Francisco intends to take over the enormous storage reservoirs of the water company, which now supplies the city. It, therefore, appears that, in what has been given her, she has her water and ample storage for it.

This new information should settle the matter, so far as honest people are concerned. But there are a few dishonest men, who are demanding the Hetch Hetchy, and who have been maturing in secret a plot so atrocious that they have not as yet dared to whisper it in public. By turning the Hetch Hetchy into a reservoir they wish to seat San Francisco on the throat of the irrigationists, and lay the legal foundation now for raising the claim, when more than 200,000,000 gallons a day are needed, that municipal use of water is paramount to its use for irrigation, and thus rob the irrigationists of their supply, and convert a great area of rich valley, now rapidly developing, into a parched and desert waste, scattered with the ruins of deserted homes. With cold-blooded villany, they are planning to do this, knowing that an abundance of water for San Francisco can be had from other sources.

GEORGE EDWARDS.

Berkeley, Cal., April 9.

THE COAL SUPPLY.

TO THE EDITOR OF THE NATION:

SIR: In your issue of April 14 Prof. William H. Hobbs crowds into a single paragraph so many misstatements of what might be easily verified facts that a correction should be filed at once.

As joint authors of the estimates of coal supply and exhaustion in the United States, it is but fair that we should be accorded the right to have our figures correctly reported. Professor Hobbs states in his communication:

> At the recent Minnesota State Conservation Convention, the Secretary of the Interior of the United States, in an address the effect of which could only be to discourage conservation of natural resources, is reported to have stated that not more than four-tenths of one per cent. of the total coal supply of the world has yet been mined, and that the supply is sufficient to last 7,000 years. It would be interesting to know upon whose computations these figures are based, since the estimates of the experts of the United States Geological Survey have placed the proportion of the fuel now unmined at from 40 to 70 per cent. of the total original supply, and have predicted complete exhaustion of the mines in from 107 to 120 years.

The Secretary of the Interior, Mr. Ballinger, in his address above referred to, said:

> According to the production of coal in the United States at the close of 1908, only four-tenths of one per cent. of the original supply of coal has been exhausted, leaving as the apparent supply still available 99.6 per cent. of the original supply, or coal enough to last, as some claim, for a period of 7,000 years.

In making this statement the Secretary of the Interior is in exact accord with the estimates which have been made by us for the Geological Survey. These estimates were published in the report of the National Conservation Commission, and in somewhat greater detail in the reports of the Geological Survey on the production of coal in 1907 and 1908. In the report for 1908 the latest figures covering the coal supply and exhaustion are given. On page 28 the following statement occurs:

> The total production of coal in the United States at the close of 1908 was 7,280,940,265 short tons, which, including the waste involved in the mining and preparation, represented an exhaustion of 11,870,049,900 tons, leaving as the apparent supply still available 3,064,334,011,000 tons, or 99.6 per cent. of the original supply; that is to say, up to the beginning of 1909 only 0.4 of 1 per cent. of the original supply of coal has been exhausted. The quantity of coal still available at the close of 1908 was 7,369 times the production in that year, and 4,913 times the exhaustion represented by that production.

The Secretary of the Interior simply quoted from the published reports of the Geological Survey, and it is difficult to understand how Professor Hobbs arrives at the conclusion that there has been "an invasion by political influence of the freedom and independence of bureaus of scientific inquiry." The first estimates of supply and exhaustion were published in connection with the United States coal fields map issued in May, 1908, nearly two years ago. It should seem that this answers Professor Hobbs's suggestion that it would be interesting to know upon whose computations these figures (those quoted by the Secretary of the Interior) are based. For the sake of scientific exactness Professor Hobbs is advised that the Secretary of the Interior in his address did not refer to the coal supply of the world, but to that of the United States alone. The percentage of the exhaustion of the world's supply, however, is not materially different from that of the United States, as it has been estimated by Mr. Alfred H. Brooks that 0.8 of one per cent. of the entire world's supply has been exhausted. Professor Hobbs apparently attempts to quote us as predicting the complete exhaustion of the coal supply in from 107 to 120 years. It has been stated, and it is true, that if the rate of increase in coal production which has obtained during the past fifty years continue, the supply of the easily accessible and available coal would be exhausted by the middle of the next century. This has also been stated in our official reports, all of which were published before Mr. Ballinger became Secretary of the Interior.

Professor Hobbs further states that "Cabinet officials have not heretofore indulged in such grotesquely inaccurate statements of scientific subjects." In this case the "grotesquely inaccurate statements" should not be charged to a Cabinet official. They were given to the public, not "by one of the great scientific bureaus of the government, under protest," but have been published in carefully prepared official reports and stand on their merits.

Wide circulation has not been given to the report of the National Conservation Commission, but the contributions by the members of the United States Geological Survey have been made available through Bulletin No. 394, which Professor Hobbs doubtless has in his library.

We disclaim for ourselves and for our associates having made any estimate "that the proportion of fuel now unmined is from 40 to 70 per cent. of the total original supply." As above stated, the proportion of the quantity unmined is 99.6 per cent. of the original supply.

As stated by Mr. Alfred H. Brooks, in his testimony before the Ballinger-Pinchot investigating committee, any one is at liberty to base his estimates of duration of the coal supply anywhere he pleases between 150 years and 5,000 years.

In commenting upon the influences which might affect the coal production of the future, we concluded our statement to the Conservation Committee on the duration of the coal supply with the following:

With so many indeterminate factors whose importance is realized, but cannot be measured, prophecy must possess a questionable value.

M. R. Campbell,
Geologist in Charge of the Economic Geology of Coal.

E. W. Parker,
Statistician in Charge, Division of Mineral Resources.

Washington, D. C., April 15.

THE NEW YORK CITY HALL.

To the Editor of The Nation:

Sir: I note your not overcharged remarks in deprecation of the reprehensible proposition to degrade our admirable City Hall into "no more than a stepping-block to the [contemplated new] Court House" so sorely needed—but by no means in the City Hall Park—for our ever-growing city.

As the secretary for thirty consecutive years of the New York Chapter of the American Institute of Architects, and frequently, at intervals during that period, also secretary—for some ten years in the aggregate—of the Institute itself, and thus in close and recurrent relations with most of our prominent architects, I can vouch for the fact that this consummate example of the Renaissance school, the City Hall of our financial metropolis, is accepted as such by the whole architectural profession—*sensu bono*, of course; for, as in all professions, that of architecture has its share of members who are much more devoted to commercial and self-seeking than to ethical and public-spirited considerations, and whose interest in procuring, without any inconvenient scruples, a new commission, is much keener than in preserving the integrity and the prestige of a noble output of their art.

Several times I was, along with two or three of the most distinguished practitioners of New York, placed by the New York Chapter on committees to plead with the municipal authorities against making any change whatever in the exterior of the City Hall, or permitting any further encroachment (far too much having already been granted) on the park surrounding it. On another occasion, at the request of and in company with the late Hon. Andrew H. Green, the "Father of Greater New York," I gave the then Mayor of the city what I thought, and still think, good reasons for advocating the use of the whole length of the north side of Chambers Street, between Broadway and Centre Street, for a new municipal building to meet and complement the judicial, legislative, and postal requirements of the city and County of New York.

Time and further observation have confirmed me in this opinion, and have moreover convinced me that not only should this strip be acquired by the city for the governmental accommodations which have become such a serious desideratum, but that the whole block bounded by Chambers Street, Broadway, Duane Street, and Centre Street should be secured for its present and future needs, the existing Court House and Post Office demolished, and their sites restored to the park for additional breathing and recreative area, in behalf of the neighborhood's congested population.

Literature.

MEXICO.

Porfirio Diaz, President of Mexico, the Master Builder of a Great Commonwealth. By José F. Godoy. With 60 illustrations, maps, and diagrams. New York: G. P. Putnam's Sons. $2.

Mexico: Its Ancient and Modern Civilisation, History, and Political Conditions, Topography and Natural Resources, Industries and General Development. By C. Reginald Enock, F.R.G.S. With an Introduction by Martin Hume, M.A. With a map and 75 illustrations. New York: Charles Scribner's Sons. $3 net.

Mexico, the Wonderland of the South. By W. E. Carson. Illustrated. New York: The Macmillan Co. $2.25 net.

On the Mexican Highlands, with a Passing Glimpse of Cuba. By William Seymour Edwards. Second edition. Cincinnati: Jennings & Graham. $1.50.

Less than two years ago a review of Martin's "Mexico of the Twentieth Century," which appeared in the *Geographical Journal*, closed with the significant words: "There is still room for a good, all-round book on Mexico." As the review was signed with the initials of Alfred P. Maudslay, the highest English authority on Mexican history and archæology, the remark carried great weight. In fact, it seems to have attracted a considerable amount of emulation, for since then at least a dozen books have been published in English which deal with the whole or a part of Mexico. A more obvious reason for this literary activity is that Mexico is soon to celebrate the one hundredth anniversary of her independence. Furthermore, next July marks the conclusion of President Diaz's seventh administration. Last year there seemed to be some doubt whether he would accept the duties of an eighth term. All doubts have now been dispelled, and it is taken for granted that in his eightieth year he will be unanimously reëlected for the coming six-year period.

Accordingly, the publication of a semi-official biography of that distinguished ruler by a well-known Mexican diplomat, would seem to be a matter of no little public interest. The reader soon learns, however, that Mr. Godoy has taken his text from the last verse of the second chapter of Mr. Root's speeches to the Mexicans in Mexico: "I look at President Diaz, the President of Mexico, as one of the greatest men to be held up for the hero-worship of mankind." And Mr. Godoy proceeds to hold him up for our worshipful admiration. But as this has already been done several times, one need not expect to find here any new light on the "Moses and Joshua of his people." In fact, there is no evidence of any real insight into affairs, and only the briefest and most casual mention is made of the actual steps by which Mexico has achieved her present enviable position through the skill of her great President. To be sure, there are quotations from the closing paragraphs of various Presidential messages sent to the Mexican Congress at the close of successive administrations. But those aspects of his government which have of late received so much criticism are absolutely ignored. The following sentence is characteristic of the book:

> The total loss of the crops, the high rate of exchange due to the depreciation of silver, and the economic crisis which then ensued, brought about a reduction in the revenues of the government; but President Diaz, acting with foresight, adopted measures which brought about the satisfactory result of increasing the permanent revenues of the government (p. 53).

Marvellous! But how did he do it? The curiosity aroused by such a miracle of statecraft is not gratified by the presentation of any details. The "measures" in question, and all other specific acts which might arouse suspicion, have been passed over in silence. Apparently, President Diaz never committed an error of judgment. Praise and adulation continue in increasing crescendo until chapter xv is reached, when for the next seventy pages we have a pyrotechnical display that, for interest and entertainment, can only be compared to a scrapbook of obituary notices prepared by a clipping bureau upon the death of some distinguished philanthropist. In the present case, however, the one hundred and seven eulogies are actually signed by "prominent men," Senators, Representatives, college presidents, and diplomats. While many of them admit that they have no personal knowledge of the subject about which they are writing, a few could, if they would, agree with Mr. Carnegie that "one of the most pleasing recollections of my life is that I was received in the City of Mexico in special audience by His Excellency, President Diaz." It is a pity that Mexico's able Executive, whose remarkable achievements cannot be gainsaid, should have allowed his recent chargé d'affaires at Washington to cloud his reputation with such a heavy volume of praise. Too much incense only makes the worshippers sneeze.

Mr. Enock's "Mexico" is well worth acquiring. As was to be expected from the character of its predecessors in the South American Series, its space has been judiciously divided between history and present conditions. Archæology, ethnology, history, politics, natural resources, mineral wealth, and commerce

receive each due consideration. In following the profession of a civil and mining engineer, Mr. Enock has seen many parts of the land which are unfamiliar to the general reader; at the same time, he has not yielded to the temptation to neglect the essentials. His style has improved much since his first book, "The Andes and the Amazon," was published a few years ago. Yet he still allows himself too frequently the privilege of moralizing, and he has a dangerous tendency to generalize with regard to Latin America. It is true that his knowledge of both Mexico and Peru is accurate, but it frequently leads him to draw erroneous conclusions about the other countries. Notwithstanding these faults, he has produced a most satisfactory handbook. It is not so delightful as Flandrau's "Viva Mexico," the best appreciation of Mexican character that has appeared in English; and as a guidebook and *vade mecum* for travellers, it is not the equal of Terry's "Mexico." Nor does it contain so detailed an account of present conditions as Martin's two volumes; but it is on the whole more the kind of book for which the average reader is looking and in which he can learn the characteristics of Mexican life and travel, and the desired facts in regard to the evolution of modern Mexico. It is the best of the books that have appeared quite recently on Mexico. Furthermore, it is a relief to find that Mr. Enock has not found it necessary to indulge in that fulsome flattery of Mexico's greatest President which has been so marked a feature of many recent books besides Mr. Godoy's. It should also be said that he does not descend to that ignorant abuse of the sterner measures of Diaz's administration which has become the fashion in certain other quarters.

At the first glance at its title, Mr. Carson's "Mexico" would appear to be another attempt at "a good, all-round book on Mexico." But it turns out on examination to be merely the usual result of a literary traveller's four months' wintering in a semi-tropical land. Mr. Carson is an omnivorous gatherer of facts. His first two days on Mexican soil yielded him the material for at least fifty closely printed pages! In his journeyings he covered the ground that most hasty Mexican travellers are thoroughly familiar with. As Mr. Beebe said five years ago in his charming "Two Bird Lovers in Mexico," "The strangeness of the Mexicans and their dress, their houses, streets, and markets were of never-failing interest; but well-written accounts of these may be found in half-a-hundred volumes." Unlike Mr. Kirkman, whose artistic "Mexican Trails" was recently reviewed in these columns (November 25, 1909), Mr. Carson rarely left the beaten trail, and knows almost nothing of the life of Mexico away from the railway. Some of his remarks are amusingly naïve, such as: "Few Mexican women are domesticated" (p. 125); "no foreigner, unless he be associated with diplomacy, is likely to have any chance of studying and judging the Mexican women" (p. 159); "fevers and malaria [!] are certain to result from exposure to rains or the intense heat of the midday sun" (p. 383). There is a good deal of tiresome repetition on the slowness of the train service, the charming views, and the bad Americans that the author met with everywhere. Perhaps the most interesting feature of the book is the evidence it gives of the prevalence of Americans in nearly every Mexican city of any importance.

Ten years ago William Seymour Edwards made a trip from his home in West Virginia to Mexico City by rail, returning by way of Havana and Florida. Although he spent but a month in Mexico, his time was well occupied. His observations are keen yet sympathetic, and his style is intimate and friendly without any pedantry or padding. Unlike Mr. Carson, Mr. Edwards tells his readers exactly the length of time spent in each place and faithfully records his experiences in an out-of-the-way region without finding it necessary to draw largely on the works of his predecessors. In fact, he admits in so many words that he is afraid of retelling his readers what they already know. Therein lies the secret of his charm and the reason for the success of his book, a second edition of which has just appeared, the first edition having been published in 1906.

CURRENT FICTION.

Lady Merton, Colonist. By Mrs. Humphry Ward. New York. Doubleday, Page & Co.

In the light of this pleasant story, "Marriage à la Mode" may almost be forgotten. The acerbity, the indignant insularity, which distinguished that tale, are here abandoned for an almost voluptuous worship of the spirit of the new world. It is, to be sure, a new world over which, however precariously, the Union Jack still floats. Mrs. Ward's visit to Canada evidently left her in a much more comfortable mood than her sojourn in "the States." Indications are not lacking of a sharp line drawn by the chronicler between the Canadian and his cousin across the border. The latter is a person to be kept in his place if possible, and if not, to be converted with all expedition. There is a French Canadian in this story who has a chronic fear of the "American invasion," especially in British Columbia—a "peaceful penetration, both of men and capital, going on so rapidly that a movement for annexation, were it once started in certain districts of Canada, might be irresistible." But the Britons have no such fear. The calamity might have happened, they grant, before the development of the Canadian Pacific, but now America merely adds her quota to the incoming torrent of aliens eager to be naturalized, to have their part in the development of a new country—under the Crown. "We come after America—we climb on her great shoulders to see the way!" cries Lady Elizabeth. And an American who agrees that Canada is likely to remain Canada adds quietly, "I dare say we have missed our bargain. What matter! Our own chunk is as big as we can chew."

That beautiful English widow, Lady Merton, falls in love with Canada partly because the bigness of the chunk excites her fancy. She thrills at the spectacle of England dealing so rapidly and capably with the monster. "Twelve years ago even—in all this Northwest—practically nothing. And then God said, 'Let there be a nation!'—and there was a nation—in a night and a morning." In this intense ejaculatory strain does the visiting lady discourse to her Canadian hosts, to her brother, to the man who has followed her from England in order to make love to her. And, of course, it is a Canadian who becomes the embodiment of her dream of greatness, and the Englishman is sent about his business; and after proper emphasis upon the obstacle to their union, Lady Elizabeth and her Anderson take up together the life of the pioneer. The machinery of adverse condition and incident is rather crude and melodramatic, and cheapens the whole performance. Otherwise the story is pleasant, emotional, feminine, characteristic of Mrs. Ward in her later and less robust mood.

Nathan Burke. By Mary S. Watts. New York: The Macmillan Co.

This story is of a quality so unusual as fairly to shake our faith that Mr. Churchill's "A Modern Chronicle" will prove the most remarkable American novel of the season. It does extremely well what so many of our story-tellers (Mr. Churchill included) have so often done ill or failed to do altogether. It belongs, that is, to the not very promising category of "historical romance." Nominally, it is the autobiography of Gen. Nathan Burke, who won popular fame in the Mexican war as the "Hero of Chapultepec," and led thereafter an honorable life as a prominent citizen and member of the Ohio bar till his death from heart-failure in the year 1889. The preliminary rules of this sort of pseudo-autobiography are observed with more than ordinary care. The reader is spared no assurances in the author's Introduction that her part in the narrative is a slight one; and if it were not for the fact that the title-page is that of a novel, the credulous reader might go some distance with the author without suspecting her of being

more than the editor she professes herself. We own our ignorance as to whether such a person as Nathan Burke ever existed in the flesh; but we are reasonably sure that the Nathan Burke of this chronicle never drew breath outside of it. He belongs to the fabulous race of Newcomes, Dombeys, Uncle Tobies, Col. Carters, *et al.*—a glorious company, to be sure.

The narrative is supposed to have been interrupted by the General's death, and is not caried beyond the year 1852. He was still a very young man; but the romantic part of his story was told. He had come back from the wars—for good, so far as we know—had married and settled down with the happiest prospects for the ever after. In short, it is the experience of an American youth in the thirties and forties which the novelist has concerned herself with. That was precisely the period which it is hardest for the present generation to visualize—the age of pantalets, eloquence, and "Martin Chuzzlewit." The present story brings it to life again as if by a spontaneous act of creation. The atmosphere of the time, social and political, is revealed by a vast number of minute touches; and the little group of persons in the foreground have their typical as well as individual significance. But they are not merely introduced as types, to pass off a work of historical interpretation as a piece of fiction. If neither Nathan Burke, nor the Duceys, nor Francis Blake, nor Jim Sharpless, nor Uncle George ever really lived, they have something at least of that imaginative reality which belongs to the people of "Tristram Shandy" or "The Virginians" or "Joseph Vance." Young George Ducey and Nance Darnell hold a less secure footing. If George Ducey were not quite so despicable, and Nathan Burke not quite so admirable, the cautious modern reader might be more readily won to an acknowledgment of their virtue as ideal conceptions. But in their setting they are like to win him on their own terms.

There is a suggestion of artifice in the strongly Thackerayan flavor of the style, with its frequent digressions into that plaintive elegiac strain which grows a little mawkish in Thackeray's later pages. The vein is perfectly natural from the pen of the supposed narrator, a middle Victorian in his prime and a professed admirer of the great Jeames: we must admit that it crops out also in the author's (or editor's) Introduction.

Dan Merrithew. By Lawrence Perry. Chicago: A. C. McClurg & Co.

Here is an addition to the long list of books which come near to spoiling themselves by trying to be at once sea-stories and love-stories. There must perhaps be a rich ship-owner with an attractive daughter to offset the brawny, honest captain—and yet, why? Why not a book made of the best of such exploits as this—and its best is excellent—and omit the dinners at rich men's tables where the hero sea-dog accomplishes "with easy grace and unconsciousness" the "difficult feat" of entering the drawing room after the other guests have arrived? A mariner's unexpected *savoir vivre* in "dealing with the courses," his total lack of intention to swallow his knife, or even his fork, together with the discovery that he has been captain of the eleven at Exeter, of course constitute social rehabilitation for the sea-dog, but the reader feels small and foolishly amphibious in assisting at the watching of these symptoms. Extract three-quarters of the girl and her "blush-surged" cheeks, and there remains a series of sea adventures which would make a good, even a thrilling, book for boys of both sexes and all ages.

It must be admitted that there is originality in a heroine who so far loses her head as to lock herself into her stateroom when the vessel is on fire, and recovers it enough to make fudge in the galley while floating about in a derelict. Life on a derelict amply furnished with woman's garments and canned food is indeed as inspiring as a Swiss family Robinson tree. It is appreciation of its possibilities and of Dan Merrithew's seaworthiness that prompts the wish for more salt and less society.

Lost Face. By Jack London. New York: The Macmillan Company.

Nothing that Mr. London does can be quite ignored by a critic of contemporary fiction. He has the knack; and, however much his personality and method may offend, they are to be reckoned with. He represents a school or a tendency of fiction which has asserted itself strongly of late. No doubt it is partly the result of the labors of our yellow press in the dissemination of horrors. If we no longer go to public hangings, we need not feel the deprivation acutely. For a penny a day, we can see the murderer strike the blow, hear the victim's death-struggle, dabble in the blood of the departed, and thereafter follow the murderer every step of the way to the electric chair—and beyond. The popular magazines are bound to take their tone from the popular newspapers. They do not report actual murders, but fiction may be made as bloodthirsty as you like at small cost. It seems to us that the brutal story, the slogging story, the story not necessarily of crime, but of horrible suffering, is becoming more and more undisguisedly a staple of our magazine fare. How many times during the past few years have we been encouraged to gloat over the spectacle of the man dying of thirst in the desert. The cracked lips, the black and swollen tongue, and all the rest of it—they have been made as familiar to our fancy as the lover's sighs of an earlier and tamer fiction. We know how horses are tortured to death, how sled-dogs are flayed to their last effort, and eaten for their pains. We know too much for our peace of mind already. But the story-writer is determined that we shall know more: Mr. London, in particular, seems willing to spare us nothing. In his latest collection of tales, we find several of the familiar horrors retailed with the customary detail—men who die by inches of cold or hunger, and so on. But in the title story, the writer makes a really distinguished addition to his series of brutal exhibits; describing in detail the (one might think) unspeakable torturing to death of a huge Cossack by a band of Nulato Indians. We recognize Mr. London's talent; but he seems to us the victim of a disease of the fancy from which, and from the effects of which, it is impossible not to shrink.

MR. MARSHALL'S PSYCHOLOGY.

Consciousness. By Henry Rutgers Marshall, M.A., L.H.D. New York: The Macmillan Co. $4 net.

This work is a systematic treatise on psychology. It might be called, in a paraphrase of Spencer's familiar title, "A System of Synthetic Psychology." Its striking design is to bring all the phenomena of consciousness together under the conception of a mental continuum, a sort of psychic sea, every part of which influences every other, and in which a particular sight, sound, or emotion is a mere "emphasis," a wave of the sea. Dr. Marshall departs, of course, from the traditional division of mental facts into knowing, feeling, and willing. He departs equally from the method of taking different species of consciousness, such as sensation, imagination, conception, and the like, as subjects for unconnected chapters. It is one of the capital merits of the book that it represents a thoroughgoing sensationalism. Dr. Marshall would no doubt reject the term, and with some reason. He is entirely free from the crudities of sensationalism. But he has this vital tie to the sensationalist way of thinking: for him all mental facts whatever are on exactly the same footing; they all equally reflect the workings of a nervous system which is called into action by impressions from without. He rejects the view that consciousness is directly correlated with the action of the cerebral hemispheres only. But no one has worked out a psychological system with such constant attention to the correspondence between the life of the nervous system and the life of the mind, the correspondence between the noetic and what, in an admirably coined term, he calls the neururgic. His system is built on the basis of the analogy of these two, and he constantly derives light now on one,

now on the other, from the nature of its partner.

Dr. Marshall ranges all the varieties of mental life upon five quantitative scales; the scales of intensity, manifoldness, realness (stability), pleasure-pain (which he calls the "algedonic" quality), and the time-quality. This gives him a sort of psychological mechanics in which the foregoing attributes take the place of the volume, density, velocity, etc., of matter. Such features of consciousness as attention, will, belief, are explained by the presence and proportion of these attributes in each of them. Thus, attention is explained in terms of a certain correlation of intensity and manifoldness. Belief is analyzed with reference to the correlation of realness and manifoldness. Dr. Marshall offers an important analysis of a troublesome topic, the relation in consciousness of intensity to vividness; what recent psychologists have distinguished as vividness he resolves into a form of intensity seen under peculiar conditions. According to his scheme the self is simply the field of inattention—the most dubious of the larger doctrines of the book. The so-called self which we know in the field of attention, "the empirical ego," is, on the other hand, a "simulacrum" of the self. The "active will is the reaction of the empirical ego upon its object." Amongst the corollaries of his psychology, the author gives us a valuable analysis of our sense of freedom in willing, reconciling it with determinism and thus offering a peaceful adjustment of the long-standing controversy.

The briefest characterization of the work is that among all possible psychologies it stands at the furthest extreme from that of Professor James. The latter fastens on the concrete, the peculiar, the unique. He has a gift for painting the living facts of consciousness. He is resolved to fend off all attempts at theoretic analysis that do less than justice to the individuality of a special fact. He does not give us, he does not deem possible, an all-dominating system. Dr. Marshall's psychology is emphatically "system" and "synthetic." "Consciousness must be looked upon as a vast system of minor psychic systems of enormously intricate relationship." So much is he bent on systematic survey, on setting forth the plan and diagram of relations, that the particular conscious impression, on which Professor James so lovingly lingers, appears as a mere wave in the psychic sea. The world of mind, even of an individual mind, is, for Professor James, in his own phrase, "a pluralistic world." Dr. Marshall is a monist. A psychological world in which a particular perception is called "an emphasis" reminds us of Spinoza's universe, in which a particular object is called a "mode." We are often tempted to call Dr. Marshall the Spinoza of psychology—not, of course, that there is reason to fancy any actual influence whatever upon him from that quarter. He is nothing if not original. The danger of Professor James's treatment was that of losing sight, in describing the individual fact, of that organization of facts which is the aim of science. The danger of Dr. Marshall's treatment is that of occasionally blurring, in the absorbing interest of organization, those individual facts which are the subject-matter of science.

There is no space to enter upon the analyses of the chief mental phenomena offered here. We must call attention, however, to the bold and closely reasoned chapter on Representation. When we say in the conventional phrase that no psychologist or thorough student of psychology can afford to leave the book unstudied, we speak in a literal and emphatic sense. It unmistakably stands among the most important volumes on the subject produced in this country. We find, however, as we read, a certain query arising. It is true, of course, that the activity of any part of the nervous system depends upon that of every other part, but the degree of interdependence of any two parts depends largely on their topographical relations and the existence of "neururgic" tracks connecting them. Now, in Dr. Marshall's account, the special topographical relations of brain, nerves, etc., in the human body are hardly considered at all. One questions whether he has not, in the interest of his quantitative system, made abstraction of certain essential factors that really to some extent interfere with it.

There is another query suggested by the very thoroughness and synthetic grasp of the author's system. Science has made outward nature a purely quantitative and calculable affair by stripping away one after another the appearances that resist this treatment. The qualities of color, smell, taste, sound—these science has dismissed one after another and explained as effects upon us of matter in motion. The qualities left to matter are such only as quantitative science can deal with. All the qualities stripped away as being merely "subjective" are taken over by psychology. Now, Dr. Marshall brings similar scientific methods to bear upon consciousness itself, and reduces it to a continuum of which the attributes can be arranged upon a quantitative scale, like those with which mechanics deals. What has he done, then, with those abrupt differences of quality of which science had to get rid before it reduced the material world to a purely quantitative thing? What does he do with the difference of experienced quality between red, green, a scream, and a toothache? An experience of any one of these is for Dr. Marshall an "emphasis" in the continuum of consciousness. We can understand on his principles to what quantitative influence the rise of such a wave is due. He does not, however, help us to understand why the different emphases in question possess their incommensurable qualities. If psychology could ever find a scale of sensuous quality upon which to arrange all such experiences whatever, could find a quantitative relation of one to the other, such as we now theoretically have for the *timbres* of the different instruments of the orchestra, it would indeed solve a great problem. It would reach the ideal toward which this book takes so large and masterly a step.

The Iron Cardinal: The Romance of Richelieu. By Joseph McCabe. New York: The John McBride Co. $3.50 net.

The number of so-called "popular biographies" of famous historical characters, which pour forth in annually increasing numbers, is a not altogether encouraging sign of the times. Such books must obviously have a wide circulation, and pay well; otherwise they would not be produced. They invariably possess the same attractive features; good type, thick paper, sumptuous illustrations. And yet when one comes to analyze them carefully, one finds scarcely one in a dozen that possesses any permanent value. As a matter of fact, they fall between two stools. They are neither history nor fiction; indeed, it is probable that the very secret of their success lies in the fact that they are a little of both. The average man of today has apparently neither the time nor the inclination to peruse standard historical works, even though they be written as brilliantly as those of Macaulay, Carlyle, or Froude. On the other hand, he does not wish to confess that his reading is entirely restricted to novels. So, as the easiest way out of the difficulty, he seizes upon the "popular" or "romantic" biography, and fancies that he is getting at the central facts of history by a short-cut. The custom is by no means utterly reprehensible. It has long been recognized that one of the best methods of studying history is through biography; and, to take the example before us, the reviewer has no doubt that the average reader will rise after a perusal of Mr. McCabe's book with a much better knowledge of Richelieu than he had when he began it. Yet one cannot help regretting that standard authors are neglected in these days for works of this sort.

Mr. McCabe's book is certainly not worse, and probably somewhat better, than the majority of the class to which it belongs. The author (who has already produced four other biographical works), has obviously read widely in contemporary records, though he shows little discrimination in estimating their

relative values; and he steers clear of most of the older and more persistent errors concerning Richelieu's career and policy. Indeed, the book is remarkably free from definite misstatements of fact, though the spelling of proper names is often inaccurate, *e. g.*, "Goligal" for "Galigai" (p. 47); "Brisach" for "Breisach" (p. 289). But our main gravamen against Mr. McCabe's work is the impression of Richelieu's career which it must necessarily leave on the reader who knows naught of the man or the period—an impression of backstairs intrigue, feminine jealousies, scandalous love-affairs (*e. g.*, the episode of Buckingham and Anne of Austria, which is related at excessive length, and with unnecessary gusto), and little else. That this was all part and parcel of the Cardinal's life we should be the last to deny; but we question whether any life of Richelieu (even though the author specially warns us that he has chosen "the more picturesque side" of his subject's career) is justified in dwelling on these things to the virtual exclusion of the Diet of Ratisbon, the Thirty Years' War, or the system of central government, which the Cardinal did so much to establish. Should we not get quite as good a conception of the "romance of Richelieu" and at the same time the satisfaction of becoming acquainted with a standard work of permanent importance, by reading Alexander Dumas's "Trois Mousquetaires"?

How to Save Greek and Other Paradoxes of Oxford Reform. By T. C. Snow. London: Simpkin, Marshall & Co.

Lord Bowen, in the preface to his translation of Virgil, said that professional scholars defending the claims of the classics reminded him of a timid elderly traveller fussing over his luggage at a crowded railway station. The satire hit off the uneasy and undignified impatience of the old-fashioned scholar confronted with the claims of the sciences. In this atmosphere arose the phrase "Compulsory Greek," that unhappy phrase by which Oxford and Cambridge are both distracted intermittently. But one observes that, though the modern classical don has not reverted to the supercilious disdain which preceded the fussy alarm of a generation ago, he no longer apologizes. This is partly because the study of Greek in the United Kingdom has not, after all, declined in the course of the last twenty-five years, but is more serious than ever. There is everywhere at the present day a more widespread and more intelligent recognition of the fact that each generation in its turn must look to Greece, to the analytic and amazingly intelligent Greeks, for the quickening of the spirit to appreciate literature and life. Roman literature, Roman ideals, stand fixed and understood for all time. What we mean by Roman, we know, but what do we mean by Athenian? The history of Greek literature must forever be rewritten, the Greek masterpieces retranslated. Pope's Homer was for the eighteenth century, Mr. Murray's Euripides is for the twentieth; yet just as the one version was not Homer, so is the other not Euripides, but what the modern reader desires to find in Euripides.

Mr. Snow is one who realizes the tried strength of Greek studies and speaks out loud and bold. There ought to be more Greek in Oxford, not less, and no concessions must be made to the idea that a great university should aim at teaching everything. The mission of Oxford is to support just those studies that "have no money in them," and to leave to other universities, Cambridge, for instance, where science has a strong foothold already, to provide for those sons of the upper and middle classes who demand training in medicine, engineering, and manufactures with the minimum of non-professional study. The sciences are to be bowed out of Oxford, even medicine, the school that has so lately been re-created; for Oxford cannot and should not compete with towns that furnish their medical school with hospital experience. On the same principle, the new School of Engineering is, of course, a step in the wrong direction, since Birmingham, only an hour away, has an engineering plant that Oxford can never hope to rival. Agriculture and commerce must be studied in an atmosphere more suitable. All this is in direct opposition to the scheme for Oxford reform proposed by Lord Curzon in the *Morning Post*. Mr. Snow's plan for encouraging Greek is to demand a great deal more reading of the texts and hardly any grammar and composition. Latin prose composition must go:

> When you look at the greater classics on a bookshelf and see how little space they take up, it is both ludicrous and pathetic to remember how little of them the ordinary scholar of a college has read and how poorly qualified he is to go on reading any more. In my own youth my daily preparation was a scramble through perhaps sixty lines of a text and hours of painful hammering at a piece of composition. If only I could have given my Latin prose time to reading the classics, I should have known something about them, and I should still have had my Greek prose time for German and my Latin verse time for Sanskrit. German alone is sufficient reason why boys should leave off composition.

Here is heresy from a distinguished classical don. But Mr. Snow's scheme has lately received the express approval of Gilbert Murray, the regius professor of Greek, and at this rate will soon become orthodox. Oxford's mission is, in fact, to give a literary education, with the classics as an indispensable basis. The youth who does not want this sort of training is recommended to go to one of the fourteen other universities in the kingdom. This sounds like an aristocratic ideal, but Mr. Snow is certainly not arguing for the privileged classes:

> The time when plutocrats are attacking Greek is the time for Socialists to take it up. For, indeed, so long as there continue to be rich and poor, literary studies ought to be the studies of the poor. They are the best way, as I believe, and certainly the cheapest and most portable way, of satisfying the mental and spiritual wants of life. It depends on their education whether they are to get their *circenses* out of gambling and fighting and drinking or at best out of sport and mere frivolity, or out of religion and knowledge and art and politics and poetry and humor and love—in short, out of the components of literature. As Bishop Fraser's friend told him, "Drink is the shortest way out of Ancoats." Give Ancoats a chance and Ancoats will find that Homer is a better way.

The details of Mr. Snow's scheme for remodelling Oxford we cannot give here, nor are they especially interesting to American readers. But it is to be noted that he desires to open the university to classes that have hitherto been excluded, and that he throws overboard with a fine scorn the snobbish ideal, so widespread in England, that the two great universities exist primarily in order to provide a "class-stamp." It is a healthy sign when the distinguished scholars of a university like Oxford begin to repudiate the mint-mark of social distinction.

The Expansion of New England. By Lois Kimball Mathews. Boston: Houghton Mifflin Co. $2.50 net.

To a limited circle of students of American history, Mrs. Mathews has for some time been known as the possessor of a remarkable series of maps showing the early roads of the New England and Middle Colonies, the spread of early settlement in the Eastern part of the country, and the westward movement of the frontier. On the basis, apparently, of this collection, and as an outgrowth of the labors incident to the preparation of it, she has now given us a book of unique importance. Local history, though zealously enough pursued these many years, can hardly be said to have yielded, in most hands, results of large general interest. What Mrs. Mathews has done, however, is to show, from an exhaustive study of local material, the forces which from the beginning determined the growth of settlement in New England; the course which the expansion took in the founding of new towns and the opening of natural avenues of communication; the effect of soil, climate, and accessibility, as well as of Indian wars and religious dissensions, upon migration; and the final overflow

of New England men and women, with their inherited political, social, and religious ideas, into western New York, the Ohio country, and Michigan and Wisconsin.

The wealth of detail here presented is so great that we can do no more than indicate, in the most summary fashion, the broad outlines of the story and some of the principal conclusions reached. While the New England Puritan followed from the beginning the advancing frontier westward, Mrs. Mathews points out that, for a century after the Restoration, expansion radiated from the communities founded prior to that date. By the outbreak of the Revolution, Massachusetts, Rhode Island, and Connecticut had been pretty thoroughly covered by these dispersions, the lower parts of Maine, New Hampshire, and Vermont had been occupied, and New England settlements had penetrated into Long Island, New Jersey, and the valley of the Hudson. The period from 1760 to 1775 saw the settlement of the Wyoming valley in Pennsylvania, the migration of Nantucket Quakers to Guilford County, North Carolina, and the ill-fated Phineas Lyman colony near Natchez, Mississippi. The war checked the movement only where actual hostilities took place; and, with the advent of peace, the stream of expansion spread into the hitherto thinly settled portions of northern New England and into the "Western Reserve," moving on after the War of 1812 into Indiana and Illinois. There was never a large New England element in Indiana, probably because of the presence of considerable numbers of emigrants from the South; but the movement into that State continued until 1840, and into Illinois until 1850. After 1840, however, the stream begins to flow strongly northward into Michigan and Wisconsin, from whence it later continues westward beyond the Mississippi into Iowa, Kansas, and Minnesota, and even to Washington and Oregon.

Of the migration of single families Mrs. Mathews, for the most part, very properly takes little account, since only in exceptional cases may one family be expected to become the spring of any distinctive social influence. It is with the migration of groups of families, or even, as was often the case, of whole churches or organized colonies, that we can observe important results in the establishment of New England towns, with their town meetings and democratic institutions, their churches, schools, and colleges, and their active interest in politics. The factors which have determined this orderly migration have been, first and foremost, the desire for fertile and cheap land, with its resulting possibility of an improvement of material condition; and, secondarily, a desire to escape from political or ecclesiastical controversy or from the domination of a political party. The disestablishment of the Congregational Church in Massachusetts and Connecticut, with the consequent extension of the franchise and final obliteration of the relics of Federalism, is one of the more striking illustrations of the way in which the frontier spirit, ever restless under the pretensions of tradition and caste, made itself felt; while the repudiation of John Quincy Adams and the enthronement of Jackson are to be ascribed largely to the same cause.

The labor involved in the preparation of this volume has obviously been very great. Town and county histories, biographies and genealogies, sermons and memorial addresses, guide-books, newspapers, and manuscripts have all been laid under contribution. Of the more important parts of this material account is given in bibliographical notes appended to the several chapters. The twenty-nine maps showing the location and extent of New England settlement at various dates and in various parts of the country, are in the highest degree informing, the only criticism to be passed upon them being that they are, in a number of instances, too small to be used easily without a glass. There is a good index.

Memories of Fifty Years. By Lady St. Helier (Mary Jeune). London: Edwin Arnold.

The Correspondence of Priscilla, Countess of Westmoreland. Edited by her daughter, Lady Rose Weigall. New York: E. P. Dutton & Co. $5 net.

Lady St. Helier, better known as Lady Jeune, has made a contribution to the body of *mémoires pour ne servir à rien*, in which modern English literature is peculiarly rich. Her book is a prolonged " society column," giving the hostess an opportunity to chronicle the success of her own dinner-parties, and to say to posterity, "I shall never forget my pride the first time Lord Beaconsfield dined with me, . . . nor the delight with which I heard that the House had been counted out earlier, so that many members of Parliament were able to come to my evening party." She must be credited, in contrast with some other authors of the same class, with an entire absence of scandal, doubly meritorious in the wife of the famous judge of the Divorce Court. Nor does she claim to have had an offer of marriage from Disraeli. Otherwise her right to distinction must rest on an occasional novel historical dictum, such as that Judah P. Benjamin had "attained to the highest legal position in his own country—that, namely, of Attorney-General to the Southern Confederacy"; or on a contribution to the terminology of ethnic science, as when she says of M. de Blowitz, who resented being called a Jew, that "his descent was cosmopolitan."

Of very different value is the correspondence of Lady Westmoreland. Priscilla Pole, born in 1793, was niece to the Duke of Wellington and the Marquis Wellesley. At the age of eighteen, she married Lord Burgersh, afterwards Earl of Westmoreland, who filled a succession of important diplomatic posts. Through her own connections and her husband's profession, she was constantly in touch with great affairs and became an example of what is, perhaps, the most characteristic, as well as the most striking type of Englishwoman, and one which should be carefully studied by all who are anxious to see women take part in political life. She was trained as carefully as though she were destined for diplomacy in her own person. When she was married, she had already, her daughter says, "the habit of society, a perfect knowledge of French and Italian, and a good general idea of the leading questions of the day." She was beautiful, which hurts nothing, and enough of her character appears in the carefully selected letters to explain the friendship entertained for her by the most important men and women of her time. Intimate letters from Count Pozzo di Borgo, attached in 1813 to the court of the Emperor of Russia, from Mme. de Staël and Schlegel, from Meyerbeer and Humboldt, from the King and Queen of the Belgians, give deeply interesting glimpses of the personages of the early nineteenth century. Pozzo reflects the impression the great Corinne made on her contemporaries. He will not give her a letter of introduction to Lady Burgersh, because she is too overwhelming. "The good qualities, the faults, the weaknesses, the cleverness, and the talents of Madame de Staël subdivided and distributed might have formed a whole population of amiable and attractive women, but all united in one have produced a kind of monster."

Lady Westmoreland's own letters give continuity to the moving picture. When her husband is abroad without her, she sends him a systematic account of political conditions in England, so clear, so just, so well-reasoned, so carefully based on first-hand information, given her with confidence by very great people, that it is plain she was an invaluable *chargée d'affaires*.

The Idea of a Free Church. By Henry Sturt. New York: The Walter Scott Publishing Co.

This is a remarkable book, all the more remarkable as coming from a member of the University of Oxford. Its purpose is stated in the following words:

> The task which the present book proposes is to suggest a religion and a church more satisfactory than the Christian. It is inspired by the conviction that our established religion is now utterly insufficient to satisfy a thoughtful mind, and that

all progress, moral and intellectual, demands that Christianity should be given up and replaced by something better.

It contains a very severe arraignment of Christianity on religious, moral, and historical grounds, and proposes a new and "free religion" to take its place. The elements in Christianity which the author most dislikes are its humility, its femininity, and its asceticism. He emphasizes the worth and dignity and freedom of man, and would have a masculine religion, summoning men to stand upon their feet and inspiring them to manly labor in and for this world. Religion, he says, should not "strive to reduce man's strength and his pride in his strength and his will to live; it should rather encourage him therein." Its true function is to stimulate him to enterprise and aspiration. Great emphasis is laid on public spirit, patriotism, and social service, and there are many stimulating passages on the importance of resolute and vigorous realization of high ethical ideals. But the criticism of Christianity is shallow and in large part misplaced. If it were only what the author represents it to be, it might indeed merit condemnation by modern men. But he takes account of its worst and weakest elements alone, and fails altogether to do justice, for instance, to the inspiration of its ideal of the Kingdom of God on earth, which is coming to mean much in modern Christian thought and life as it did in the teaching and work of Jesus Christ himself.

The striking thing about the book is not the author's estimate of Christianity, for in this he is representative of a modern tendency which was already widespread in the eighteenth century; the striking thing is that he is a zealous champion of religion. He would not do without it as would so many modern men, whose general attitude is like his. He thinks religion important, and he spends a considerable part of his book in defining what he regards as right religion and in defending its claims. He is an enthusiast for a religion which shall really meet the needs of the modern man and which shall appeal particularly to the intellectual and cultured classes. "The most superficial observer," he says, "cannot fail to see an immense and old established evil—all the thoughtful people in one camp and all the religious people in another. What an enterprise is here to set the imagination aflame: what a Macedonia is this calling Come over and help us—salvation to nations wrestling doubtfully against a hateful tyranny: light and hope and peace to souls threatened on either side by the grim spectres of superstition and atheism." Religion, as he defines it, means faith in God and coöperation with Him in the promotion of human progress and welfare:

The fundamental principle of right religion, then, I take to be the conviction that man can do something for God. The man with right religion regards human life not as isolated, but as forming part of the cosmic system of which God is the intelligent mover. The ultimate meaning of our freedom is that we are free to help in the cosmic system.

The book is vigorously written and deserves reading, especially by Christian preachers and teachers, just because it represents a common spirit and attitude with which they must reckon.

Notes.

"The Life of Mary Lyon," by Beth B. Gilchrist, is announced for publication this week by Houghton Mifflin Company.

"Psychology in Common Life," "Character and Temperament," and "The Health of the Mind" are books which the Appletons will soon publish under the editorship of Prof. Joseph Jastrow of the University of Wisconsin.

The imperturbable Baedeker has brought his "Great Britain" to a seventh edition for the year 1910. The book in its English form is written by J. F. Muirhead, who also writes "The United States"; it is imported by Chas. Scribner's Sons. To attempt to review Baedeker would be like trying to review a great phenomenon of nature. We observe that Mr. Muirhead in the preface alludes to a separate volume on Scotland which he hopes to publish on some future occasion.

The University of Chicago Press issues a second edition of its "Manual of Style," with revisions suggested by its greater experience in publishing a large number of books in a variety of fields. Printing offices differ in a number of rules: for instance, the University of Chicago Press italicizes titles of books, whereas many other presses mark them by quotation marks. But, bearing these exceptions in mind, every writer will be profited by going through this little book with care, when preparing his manuscript for the press.

Kurdistan is described in the *Geographical Journal* for April, by Capt. B. Dickson, as a paradise for the archæologist. On one mountain which he visited he found "every variety of architecture, from the cave of the Troglodites to the mud hut of the Kurd, with Assyrian, Persian, Greek, Roman, Arab, and Seljuk intervening." The most marked characteristic of the present inhabitants is their absolute lack of unity, each separate village being of a different nationality and religion from its next-door neighbor. Problems of Central Asian exploration are discussed by Ellsworth Huntington of Yale, a leading authority on the subject, "the most fruitful and fascinating" of which is the determination of the effect of physical environment on the distribution of human occupations and modes of life, and also of political, mental, moral, and religious characteristics. An earnest plea for the better teaching of geography is presented by R. H. Whitbeck, University of Wisconsin. He advocates the humanized course as being rich in content, more valuable in giving culture and more liberalizing in its influence than the old-fashioned method of instruction in physical geography.

A. R. Orage's little book, entitled "Nietzsche in Outline and Aphorism" (McClurg & Co.) may be recommended as on the whole the easiest *vade mecum* to that German phenomenon. The plan of the work is simple and orderly. An historical introduction is followed by a set of selected aphorisms under the head of Definitions. Then come a series of brief explanatory introductions, each followed by its appropriate quotations. The titles of these sections are: Philosophy; Life; Man and Woman; Art; Morality; Good and Evil; Willing, Valuing, and Creating; Superman; New Commandments. Nietzsche is at his best in these bullet-like aphorisms, and those here gathered far and wide from his works may be read profitably, without any thought of a systematic philosophy. It is a question, indeed, whether any attempt to read a system into Nietzsche's writings is not contrary to the spasmodic nature of his genius, although there can be no doubt in regard to his relation to certain main currents of thought in the nineteenth century. Mr. Orage is a disciple of Nietzsche, to whom he pays reverence as to the prophet of the future. But he is an honest expositor, and the alert reader, by going through these introductions and comparing the various aspects of Nietzsche's philosophy, will have no difficulty in determining the place of that philosophy, and in laying his finger on its weakness.

It would be dangerous to say that any book about the great Johnsonian group was superfluous, but the word disappointing can safely be applied to A. M. Broadley's "Dr. Johnson and Mrs. Thrale" (Lane). The book belongs to a tendency very manifest of late years to exalt Mrs. Thrale at the expense of Johnson, although, in the present case, there is no endeavor to treat the gentleman with the sort of irate contempt which was so noticeable in F. Frankfort Moore's "Georgian Pageant." The occasion of the book was the sale of the Piozzi MSS. at Sotheby's, June 4, 1908, and the celebration of Johnson's bi-centenary at Lichfield, September 15, 1909. Among the MSS. dispersed was an unpublished and hitherto unknown "Welch Journal, 1774," by Mrs. Thrale, which gave an account of her journey through Wales in company with Dr. Johnson, her husband, and her eldest daughter. This document was bought by Mr. Broadley and forms the heart of the present volume. Johnson's "Diary" of the same journey is printed with it, together with scrappy and quite unnecessary chapters on the two diarists. We are glad to have Mrs. Thrale's "Journal." It is not particularly interesting, but it presents the lady as a most amiable, if at times rather bored, person, showing her as an attentive mother, and thus dispelling some of the opprobrium that has settled upon her for maternal indifference. On the return of the party she was carried by her husband, on account of a Parliamentary election, to Southwark, and not to Streatham. The closing words of her "Journal" afford a vivid glimpse into the gloomier side of her life:

I thought to have lived at Streatham in quiet and comfort, have kissed my children and cuffed them by turns, and had a place always for them to play in, and here I

must be shut up in that odious dungeon, where nobody will come near me, the children are to be sick for want of air, *and I am never to see a face but Mr. Johnson's.* Oh, what a life that is! and how truly do I abhor it! At noon, however, I saw my Girls and thought Susan vastly improved. At evening I saw my Boys and liked them very well, too. How much is there always to thank God for! but I dare not enjoy poor Streatham lest I should be forced to quit it.

These words of Mrs. Thrale are not the only indication that she had grown weary of the great lion who had made her salon one of the most notable features of the literary society of the day. They prepare for the rupture that was to follow when she announced her intention to take the Italian singer, Piozzi, as her second husband. From thence the tears. In an "Essay Introductory," contributed by Thomas Seccombe, this old question of the rupture between Mrs. Thrale and Dr. Johnson is again argued, and the blame, on the whole, is laid upon the gentleman's shoulders. That Johnson displayed, through vanity, or some other cause, even more than his wonted bearishness, cannot be gainsaid. His first letter to her on hearing of the marriage was a monstrous insult, and was nobly answered. The objections to Piozzi, so far as we can see now, merely displayed the British insularity and snobbishness of the day. All this we can grant to the supporters of Mrs. Piozzi. But there are other aspects of the case which should not be ignored. Her feeling in old age for the handsome young player, Conway, may have been merely a "sentimental caprice," as Mr. Seccombe calls it, but its fantastic expression leads one to surmise that her love for Piozzi at the age of forty-three may have been attended with certain marks of infatuation which would quite naturally cause dismay to her friends. However, we have no objection to any chivalrous defence of Mrs. Thrale, so long as justice is maintained for a far more important personage—and this justice Mr. Seccombe, as a good Johnsonian, has tried to respect.

"The Landscape Beautiful," by Frank A. Waugh (Orange Judd Co.), is a medley of rather gushing descriptive writing, of sensible remarks on landscape gardening in which art the writer is an authority, and of confused dallyings with the difficult science of æsthetics. There are many attractive photographic prints of landscapes, natural and artificial. The book is eccentrically printed, without justification of the right-hand edges of the pages. Possibly the serrations symbolize a sky line. The style is absolutely undistinguished, and except for the chapters tracing the history of American landscape gardening, the work seems without essential value. Since it embodies the diffused nature worship of the time, eschews accurate feeling and thinking, and is eminently cheerful in tone, it seems to have the chief requisites for popularity.

Vero Shaw's "Encyclopædia of the Stable" (Dutton) is the work of an authority upon horses and their care, and the information here given is the result of many years of close association with the horse and his breeders. The book should prove particularly valuable to those who are, for the first time, indulging in the pleasure of possessing a stable of their own. Among the illustrations is a copy of a painting of "Old Bill," a horse owned in Edinburgh, made when the animal was fifty-seven years old. The animal died at the extreme age of sixty years.

"Man's belief in immortality is still essentially the same as it was when Socrates trusted himself to it, while he drank the fatal hemlock. It is the irrepressible faith of man in his own survival value." This is the conclusion to which Dr. Newman Smyth arrives in a pleasing and persuasive essay on that religious theme about which, probably, more is written than about any other article of faith, but regarding which there is less to be said that is substantial and convincing. He seeks to show that the convictions of a modern mind do not render belief in personal immortality impossible, but, on the contrary, that a more spiritual and noble confidence in the continuance of life is within reach of the devout soul of to-day than was accessible before the revolutions of modern science ("Modern Belief in Immortality"; Scribner).

Most of the Harmonies of the Gospels leave the student at much pains to single out the phrases and expressions peculiar to the several gospels. The material is there, but comparative study is still difficult. J. M. Thompson, of St. Mary Magdalen College, Oxford, in "The Synoptic Gospels arranged in parallel columns" (Henry Frowde), has arranged the English text of the Revised version so as to allow of comparison verse by verse and word by word. The work is in three parts: Part i follows the order of Mark and adduces the parallels from Matthew and Luke; part ii gives the text of Matthew in the first column; part iii follows the order of Luke. The student of the origin and manner of composition of the gospel story will find this handbook of great value.

The second volume of Hastings's "Encyclopædia of Religion and Ethics"(Scribner), containing the titles from Arthur to Bunyan inclusive, follows the lines of Vol. I (see the *Nation* for February 18, 1909). The writers are drawn from all over the world—of the 162 contributors 116 are furnished by the British Empire, 17 by Germany, 12 by this country, and the rest by France, Holland, Belgium, Italy, Sweden, India, Hungary, Finland, and Japan. Combination articles (in which one man supplies an introduction, and the different countries are assigned each to a specialist) are those on Asceticism, Atheism, Atomic Theory, Baptism, Bards, Birth, Blasphemy, Blessedness, Abode of the Blest, Blood-feud, Body. The advantages and disadvantages of this arrangement are obvious. Among the more important articles may be mentioned: Aryan Religion (by O. Schrader), a suggestive survey of what may be considered primitive Indo-European religious beliefs and practices, with the hazardous assertion that the entire social organization of primitive times rests in the last resort on ancestor-worship; Arya Samaj (by Anesaki) and Brahma Samaj (by J. N. Farquhar), the two giving a clear account of the great Hindu theistic movements; Bab, Babis (by E. G. Browne, the best authority on the subject), a much-needed statement of the history of Babism and of its present condition; Bhagavad-Gîta (by R. Garbe) and Bhakti-Marga (by G. N. Grierson), descriptions of a very remarkable and little known phase of Hindu religious thought; Bantu (by E. S. Hartland), Bengal (by W. Crooke), Berbers and North Africa (by R. Basset), Brazil (by L. Spence), surveys of the present state of religion in these countries; Bridge (by G. A. F. Knight), a full and illumining discussion of the beliefs and usages connected with bridges; Baal (by L. B. Paton), a virtually exhaustive collection of the facts relating to this Semitic divine title. As in the first volume, so here there are certain articles that have no references to religion or to ethics; such are Association, Atavism, Atimia, Atrophy, Attraction and Repulsion, Bards, Biology, Blindness, Brain and Mind, and the greater part of Atomic Theory. Points of connection with religious or ethical thought might have been found in all these, and it is difficult to see why they should have been inserted in their present form. Undesirable breaks occur in some of the composite articles: in the Abode of the Blest the Christian view is relegated to Chiliasm and State of the Dead, though comparison of the Christian conception with others would here be valuable (and the separation of the treatment of the abode of the blest from that of the abode of the damned is not fortunate); Hindu asceticism is described in the article Ascetieism, but for Vedic asceticism we are referred to the article on Vedic Religion. The article Book of Life (by A. Jeremias) is largely vitiated by the writer's introduction of his grotesque astral theory. The nature of the work makes omissions unavoidable, and there are particular statements and opinions that are open to criticism, but the volume as a whole is a valuable contribution to the history of religious and ethical ideas.

It is probable that there is no single branch of our national industrial organization in which efficiency on the part of all classes of employees is more imperative than that which is concerned with the actual business of transportation. And when we consider that the railway business alone of the United States is carried on by a highly organized army whose numbers are rapidly approaching the two million mark, it is not to be wondered that a conscious movement should now be in progress for increasing their general efficiency. It is only within comparatively recent times, however, that the subject of special education for the railway service has received anything approaching the attention which its importance merits; but the future promises changes of far-reaching significance. The whole question, in its broadest aspects, has been made the object of study by J. Shirley Eaton, formerly statistician of the Lehigh Valley Railroad; and the results of his investigations have recently been published in a highly interesting bulletin of the United States Bureau of Education under the title of "Education for Efficiency in Railroad Service." By way of comparison, this monograph is all the more illuminating when considered in connection with another upon the same general subject prepared by Mr. Eaton a decade earlier, and published in the Report of the Commissioner of Education for 1898-99. Ten years ago, as the writer points out, the ideas of railway men upon the subject of special education were extremely diverse. Since then there has been a marked tendency towards crystallization of opinions:

The advance made in the present decade is very surprising to those who may not

be informed. Ideas of practical men on the subject are now less indefinite and conflicting. The relation between education and efficiency in railroad service is coming to be generally conceded. The most successful managers have seized on its financial import, and in their fiscal policies and operating organizations are giving it recognition. The large educational value of the railroad service itself is being turned to systematic practical account, and the value of educational agencies in preparing for specific industrial efficiency is better understood. The matter has reached the stage of devising best ways and means of applying principles now coming to be generally accepted by the most practical men.

After an extensive examination of the problem involved in the present-day situation, Mr. Eaton proceeds to outline a scheme looking towards an improvement of present conditions. In brief, the conclusions arrived at are that railway managers should adopt an educational programme as a clearly defined part of their general policy; that the programme thus initiated should be put into the hands of a superintendent who should be responsible to an official ranking high in the service; that this superintendent of education should cooperate and join forces with every outside educational agency, in all matters concerning which it might be practicable to do so; that the system of graded apprenticeship should be extended so as to cover ultimately every department of the service, and that separate and apart from the wage based upon seniority there should be an efficiency wage, based upon the actual service of the employee.

In 1868, the year after the expiration of Cotta's exclusive right to publish Goethe's works, the Berlin publisher, Hempel, began to issue his oft-cited edition in thirty-six "parts," the last volume of which appeared in 1879. Though long distinguished for its carefully-edited text and scholarly introductions and commentaries, this edition has of late years called for revision. Bong & Co. of Berlin have recently begun to issue their complete edition based upon it, the so-called Goldene Klassiker Ausgabe, with new introductions and commentaries, that are to embody the important results of discovery and investigation during the intervening thirty years, supplemented by fresh contributions from a large corps of editors under the general supervision of Karl Alt. The edition is called complete, though it is to comprise neither letters nor diaries, and will exclude the less important scientific writings. The arrangement is the traditional one, according to subject and form, rather than the chronological order which is becoming so popular with other publishers. The introduction and text (forty "parts") are to occupy seventeen volumes, while volumes eighteen and nineteen are to be devoted to commentary, and volume twenty to a comprehensive index. The set is advertised at prices ranging from a mark and a half a volume unbound, to four marks for the best paper and binding. From three to six volumes are promised annually, and the final volume is to be out before Christmas, 1912. Of this edition there have appeared thus far Vols. III, IV, and XI, the eight "parts" of which are edited by Robert Riemann, Eduard Scheidemantel, Karl Alt, Christian Waas, and Rudolf Pechel. In the revision of the text the editors seek to strike a mean between the Weimar edition, which follows the edition of last hand, and the Jubiläumsausgabe, which reverted to Goethe's original text, eliminating, so far as possible, the alterations made by Riemer, Eckermann, and Göttling, whom Goethe allowed certain liberties, with regard to the outward form of his works. The introductions are written with a view to the needs of the educated reader. The volumes of the set that will be looked forward to with most interest by Goethe scholars, are those containing the commentary and the index, since these are the only features by means of which the edition can hope to become a real rival of either the Jubiläumsausgabe or the edition of the Bibliographisches Institut, both of which are better printed on better paper, and at the same price per volume, though there are more volumes in the set, forty in the one and thirty in the other.

Dr. Charles Werner's "Aristote et l'idéalisme platonicien" (Paris, Félix Alcan) maintains the tradition of French Aristotelians for neatness of systematic exposition and precision of dialectic. It deals somewhat abstractly with the metaphysical aspects of Aristotle's philosophy, to the neglect of the concrete detail of the treatises on the physical and moral sciences. The main thesis (not wholly novel) is that Aristotle, despite his rejection of Platonism, is essentially a Platonist, and that his doctrine of immanent realism in respect of concepts is exposed to all the objections which he brings against the transcendental realism of Plato, which it is the fashion to call idealism. Like Zeller, then, Dr. Werner finds a fundamental contradiction at the base of the Aristotelian philosophy. But he believes that he has defined it more precisely and located it more exactly than Zeller had done. His most original thesis is his contention that God, in the Aristotelian system, is identical with the soul of the universe. A Prime Mover whose one definite function is the rotation of the heavens must be simply the soul of the heavens, that is, the soul of the world. Dr. Werner admits, however, that God is also the collectivity, or world, of the ideas. His final meaning, then, seems to be merely that Aristotle's God is to be conceived pantheistically rather than theistically.

Henry S. Brooks, a journalist and author, died last week, at the age of eighty. He had edited papers in California and had published "Doña Paula's Treasure," "A Catastrophe in Bohemia," and "Progression to Immortality."

Richard Dacre Archer-Hind, the English classical scholar, died recently at Cambridge. He was born in 1849, graduated at Trinity College, Cambridge, in 1872, and from 1875 to 1903 was a classical lecturer there. His publications include the "Phædo" and "Timæus," of Plato, and "Translations into Greek"; and he was co-editor of "Cambridge Compositions."

Dr. Ludwig Oelsner, the German historian, died recently in Frankfort, at the age of seventy-eight. His publications include "Der Volkswirtschaftsunterricht auf Schulen," "Kaiser Karls IV Jugendleben von ihm selbst erzählt," and the "Jahrbücher des Fränkischen Reiches unter König Pippin," which he edited for the Historical Commission of the Bavarian Academy of Sciences.

Science.

Airships in Peace and War. By R. P. Hearne, New York: John Lane Company. $3.50 net.

This is a second and greatly enlarged edition of the author's "Aerial Warfare," which appeared about a year ago. When the first edition was prepared in the early months of 1908, the most obvious and important practical use of airships, in the opinion of the writer, was in connection with war; and he attempted to show that their employment for such a purpose, by increasing the possibilities of the horrors of war, by "speeding up" the operations, and by adding to the uncertainty of the ultimate issue, would tend to cause pugnacious nations to think twice before making a formal declaration of hostilities.

The remarkable achievements in the year 1909 of the operators of both flying machines and dirigible balloons—Blériot's crossing of the English Channel; Latham's flight in the suburbs of Berlin; Comte de Lambert's run from Juvisy to Paris; the well-known exploits of the Wright brothers, and numerous other notable flights—greatly widened the scope of aeronautics and opened up numerous other possibilities in aviation which, a few months before, had been considered entirely fanciful. Consequently, Mr. Hearne was prompted to enlarge the contents of his original volume so that his work might show the practical bearings of airships upon the world's future development in times of peace, as well as their utility in times of war. To this end, seven new chapters have been added, in which the leading topics under consideration are the commercial uses of airships, the progress of aeroplane and dirigible balloon construction in 1909 and the new records made, the military trials of the Wright brothers, and the present-day airship fleets of the nations.

A considerable portion of the present second edition is given over to a discussion and elaboration of two ideas which seem to be uppermost in the mind of the writer, viz., that, since the coming of the petrol motor, some seven or eight years ago, aviation has made extraordinarily rapid strides; and that those nations which have given the most pecuniary and moral support to the development of the airship are the very ones which are applying this new arm most zealously to warlike purposes. He loses no opportunity, as occasion offers, to reprimand the government of his own country, England, for what he regards as too great conservatism in all matters pertaining to aviation, and he points out the dangers of such a policy, especially in view of the activities of her continental neighbors—France and Germany.

The book is written in rather a popular style and is designed to appeal to the "intelligent public"; hence it is, for the most part, free from technical discussions. Its value to the general reader is further enhanced by the inclusion of upwards of seventy well-chosen illustrations. An introduction by Sir Hiram S. Maxim discusses, among other important matters, the relative merits of the Wright and French machines, to the disadvantage of the latter notwithstanding their superior workmanship.

Leonard B. Spencer, for fifteen years in charge of the New York Aquarium, died in this city last Saturday, at the age of seventy-two.

The late Alexander Agassiz bequeathed to Harvard University all of the scientific equipment he had collected; $100,000 to the Harvard Museum for general uses, and $100,000 to be used in publishing memoirs of the United States Fish Commission's expedition in 1891, the Blake expedition of 1877-80, the tropical Pacific expedition of 1899-1900, and the Eastern expedition in 1904-05; to the library of the Lawrence Scientific School, his books on mathematics, chemistry, and physics; to the American Academy of Arts and Sciences, $50,000; to the National Academy of Sciences, $50,000, and to the city of Newport, 25,000, to be used by the manual training and scientific departments of the public schools. Harvard, it is said, has a reversionary interest under the will by which, in the event of the death without issue of any of Agassiz's children, and in the natural course of events, it will eventually receive at least a million dollars from the estate.

Drama.

THE LESSON OF THE STRATFORD FESTIVAL.

The programme of the annual Shakespeare Festival, which begins at Stratford-on-Avon to-morrow, is one of the most striking and encouraging theatrical documents that have been published in a long time, and suggests a few reflections on the general dramatic situation here and in England, and especially upon the true nature of a stock company and the substantial results that may be accomplished by even one such organization. All true lovers of the stage know, of course, that the American theatre, chiefly owing to a purely commercial and essentially vicious system of management, is, and long has been, in a degenerate state. The artificial manufacture of stars, the policy of long runs, the virtual elimination of wholesome competition and of the means of histrionic education, have had disastrous effect upon both playwrights and players. It is an old and familiar story. But there are signs here and there of coming changes, and of a possible regeneration. The number of syndicates is increasing, and the effect of growing rivalry must almost certainly be beneficial. The intrusion of the music hall into the dramatic field is welcome for the same reason. Another significant incident is the sudden realization by that astute theatrical strategist, Mr. Charles Frohman, of the virtues of the repertory theatre. Should he find profit in his experiment, he will not fail to repeat it, and any revision of his present policy would have far-reaching consequences.

The New Theatre in this city has furnished an impressive object lesson to a generation ignorant of the true scope and power of a permanent company, but cannot be said to have illustrated all the potential value of such a body. Thus far it has been stronger in suggestion than in fulfilment. It has demonstrated some of the virtues of the stock company, but not all, or the most important. What money can do, it has done. It has offered in rapid succession many plays of widely divergent types, in luxurious and appropriate setting, with casts of level excellence, and with admirable attention to all the minor but highly important details of stage management. But it is still engaged upon preliminaries, which ought to have been completed before the first performance was given. As yet, it possesses only the nucleus of a company. It is not yet a perfect, self-sufficient entity, equal to all the demands of its own programme. Until the day comes when it is no longer obliged to engage special performers for the most important parts in its productions, but is able to supply from its own members players capable of interpreting the most diverse and exacting characters—players trained and developed under its own direction—it cannot be rightfully regarded, or judged, as a stock company, with all that that title implies. There is no reason to doubt that it will become one in time. This is the end for which its directors are understood to be working. But not until it has assumed a more definite shape will it be possible to estimate its potency as a school of acting.

There are critics who hold that the importance of stock companies as training schools has been overrated. Upon them rests the burden of explaining why it is that the race of great actors, either in tragedy or comedy, gradually died out with the disappearance of those institutions, and how it happens that nearly all the really superior performers of to-day learned the rudiments of their art in similar establishments. The last of them vanished in this country with the death of Daly years ago, while in England there have been few of any consequence in the last generation. During that period there were two or three good stock houses in the provinces, and Irving once kept a good company to support himself and Ellen Terry. The companies maintained by Tree, Alexander, Bourchier, and other stars have had nothing in common with the stock principles and have been essentially unproductive. This is why the life work of Mr. F. R. Benson has been so extraordinarily important. Nothing in the theatrical world of England has been comparable with it since the famous reign of Phelps at Sadler's Wells. It is scarcely too much to say that he has done more for the cause of the poetic drama and of good acting than any other man of his time, Henry Irving not excepted. The latter did noble work, but, in turn, the personal motive was always dominant. Mr. Benson, never a great actor, has given all his best years to Shakespeare in a spirit of devotion to the poet and to his own profession. When he left Oxford, in the seventies, he organized what long ago became the best stock company in existence, although recruited mainly from amateurs; and ever since he has been acting Shakespeare up and down the land, winning renown in all the larger cities, and, at the last, appreciation in London. For twenty-four years he has directed the annual festival at Stratford, presenting, in that time, some thirty of Shakespeare's plays, and chiefly with his own performers. His representations, in which he himself plays many parts, are notable, not so much for brilliancy on the part of particular actors, as for their vigor, vitality, intelligence and full Shakespearean flavor. London managers were quick to discover that his company was an unfailing source of supply, whenever they were in need of a good actor, and have never hesitated to deplete his forces. Most of the rising young actors in London are ex-Bensonians, but he seems always able to fill his vacancies. His vindication of the stock-company principle is triumphant. He has created a school whose graduates need no other certificate of general acting proficiency than the proof of their service with him. Among them may be mentioned Oscar Asche, Henry Ainley, Mattheson Lang, Alfred Brydone, J. B. Fagan, Otho Stuart, Charles Quartermaine, E. Lyall Swete, and the lamented Weir.

There can be no doubt that his labors are bearing fruit. The Shakespeare Festival of Stratford, of which he is the inspiring genius, has now acquired an international fame. Shakespeare lovers can enjoy no such feast elsewhere. Sir Herbert Tree has paid it the compliment of imitation. The prominent London "stars" are eager to be associated with it. Among the performers this year are Tree, Bourchier, Waller, Martin Harvey, Ellen Terry, and Genevieve Ward, not to mention lesser lights. But the solid foundation is supplied by the Bensonians. The programme includes no less than sixteen of Shakespeare's plays, "The School for Scandal," "The Knight of the Burning Pestle" of Beaumont and Fletcher, and the prize play, "The Pip-

er," by the American poetess Josephine Preston Peabody. One day, the performances will be furnished by Old Bensonians exclusively, and there could be no more convincing evidence of the solidity of their founder's achievement. He has set an inspiring example and enforced a pregnant lesson, which is that the creation of actors is the first step towards a revival of the higher drama.

Brieux's "The Three Daughters of M. Dupont," which Laurence Irving has produced in the Comedy Theatre, is a clever, purposeful, and in some respects impressive, play, but deals with conditions so essentially French, and illustrates them in so extravagant a fashion, that it cannot be regarded as an especially valuable or timely addition to English stage literature. In offering a translation of it Mr. Irving shows praiseworthy respect for the author, but he might easily have made the piece more attractive and significant to English-speaking audiences by a little judicious adaptation. Even in France, where the *mariage de convenance* is favored both by law and custom, parental authority is not always callously indifferent to the personal inclinations of the contracting parties, nor are the results of such unions always disgraceful or tragic. On the contrary, domestic happiness is just as common in France as in any other civilized country. M. Brieux, like many other enthusiasts, weakens a good cause by overstating it, and trying to deduce a general rule from exceptional instances. His M. Dupont is the embodiment of cunning, tyrannical, hypocritical selfishness. One daughter, betrayed in early youth, he turned out upon the streets, with the inevitable consequences. The second, doomed to hopeless spinsterhood by his heartless greed, has become a withered devotee. The youngest, and prettiest, in the hope of a prospective legacy, he delivers into the hands of a notoriously heartless profligate, whom he deliberately cheats in making the bargain. Of such a marriage, of course, there could be but one issue, but in depicting the climactic quarrel between the young wife, maddened by the realization of her husband's grossness and her own degradation, M. Brieux breaks all the laws of artistic reticence and offends against good taste and probabilities. The violence in word and action in this scene would be excessive even in melodrama. After this the final reconciliation, with which the play ends, falls little short of the ridiculous. Such a tale would culminate more fitly in murder and suicide.

The Russian actress, Mme. Nazimova, furnished one more example of her great versatility when she appeared, in her new theatre here on Monday evening, as Rita Allmers in Ibsen's disagreeable play "Little Eyolf." Her impersonation, if it had little that was distinctively Norwegian or Ibsenian about it, was entirely distinct from either her Nora or Hedda, and as an exhibition of pure acting power was exceedingly striking. Her exact position in the artistic world cannot be determined until she has been tested in characters of more exacting quality than any of the eccentric or grotesque parts in which she has won her present reputation, but there can be no question that she has a positive genius in the invention of appropriate and effective pose and of delicate, varied, and illuminative by-play. She was applauded rapturously for some of her most elaborated effects—as in the passionate scenes with her husband, and her horror and collapse at the death of Eyolf—but it was in her periods of silence, when she was comparatively in the background, that some of her best work was done. Her denotement of her personal interest in the business of the scene, by the slightest facial changes or by apparently unconscious movements of the hands or fingers, is singularly subtle. She never drops out of her part for an instant, and her "business" shows great imaginative ingenuity. With each succeeding impersonation she confirms previous impressions of her rare abilities, but thus far she has only played supremely well in second-class characters. Until she gets clear of the Ibsen drama, which offers nothing beyond the capacity of the ordinary actor, it will be impossible to determine her exact standing as an actress.

Music.

TOO MUCH MUSIC?

Time was when, as soon as the opera season ended, concert givers rushed into the music halls like waters that had been held back by a dam. Nothing of the sort has happened this year; with the exception of Wüllner's farewell, on Tuesday of last week, which closed the musical year 1909-10, no concert of any importance has been given since the Metropolitan Opera Company, which outlasted the Manhattan by a week, closed its doors and departed for Boston and the West. Concerts are seldom as popular as operas; and, inasmuch as even the opera had been obliged, during its last few weeks, to rely on Russian dancers for most of its large audiences, the concert-givers wisely concluded that they had better hie them to Europe, where the season lasts four months longer than on this side of the Atlantic.

If the situation shows conclusively that New York has had too much music during the last six months, the musicians need not be alarmed, for the conditions were exceptional, and will not be the same next season. For three years this city was able to support two opera houses in addition to the usual number of concerts; trouble came when both the opera companies nearly doubled the number of their performances and the Philharmonic Orchestra at the same time gave considerably more than twice the usual number of concerts. Next autumn Mr. Hammerstein will have no extra Opéra Comique company, and Mr. Gatti-Casazza will not run opposition to himself by giving simultaneous performances at the Metropolitan and the New Theatre or the Brooklyn Academy. That will make a difference. The Philharmonic Society also has decided to reduce the number of its offerings by about a dozen. What with the concerts of the New York and Boston Symphony Orchestras, the Russian and Volpe bands, the multitudinous Sunday entertainments at the opera houses, the choral performances, and the recitals of singers, pianists, and violinists, there will still be more than enough. But there will be less of a glut in the operatic and orchestral branches, in which we have tried, during the past six months, to surpass all European cities, quantitatively as well as qualitatively, with somewhat discouraging results.

It should be borne in mind that the consequences of such overproduction would have been the same in London or Paris, Berlin or Munich. Tickets for extra concerts are hard to dispose of everywhere. As Mme. Schumann-Heink once remarked: "The music-lovers of the large German cities set aside a certain amount for concerts each season, and they attend the regular subscription series in their own towns, and won't spend a penny more for anything else."

Probably orchestral concerts not included in the regular subscription series would be better patronized if an effort were made to consult the taste of the public. *Vox populi* is not necessarily *vox dei*, nor is it necessarily vulgar, as professional prigs assume. At the opera houses public taste is studiously consulted, and it is borne in mind that there are audiences and audiences. Some want Luisa Tetrazzini in "Lucia" or "La Traviata," others want Mary Garden and Maurice Renaud in "Thaïs" or the "Jongleur," while still others are willing to pay, once or twice, to hear sensational novelties, like "Elektra" and "Salome." All these tastes are catered to.

This sensible and profitable method of feeling the public's pulse does not prevail in concert halls. On the contrary, the singers and players and the orchestral conductors seem to take a special delight in inflicting on the public precisely and persistently what it does not want. Cacophonists and mathematicians have the place of honor, while the melodious masters, whom the public desires to hear above all, are, for the most part, ignored. When "Pelléas et Mélisande" was first produced in this city, the prediction was made that its life would be short. It was given seven times that winter, three times this season, and that probably ends its career. The absence of melody (intentional in this case) killed it. In the realm of concert music the banishment of unmelodious works is less prompt because the programmes are usually mixed. Beethoven, Tchaikovsky, and Wagner thus help to float pieces that, unaided, would soon sink out of sight. It is significant that while nearly every programme has a Richard Strauss piece, no conductor dares to give a special Richard Strauss concert.

The public would infinitely prefer Johann Strauss to Richard; Wagner

agreed with Brahms in his ardent admiration of Strauss's waltzes, and Bülow urged their inclusion in symphony concert programmes. But "dignity" must be preserved, though the concert-halls remain empty. At the Paderewski recitals nothing arouses more enthusiasm than the Liszt rhapsodies. They have been admirably orchestrated, and if played at symphony concerts would do much to attract the public. Liszt's other works are too much neglected; so are the symphonic poems and symphonies of Saint-Saëns, and Dvorák's overtures and symphonies—melodious all, and beautifully colored. The "Peer Gynt" suites are second in popularity to no music ever written, and often played, but there are a dozen other works of Grieg's, equally beautiful and of the same popular character, yet never performed. The Brahms "Hungarian Dances" have not been played for years, nor Rubinstein's "Feramors" and "Nero" ballet music and his Bal Costumé, and Bizet's "L'Arlésienne" suites. In all these there is abundant melody. If the conductors put more of this kind of music on their programmes and the singers selected the melodious songs instead of the declamatory kind, the impression that too much music is offered to the public would soon disappear.

Some Musical Recollections of Fifty Years. By Richard Hoffman. New York: Charles Scribner's Sons. $1.50 net.

Richard Wagner in Bayreuth. Erinnerungen gesammelt von Dr. H. Schmidt und U. Hartmann. Leipzig: Carl Klinner.

When Mendelssohn's "Elijah" had its first performance, at the Birmingham Festival of 1846, under the composer's own direction, the organist was Dr. Gauntlet, and the stops were pulled out for him by a lad of fourteen, named Richard Hoffman, who, in the following year, emigrated to New York. He soon became one of its most eminent musicians, but none of the later honors made him feel so proud as the recollection of having taken a part, however humble, in that first performance of Mendelssohn's masterwork. The organist appears to have been somewhat refractory, for when the composer said to him, "Not so loud," and asked him to push in certain stops, Gauntlet asked the boy to pull them out again as soon as the other's back was turned. In his "Recollections," Richard Hoffman notes the odd fact that Mendelssohn would seldom beat more than the first sixteen or twenty-four bars of an overture or movement from a symphony. He would then lay down his bâton and listen, often applauding with the audience, and not beating time again until he wanted an acceleration or retarding of the pace, or some other effect not noted in the parts.

When Barnum brought Jenny Lind to the United States, in 1850, he engaged Richard Hoffman as pianist for the company. This not only gave him a prominence and experience that years of ordinary work would not have brought, but had a most salutary effect on his musical education, besides providing him with much interesting material for the "Recollections" relating to that great singer's art and diverse incidents. On one occasion Barnum hired the enormous hall over the Fitchburg Railroad Station in Boston. Even that was so crowded that the pianist, having by mistake used the main entrance, could not get out again and had to be lifted up and passed over the heads of the people till he reached the stage.

Among the other musicians with whom Mr. Hoffman became intimate were Thalberg and Gottschalk, both of whom devoted themselves almost entirely to their own compositions or arrangements, and wisely so. Many things were different in those days. Imagine the Philharmonic Orchestra serenading a popular prima donna on her arrival from Europe! That is what happened when Christine Nilsson first came over, in 1870. In that epoch, to be sure, serenading was not an unusual thing. A lover who wanted to pay the girl of his choice a delicate attention would engage a double quartet of male voices, or a brass band, to make music for her in the street after midnight. Mr. Hoffman has quaint things to tell also about Bülow's scrap book, Balfe's way of finding melodies, and many other things. In the appendix, there is an essay of his: "How to stimulate thought and attention in a pupil," which is worth reading. The first fifty-nine pages of this volume contain a biographic sketch by his widow, from which the following, relating to Hoffman's father, may be cited: "When he was seventy-five, I heard him play all the scales on the piano with remarkable velocity, and with a wine-glass full of water on the back of one hand, never spilling a drop, nor moving the glass."

Recollections of Richard Wagner during the ten years he lived in Bayreuth make up most of the book by Schmidt and Hartmann—not the reminiscences of artists, but of the humble town folk who helped the great composer build his villa, fill it with furniture and books, make the garden, and so forth. In the various anecdotes related we see him as a friend and protector of the poor, a lover of animals, an irascible, yet kind-hearted employer, a democratic citizen, a clubman who prefers solitude, an indulgent friend of bandmasters, and divers other things, including the digger of his own grave before his house was finished. Of particular interest are the details given by the bookbinder who helped him give his library the luxurious aspect on which so many eminent visitors have commented. Christian Senfft was his name, and the visitors carried his fame to all parts of Europe, so that he received orders from far-away cities like Vienna and St. Petersburg. He frankly admits that he owed his success largely to the hints given him by Wagner regarding colors and other details of decoration. Money was no object, $15 for binding a book being nothing unusual. For years Senfft was at Wahnfried nearly every day; not infrequently the composer would suddenly stop, strike some chords on the piano, jot down a few notes, and then resume the conversation.

The name of Anton Seidl appears often in these reminiscences; to him Wagner generally entrusted the rehearsing of special performances on social occasions, and also the making of excerpts from the Wagner dramas for the bands, which did much to familiarize the German nation with this new style of music. That Wagner composed six fanfares for one of the Bayreuth bands will be news to the best-informed of his admirers; it would be interesting to hear them. How he taught four trombonists to play the Grail motive in "Parsifal" is told in an instructive section, and other pages describe his joy over the new viola, invented by Hermann Ritter. In this case, another had provided the special tone quality he had desired; in others he had to invent it. On pp. 112 and 114 we read how he went to work to get the realistic tone he wanted for the ox-horn blown by Hagen in "Götterdämmerung," and how he made a prominent piano manufacturer construct a special instrument for the chimes in "Parsifal."

American composers are not the only ones who complain of being neglected in their own country. The Parisian publisher, Jacques Durand, has undertaken to give four Thursday evening concerts at which the best of the works printed by him are performed. Among the composers represented are Debussy, d'Indy, Dukas, Ducasse, Ravel, Louis Aubert, René Baton, and Saint Saëns, whose C minor symphony gave the impression of being the fountain head of contemporary French music.

Americans going abroad this summer will have a number of music festivals at their command. Munich, in particular, is making great efforts to attract tourists. Besides the usual Wagner and Mozart festivals in that city there will be concerts, on May 20-30, in commemoration of the centenary of Schumann's birth; a Beethoven-Brahms-Bruckner cycle of twelve "symphonic festival concerts" between August 5 and September 4; a Richard Strauss week, June 23-28; three festival concerts by the Vienna Philharmonic; first performance anywhere of Gustav Mahler's seventh symphony, under the composer's direction. Bonn will have a Schumann-Brahms festival on May 3, 4, and 5.

Julius Blüther, the famous German piano maker, died at Leipzig last week, at the age of eighty-six. He established his piano factory at Leipzig in 1854.

Art.

THE INTERNATIONAL.

London, April 8.

The International Society, left without a home by the closing of the New Gallery, has opened its tenth exhibition in the Grafton, and is not to be congratulated on its change of headquarters. Indeed, few events could better show how serious to London and to artists is the loss of the New Gallery. The Grafton is not half so well designed for the exhibiting of pictures, while it is not designed at all for the exhibiting of sculpture, and it must be remembered that the full title of the International is the International Society of *Sculptors*, Painters, and Gravers, and that its president is Rodin. Smaller examples of sculpture, of course, can be shown. As it is, a not over remarkable Torse de Femme by Rodin occupies the centre of the little Octagon Room devoted to prints and drawings. In another room the centre is filled by Harry Wilson's Sketch for a Monument, a tomb of imposing architectural proportions adorned by several figures, for which it would be impossible to make place were the monument finished, or even for the different details. A few bronzes, among them two ingenious little Danseuses, by Troubetzkoy, look well enough, scattered throughout the galleries, better certainly than set out in long tedious rows as at the old salon.

There can be no question that in another way the society disregards the obligations of its name, for the international element threatens to vanish with the years: a change for which the Society itself must be held responsible. It was at the beginning, actually as well as nominally, liberal enough to offer artists from abroad the same chances as artists at home, or better if they deserved it. The two Salons in Paris may throw their doors open to artists of every nationality, but the Royal Academy in London has never had much use for any work that is not "made in Great Britain," and the smaller societies, until the International set the example, were as insular. And now the International, as if forgetting that to this liberality it owed the chief interest and importance of its shows, has almost ceased to justify its name, and the artists of most foreign countries are conspicuous by their absence. From America the contributions are but few, and these few come mostly from Americans who at the present moment live on this side of the Atlantic: Pennell, who shows his Pittsburgh and New York etchings, which have already been seen at home; D. S. MacLaughlan, who also has a group of prints; Henry Muhrman, with the landscapes in pastel to which he knows how to give such solemnity and impressiveness; Miss Mary Cassatt, whose one picture, La Tasse de Thé, comes with a group of paintings by the French Impressionists, with whose work hers is now wholly identified. Direct from America there is nothing save a series of four wood-engravings by Henry Wolf, admirable reproductions, especially Whistler's Music Room and the portrait of Stevenson, and further notable as the only wood-engraving in the collection. Germany is virtually unrepresented, for the one notable picture by a German is the excellent and dignified portrait of Cardinal Gibbons by George Sauter, who for years has been a resident of London and a member of the Society's council. From Belgium and Holland, again nothing, except two or three landscapes by W. Bruckman, who, likewise, is a resident of London. From the Scandinavian countries, nothing. From Italy, nothing of note. From Spain, work by Zuloaga alone; but at least this is something to be thankful for. Certainly, if his three pictures are not of Zuloaga's best, they are among the most striking and suggestive from the living contributors to this year's International. There is nothing else as vigorous as his Poète Improvisateur Antonio Llanas, a full-length, life-size study of a Spanish peasant wrapped in a large cloak, bare-headed, a long shepherd's crook in his hand, posing against a landscape background, simple to the point of primitiveness, and under a sky put in with great swirls of the brush, which are so wholly out of keeping with the quiet, almost austere treatment of the rest of the canvas that they seem a bit of bravado to show what the painter could do had he a mind to. The color is sombre; reminiscences of Velasquez are in the type and in the modelling of the head, but the figure has not the spontaneity, the character, the "go" that is the charm of so many of his peasants and gypsies.

I have said nothing as yet of France because it is the one exception, the one country which does make some sort of a representation, and for which space is generously spared. Greater advantage might have been taken of this generosity. The French group is made up of the Impressionists who belong to an earlier generation and school and who have been seen often in London of recent years, and of a few of the more distinguished men of to-day, who, it is evident, have reserved their more important work for elsewhere, probably for the Salons. Only one picture here calls for mention. This is Manet's Ecce Homo, presumably the picture catalogued in M. Duret's book as Jésus Insulté, which was hung with the Olympia in the Salon of 1865, the ridicule both received from a bewildered public embittering Manet far more than even the laughter excited by his Déjeuner sur l'Herbe, a couple of years earlier at the Salon des Refusés. It does not strike one to-day as at all revolutionary; rather, it "smells" of the Louvre. In it, you feel, as in all Manet's religious pictures, the impersonal attitude of the painter. The subject seems to have been chosen by him because of its interest to the Old Masters, and the treatment seems an exercise in their manner that helps to justify Whistler's description of Manet as always "l'étudiant." But, then, how masterly is this exercise of the student, how fine the flesh tones, how real and living two of the figures, especially the one standing to the left so detached from the scene as to have the air of having been borrowed for the occasion and set down there for the mere pleasure of the painter in painting it! With all the criticism the picture invites, it, infinitely more than the Zuloagas, makes the surrounding work appear sadly lifeless and anæmic, and at the International becomes in its turn an Old Master.

As they are here represented, none of the French artists of later generations can dispute the ascendancy of Manet. Even the men of more independent schools are not as stimulating as often in the past. Vuillard has two studies that arrest attention by their ingenuity and their mastery of difficult problems. One shows a group engaged in a Partie de Dames, looked down upon from a height above; the other, a group round a table, seen in violent perspective. But neither has the beautiful feeling for his medium, for textures, for color, which he sometimes brings to the working out of his problems.

If the British members of the Society showed themselves so strong as to be able to stand alone, the weakening of the foreign element might be overlooked, though it would still be a serious mistake. But this year they cannot of themselves maintain the Society's originally high standard. It is astonishing, how little rises above the general average: one reason, perhaps, is that British members as well as French exhibitors have reserved their more important work for elsewhere. You must look in vain for even the eccentricity that, however absurd or affected or youthful, speaks of experiment or effort or thought. The collection is simply colorless. There is not a portrait of marked distinction. William Strang, who as vice-president occupies one of the chief centres of honor, fairly hurts by his sharpness of color and hardness of surface. William Nicholson could never err in this direction for his is a convention that makes for sobriety and refinement, but he is apt to rely more upon his convention than upon nature, and in his two portraits it has failed him. In the larger of the two, Portrait of Lady Pearson, the figure is placed in a vast expanse of canvas, no doubt to give dignity, but it takes a greater master than Nicholson to fill so large a

space when it is empty of pictorial incident. Velasquez could, and in his Meniñas the figures lose nothing in size and dignity because they occupy so small a proportion of the canvas, but then, no part of this canvas is empty, filled as it is throughout with atmosphere. Nicholson seldom suggests atmosphere. His portraits are usually decorative arrangements of flat spaces of color. As a consequence, on this huge canvas the figure is dwarfed, which is a pity, for the dress, the silk of the coat, the bunch of pinks stuck in it, the mass of white lace on the near table are all rendered with technical dexterity and delicacy. His other picture, The Conder Room, is an interior with two figures, something in the manner of his portrait group of Lord Plymouth and Family shown a year or so ago. But the figures have scarcely more life than the Conders on the wall. Nor is there any coherent design or scheme of color to bring the decorations of the room into harmonious or any other relation with its occupants. Charles H. Shannon has a portrait of a man so reticent in treatment that the veriest shadow of life in it would seem an impropriety. There is a vivid study of A Manda Lady, by Gerald Kelly. But the one painting of a figure subject that has any real character or force is by William Orpen: a record of something seen to which, as a concession to his Frith-like love of anecdote, he gives the title Living the Life in the West. What he means by this, or whether he means anything except to puzzle the critics, matters little. The merit of the work is in its cleverness as a statement of fact. On the far wall of a room, behind a table littered with papers and draperies and bottles, hangs a gilt-framed mirror reflecting the figure of a young man, evidently Orpen himself, and behind him a window with cool gray light falling through most skilfully painted green Venetian blinds. The values of the objects inside and outside the mirror are rendered with admirable truth. But, after all, it is no more than an amusing study, not a picture. Perhaps in saying this I explain why it tells so strongly at the International. The painter has seen his subject, unpictorial as it may be, for himself with eyes trained to see; he does not merely reëcho the statement of others, nor look for his facts through their eyes instead of his own.

With the landscapes again, one picture alone seems to rise above the average. This one exception is D. Y. Cameron's Marble Quarry, though, even as I write, I feel that I should qualify my praise. It does not show careful observation of fact when examined in detail. It suggests less an intimate and profound study than a vivid memory, carried away from a quarry actually seen, of the contrasting effects of strong shadow and strong light under a romantic sky, and of the picturesque value of machinery and men at work: a memory which, the painter afterwards essayed to realize on canvas without rectifying it by further research on the spot. It is more than a note or an impression, but its elaborate construction savors less of nature and of fact than of the studio. N. N.

A sale of the paintings, sketches, and studies of Carroll Beckwith, who is about to go to Rome, was held at the American Art Galleries, in this city, last week. The pictures sold included The Blacksmith, $300; The Golden Pool, $280; Dawn, $270; and Pastoral, $210. The entire lot of seventy-seven pictures brought $7,500.

An exhibition of thirty-six of the pictures of George B. Luks, at the Macbeth Galleries, in this city, shows that he is nothing if not versatile. Such a raw and drastic study as The Wrestlers would cause a shudder at every tea-pouring in Manhattan. On the other hand, long-haired lecturers will some day pounce upon the Whistlerian mystery and loveliness of The Little Gray Girl. He provides you with such masterpieces of characterization and beautiful painting as "The Duchess," The Old Clothes Man, The Little Milliner, and then produces a series of rather commonplace portraits, distinguished only by a certain probity of workmanship. What he has always is a wholesome love of his materials. He adores paint, plays with it, wrestles with it, scatters it royally upon his canvas. He makes all methods his as he needs them. He has been much praised for his sheer strength. It seems to the present writer his least valuable quality. What is precious in him is a quite tender and sympathetic quality, which takes him to the heart of certain things. Let us insist upon the important point that Mr. Luks is not a realist, except when he is on parade. His quality is visionary and imaginative. His defect is trusting his vision too little, and thinking too much of his biceps and his paint. What an extraordinary invention is Woman and Macaw. Three gorgeous birds stand, or dangle their scarlet, emerald, and lapis finery before an outer obscurity varied by the glitter of a wire net. Between the birds the rubicund vain face of a slatternly woman withdraws itself. What is remarkable spiritually is the juxtaposition of kindred human and animal types. If one cannot follow Mr. Luks in his Rabelaisian mood—and who cannot is to be pitied—one may enjoy him instead in these drastic yet sensitive portraits. In routine portraiture, Mr. Luks is very able. The canvas of E. W. Root, Esq., poised at full length in riding costume, is conventionally handsome. The likeness of Charles Fitzgerald, Esq., the art critic, is remarkably successful in suggesting a quizzically sensitive nature, less so in presenting the palpable effigy of the man. Equally full of character is the head of the writer W. H. Fraser, Esq. Mr. Luks is less satisfactory when dealing with surfaces than when dealing with souls. He is, we have been told, an *enfant terrible*—that awful thing a ruthless realist. He does take a pleasure in frightening timid people by occasionally wearing a horned mask. But look at that justly famous picture, The Spielers. Two ill-conditioned little girls waltz wildly towards you, glorified by the excitement of dance. All the light seems drained from the surrounding air by the flying blonde hair of the larger spieler. The thing is real, but of a transmuted reality. Mr. Luks's brain and heart have had more to do with it than his eye. Nothing is more stirring in the show than the stage scene from "I Pagliacci." Before such a picture there is no need to ask if Mr. Luks is a great painter. Whether he is a great artist or not is a more difficult question, the answer to which cannot as yet be given confidently.

Henry C. Frick has acquired Frans Hals's Portrait of a Woman, which was sold from the Yerkes collection to Knoedler & Co., the New York art dealers, last week, for $137,000, and has installed it in his Fifth Avenue residence in this city.

The National Academy of Design elected last week twenty-three new associate members, as follows: Painters: Robert MacCameron, Mrs. Charlotte B. Coman, Gardner Symons, William Ritchel, Thomas P. Anshutz, Ernest L. Blumenschein, Ralph Clarkson, Edward Dufner, W. Howe Foote, Daniel Garber, De Witt Parshall, W. Merritt Post, and Albert Sterner. Sculptors: Bela L. Pratt and John J. Boyle. Architects: Edmund M. Wheelwright, Robert S. Peabody, Henry J. Hardenbergh, John Galen Howard, Arnold W. Brunnen, Frank Miles Day, Wilson Eyre, and C. Grant La Farge.

Among the American exhibitors at the salon of the Société Nationale des Beaux Arts, opened in Paris last week, were James J. Shannon, Miss Elizabeth Nourse, Miss Florence Upton, Eugene P. Ullman, Myron Barlow, Frederick Frieneske, Miss Ethel Mars, and Julius Rolshoven.

Sir William Quiller Orchardson, R.A., painter of subject pictures and portraits, died last week in London. He had just finished for the coming Academy exhibition a portrait of Edwin Austin Abbey, the American artist. Mr. Orchardson was one of the most popular of modern historical, romantic, and dramatic painters. He was born in Edinburgh in 1835, went to London in 1863, and in the same year exhibited at the Royal Academy for the first time. In the following year he exhibited at the British Institution a figure of Peggy, from Allan Ramsey's "Gentle Shepherd," and at the Royal Academy another Scottish subject entitled Flowers o' the Forest. In 1865 there appeared at the Royal Academy one of the most successful of his Shakespearean illustrations, Hamlet and Ophelia, which was followed in the winter exhibition at the French Gallery, Pall Mall, by The Challenge, which won a prize of £100, given by Mr. Wallace. In 1866 came the striking Story of a Life, which attracted much attention at the Academy—an aged nun relating her life experience to a group of novices; and Christopher Sly, which was exhibited in Mr. Wallis's winter exhibition at the Suffolk Street Galleries. In January, 1868, Orchardson was elected an associate of the Royal Academy, only four years after his arrival in London. He achieved a great success at the Paris Universal Exhibition, where his Challenge and Christopher Sly were greatly admired by French critics, and won for the painter one of the very few medals awarded to English

artists. He was elected a Royal Academician in 1877, and a D.C.L. of Oxford in 1890. He was knighted in 1907.

Andreas Achenbach, one of the foremost of German landscape painters, died recently in Düsseldorf, at the age of ninety-four. When still a boy he became a pupil of Schadow, at Düsseldorf, where he became associated with his brother, Oswald. He painted chiefly the scenery of Holland and Scandinavia, and examples of his work are to be found in most of the important German collections.

Dr. Henry Thode, the German critic and art-historian, has retired from the position of lecturer on art at Heidelberg, which he has held for sixteen years.

François-Emile Ehrmann, the French painter of historical and classical subjects, died in Paris recently, at the age of seventy-six. He first exhibited at the Salon in 1863, and last year was awarded the Prix Estrade Delcors, valued at 8,000 francs, by the Académie des Beaux-Arts. Several of his designs were reproduced in Gobelin tapestries.

Finance.

AN UNSOLVED PROBLEM.

On Thursday of last week, the government gave out its report on the country's foreign trade in March. Public interest had centred mainly in the question whether that month, like its predecessor, would show the highly abnormal condition, for this country, of an excess of merchandise imports over exports. The March figures not only reported such a condition, but the excess of imports, $19,254,000, was very much the largest shown by any month in twenty years past, except April, 1897, March, 1893, June and July, 1890, and July, 1889.

As every one is aware, this "import excess" began in the three summer months last year; until May, 1909, no month in our history since June, 1897, had shown anything but a surplus of exports over imports. The first comparison, therefore, may profitably set the figures of recent months over against those of the two preceding years, within which time the increase in imports and the decrease of exports have reversed our monthly balance. In the subjoined tables, a monthly excess of exports is printed in ordinary Roman type; excess of imports in heavy figures:

	1910.	1909.	1908.
Jan...	$10,805,007	$53,136,341	$121,117,204
Feb...	**4,368,460**	7,398,208	83,004,381
Mar..	**19,254,613**	6,417,441	52,474,542
Apr...	.....	3,007,185	45,920,129
May..	.....	7,262,243	29,567,750
June..	.....	**7,245,540**	23,262,352
July..	.....	**3,151,402**	16,764,083
Aug..	.....	**7,342,187**	19,259,519
Sept..	.....	32,948,265	40,899,221
Oct...	.....	73,023,992	69,944,428
Nov..	.....	53,489,905	57,337,406
Dec..	.....	33,642,470	76,910,345

These three columns show by what stages the present status has been reached. The earliest monthly figure given—that of January, 1908—was the largest export surplus of any month in our history, before or since. Inasmuch as the five monthly import surpluses of 1909 and 1910 to date were the first that have been witnessed since 1897, it will perhaps be worth while to glance back across the intervening thirteen years. The three years which call for particular study under present circumstances are 1893, 1895, and 1897. This is the monthly record of those years—figures of an import excess again being printed in heavy type:

	1897.	1895.	1893.
Jan...	$42,597,865	$13,682,064	**$7,494,598**
Feb..	20,583,709	**2,333,247**	**12,770,254**
Mar...	10,930,803	**4,133,646**	**20,146,953**
Apr..	**23,673,620**	**3,494,317**	**17,140,355**
May..	**1,486,871**	**1,761,675**	**6,999,886**
June..	**11,989,987**	**6,694,214**	**4,247,975**
July..	17,429,209	**16,488,017**	**5,927,790**
Aug...	40,980,445	**15,131,324**	15,042,546
Sept..	62,111,786	**6,765,257**	25,726,186
Oct...	61,764,805	12,010,628	35,940,159
Nov...	64,317,674	23,967,764	42,396,335
Dec...	73,547,998	30,328,070	43,626,862

Now for the causes. During 1893, the turn in the monthly balance of trade was attributable both to a sharp decrease in exports and to a great increase in imports. Neither process was attributable to abnormally high commodity prices in this country. Prices, in fact, were low; but they were lower still in Europe. For this the reason was that industrial England particularly, and in a less degree the Continent, were suffering from the after-effects of the London Baring panic of 1890. The United States had at the time been little injured by that commercial setback; it was, therefore, not unnatural that Europe, in its prolonged spell of financial and industrial liquidation, should have bought less than usual from America and sold to us at lowered prices in constantly increasing quantities. From this double process came the months of "import excess" early in 1893.

The story of 1895 was different. Following our own panic of 1893, the United States had for more than a year indulged in close economy. With February, 1895, came a sudden change. The Belmont-Morgan syndicate artificially stopped gold exports from New York; the Treasury's depleted gold reserve was restored and protected; the government's credit was upheld. A burst of optimism followed in every market, the rise on the Stock Exchange being followed by rapid and continuous marking-up of prices for practically every commodity of production and manufacture, and for foreign goods as well. But the advance in commodity prices was very much overdone. European commodity markets did not rise with ours; therefore we lost the international trade. Farmers held back their wheat until Russia had satisfied the international demand; merchants had stocked up heavily, not only with domestic but with foreign goods, in the belief that old-time normal conditions had been restored. The result was a considerable shrinkage in the monthly export trade, and so abnormally rapid an expansion of our imports that the balance was again reversed.

Still different was the history of 1897. People who watched the foreign trade movement at that time were at no loss to explain it. The Dingley tariff, with its great increase in import duties, was to go into effect by July; seeing the drift of things, merchants made haste to get in foreign merchandise before the new duties were clapped on. In April, 1897, imports increased $42,000,000 over the year before; in May, $22,000,000, and in June, $28,000,000. This was a more violent expansion in imports than last month's; it was bound to reverse the monthly balance of trade.

It may be left to the observant reader to determine which of these three years, with their divergent conditions, the present season most resembles. What will perhaps be more immediately interesting is to show how the country, on each of the three occasions, once more restored its normal international balance. In 1893, a violent shock, with a season of prolonged and forced liquidation, was the course pursued; it was a thorny path. In 1895, no panic followed, but a general, rapid, and substantial reduction of prices on home commodity markets had the double effect of checking the abnormal importations and eventually restoring the normal export trade. The "import excess months" of 1897 had no ulterior result, except perhaps to curtail proportionately the import trade in the two or three months after the tariff law had gone into force. Before the autumn season had begun, the whole situation had been changed by the European harvest failure of 1897, the great American wheat crop, and the rise in our grain exports to unparalleled magnitude. Even in 1897 as a whole, excess of exports footed up $357,000,000; in 1898, it had risen to $620,000,000.

Henry Holt & Company 34 W. 33d New York

Orpheus

A General History of Religions

By SALOMON REINACH, Author of "Apollo," etc.

8vo, with Colored Frontispiece, $3.00 net.

"The volume gives ample proof of that wide erudition which we expect from this author. . . . The stylo of the book is delightfully epigrammatic. . . . Beginning with theories of anthropology and myth, M. Reinach states with persuasive skill many debatable dogmas. . . . He generalizes with all the grace of an accomplished English scholar. . . . The bibliographies testify to the wide range of the author's investigations."—*London Athenæum.*

YELLOWSTONE PARK A new 1910 Booklet in Colors, Free

The "Wylie Way" in Yellowstone is the highest expression of the art of camping—the result of 27 seasons' actual experience. Each permanent camp an ensemble of pine-embowered tent-cottages, every tent framed, *floored* and *heated*. Cozy sanitary camps, dry, bracing air, comfortable transportation and stupendous scenery—all making the "Wylie Way" the outing experience of a lifetime. Six day tours (or longer) start daily, June 14th to September 15th, from both Park Gateways. Wylie's four-color cover, beautifully illustrated 1910 handbook is of compelling interest to travelers. Free. Address

"WYLIE WAY"

VOL. XC.—NO. 2339. THURSDAY, APRIL 28, 1910 PRICE TEN CENTS.

SOME NOTABLE SPRING PUBLICATIONS OF CHARLES SCRIBNER'S SONS

CONTEMPORARY TOPICS

The Indian and His Problem

By FRANCIS E. LEUPP

For four years Commissioner of Indian Affairs

$2.00 net; postpaid, $2.20.

"No clearer statement of the case has ever been presented to the American public.

"Mr. Leupp's book is highly entertaining from beginning to end, apart from its intrinsic power as a contribution to the Indian question. He surveys the field broadly, and yet touches it in detail, drawing from his official experience for illustrations and examples to demonstrate his larger propositions. He gets down to the fundamental basis at every point."—*The Washington Evening Star.*

Promenades of an Impressionist

By JAMES HUNEKER

$1.50 net; postpaid, $1.65.

Here the author of "Egoists," etc., deals in his brilliant, subtle way with Cezanne, Rops, Monticelli, Rodin, Degas, Sorolla, and the like.

"We have many writers on art subjects in these days, but none so suggestive as Mr. Huneker. After reading any of his sketches, one is seized with a burning desire to see the pictures he describes, and that is about as great a compliment as could be paid to any critic."—*The Philadelphia Inquirer.*

"It is a companionable book, full of strange and unexpected learning that is without a suggestion of pedantry. It ought to find its way into the baggage of many lovers of culture when they invade Europe this year."—*The New York Evening Sun.*

Privilege and Democracy in America

By FREDERIC C. HOWE

Author of "The City, The Hope of Democracy," "The British City, The Beginnings of Democracy."

$1.50 net; postpaid, $1.65.

"Distinguished by its acuteness of historical observation, its truth of premise, its logic of deduction, and its clearness of diction."—*Washington Herald.*

"Mr. Howe's book is an earnest and thoughtful contribution to the discussion of present social and economic disturbances, of which the increased cost of living is a pressing and obvious manifestation."—*N. Y. Globe.*

FICTION

The Taming of Red Butte Western

By FRANCIS LYNDE

A Romance of Railroading by a Former Railroad Man.

Illustrated. $1.50.

"The story moves swiftly from the beginning, and the action grows in intensity and strenuousness as the story progresses. It is one of those tales that grip from the first paragraph. Mr. Lynde's earlier tales have given his readers a taste of his quality, and they will find there is no lessening either in interest or originality in this new story of romance and adventure from his pen. It is the sort of story that needs just the background he has given it; a setting where civilization almost merges into primeval barbarism. It is a satisfying tale."—*The Brooklyn Eagle.*

Little Aliens

By MYRA KELLY

Illustrated. $1.50.

Here for the last time the children of the East Side, with their queer notions, and their picturesque manner of talk, are made to live in print.

"Every one of the eight stories is an absorbing and appealing human document."—*Philadelphia North American.*

"Perhaps one of the largest counts in the debt which we owe to Myra Kelly is the revelation which she has given us of the fashion in which these "Little Aliens"—"alien to every American custom, and prejudiced by religion and precept against most of them," look at the life which they are to share in the future. She has interpreted them for us—made it possible for us to look at things somewhat from their angle of vision. The understanding with which these children are presented, and the insight which these revelations give, amount to absolute genius. It intensifies the sense of loss when it is realized that this interpreter will translate no more for us."—*The Brooklyn Eagle.*

The Head Coach

By RALPH D. PAINE

Illustrated. $1.50.

A novel of love and athletics that throws a brilliant light on the two great college problems of to-day—those of the Fraternity and Foot-Ball.

It is the romantic story of a young clergyman—of his fight for clean sport and straight foot-ball in a down-East college where, with his splendid record as a former Yale centre, he acts as Head Coach; of his equally absorbing fight against odds in winning the girl he loves.

Predestined

By STEPHEN FRENCH WHITMAN

$1.50.

"Excluding the works of these masters (William Dean Howells and Henry James) we are of the opinion that this is the most important book of the sort written by an American in the last twenty years."—*N. Y. Evening Sun.*

"From every point of view, it is one of the most interesting pieces of fiction produced by an American in many years."—*Collier's Weekly.*

IMPORTANT NEW BOOKS

Introduction to Economics

By ALVIN S. JOHNSON, Ph.D., University of Texas. 416 pp. *$1.50*

"An illuminating presentation, in brief and compact form, of the leading results of modern economic analysis."—Prof. T. N. Carver, Harvard University.

The Mechanics of Writing

By E. C. WOOLLEY, Ph.D., University of Wisconsin. 427 pp. *$1.00*

"The clearest and most practical guide to paragraphing and punctuation that can be recommended to students."

Study Book in English Literature

By E. R. HOOKER, A.B., formerly of Vassar College. 324 pp. *$1.00*

"Fills a peculiar and long-felt want. In its particular province it is quite as distinctive and helpful as Woolley's Handbook of Composition."—Prof. A. H. Espenshade, Pa. State College.

How We Think

By JOHN DEWEY, Ph.D., Columbia University. 230 pp. *$1.00*

"A concise exposition of the scientific attitude of mind and of the means of attaining it."

D. C. HEATH & CO., Publishers

BOSTON NEW YORK CHICAGO

THE ART OF LIFE SERIES

EDWARD HOWARD GRIGGS, Editor

"THE aim of this series of brief books is to illuminate the never-to-be-finished art of living. There is no thought of solving the problems or giving dogmatic theories of conduct. Rather the purpose is to bring together in brief form the thoughts of some wise minds and the insight and appreciation of some deep characters, trained in the actual world of experience but attaining a vision of life in clear and wide perspective. Such books should act as a challenge to the reader's own mind, bringing him to a clearer recognition of the problems of his life and the laws governing them, deepening his insight into the wonder and meaning of life and developing an attitude of appreciation that may make possible the wise and earnest facing of the deeps, dark or beautiful, in the life of the personal spirit."—*From the Editor's Introduction to the Series, printed in full in "The Use of the Margin."*

VOLUMES NOW READY:

LATTER DAY SINNERS AND SAINTS.
By Edward Alsworth Ross.
HUMAN EQUIPMENT.
By Edward Howard Griggs.
THE USE OF THE MARGIN.
By Edward Howard Griggs.
WHERE KNOWLEDGE FAILS.
By Earl Barnes.
THINGS WORTH WHILE.
By Thomas Wentworth Higginson.
SELF-MEASUREMENT.
By William De Witt Hyde.
PRODUCT AND CLIMAX.

Engineering Descriptive Geometry.

A Treatise on Descriptive Geometry as the Basis of Mechanical Drawing, Explaining Geometrically the Operations Customary in the Draughting Room. By F. W. BARTLETT, Captain, U. S. Navy, Head of Department of Marine Engineering and Naval Construction at the United States Naval Academy, and THEODORE W. JOHNSON, Professor of Mechanical Drawing, United States Naval Academy. 8vo, vi+159 pages, 137 figures. Cloth, $1.50 net. *July.*

The Sources and Modes of Infection.

By CHARLES V. CHAPIN, Superintendent of Health, Providence, R. I. Large 12mo, cloth. *July.*

Ore Mining Methods.

A Description of Methods of Mining Ore as Employed in the Mines of the United States. By WALTER R. CRANE, Professor of Mining and Dean of the School of Mines of the Pennsylvania State College. 12 figures in the text and 50 plates. 8vo, cloth. *May.*

The Optical Properties of Crystals.

Including a General Introduction to Their Physical Properties, with 121 figures in the text and 2 colored plates. Being selected parts of the *Physical Crystallography*. By P. GROTH, Professor of Mineralogy and Crystallography in the University of Munich. Translated (with the author's approval) from the Fourth Revised and Augmented German Edition, by B. H. JACKSON, M.E., M.A. 8vo, cloth. *June.*

Dust Preventives and Road Binders.

By PREVOST HUBBARD, Assistant Chemist, Office of Public Roads, U. S. Department of Agriculture; Secretary of the Committee on Road Materials, American Society for Testing Materials. 8vo, cloth. $3.00 net.

Introduction to the Analysis of Drugs and Medicines.

An Elementary Handbook for the Beginner. By BURT E. NELSON, Laboratory of the Binghamton State Hospital, and Chemist to the New York State Hospitals, the Department of Health, Board of Water Commissioners, etc. 12mo, cloth. $3.00 net.

Sewage Disposal.

By L. P. KINNICUTT, Professor of Chemistry, Worcester Polytechnic Institute, CHARLES EDWARD A. WINSLOW, and R. WINTHROP PRATT, formerly Chief Engineer, Ohio State Board of Health. 8vo, cloth. $3.00 net.

Lectures on the Theory of Elliptic Functions.

By HARRIS HANCOCK, Professor of Mathematics in the University of Cincinnati. Volume I, Analysis. 8vo, xxiii+498 pages, 76 figures. Cloth, $5.00 net.

The Theory and Practice of Modern Framed Structures.

Designed for the Use of Schools and for Engineers in Professional Practice. By the late J. B. JOHNSON, C.E., C. W. BRYAN, C.E., Manager of the American Bridge Company, and F. E. TURNEAURE, C.E., Dean of the College of Mechanics and Engineering, University of Wisconsin. In three parts. Part I, Stresses in Simple Structure. Ninth edition rewritten. Total issue twelve thousand. 8vo, xii+326 pages, illustrated with cuts throughout the text. Cloth, $3.00 net.

Laboratory Notes on Industrial Water Analysis.

A Survey Course for Engineers. By ELLEN H. RICHARDS, Instructor in Sanitary Chemistry, Massachusetts Institute of Technology. Second edition, revised with additions. 8vo, iii+56 pages. Cloth, 50 cents net.

Practice and Theory of the Injector.

By STRICKLAND L. KNEASS, C.E., Member of the American Society of Mechanical Engineers. Third edition, revised and enlarged. 8vo, iv+175 pages, 53 figures. Cloth, $1.50.

Studies in Immunity.

By Professor PAUL EHRLICH, Privy Councilor and Director of the Royal Institute for Experimental Therapy, Frankfurt, Germany, and by his Collaborators. Collected and Translated by Dr. CHARLES F. BOLDUAN, Bacteriologist, Research Laboratory, Department of Health, City of New York. Second edition, with new studies. 8vo, xi+712 pages. Cloth, $6.00.

Analytical Chemistry.

By F. P. TREADWELL, Ph.D., Professor of Analytical Chemistry in the Polytechnic Institute of Zurich. Translated (with the author's permission) by WILLIAM T. HALL, S.B., Instructor in Chemistry, Massachusetts Institute of Technology. In two volumes. Vol. II, Quantitative Analysis. Second American edition, thoroughly revised. 8vo, xii+654 pages, 96 figures. Cloth, $4.00.

High Masonry Dam Design.

By CHAS. E. MORRISON, C.E., Ph.D., Asso. Mem. Am. Soc. C.E., formerly Instructor in Civil Engineering at Columbia University, N. Y. City, author of "Highway Engineering," and ORRIN L. BRODIE, C.E., Asso. Mem. Am. Soc. C.E., Asst. Designing Eng., N. Y. Board of Water Supply. 8vo, iv+103 pages, 19 figures. Cloth, $1.50 net.

The Speed and Power of Ships.

By D. W. TAYLOR, Naval Constructor, U. S. Navy.

A Manual for Assayers and Chemists.

By W. H. SEAMON, B.S.A., Chemist and Metallurgist, formerly President and Professor of Mining and Metallurgy, New Mexico School of Mines. Small 8vo, cloth.

Catechism of Manual of Guard Duty.

By WYATT O. SELKIRK, 1st Lieut. Coast Artillery, U. S. A. 32mo, morocco.

Track Formulae and Tables.

By SHELBY S. ROBERTS, University of Illinois. 16mo, morocco.

Elementary Mechanics for Engineering Students.

By F. M. HARTMANN, Cooper Union.

Sewerage.

The Designing, Construction, and Maintenance of Sewerage Systems. By A. PRESCOTT FOLWELL, Editor Municipal Journal and Engineer. Sixth edition, revised and enlarged. 8vo. Cloth, $3.00.

Synthetic Inorganic Chemistry.

A Laboratory Course Illustrating the Methods and Principles involved in the Preparation of Typical Inorganic Substances, with Study Questions and Supplementary Experiments. Arranged for First-year College Students. By ARTHUR A. BLANCHARD, Ph.D., Instructor in Inorganic Chemistry, Massachusetts Institute of Technology. Second edition, revised. 12mo, viii+151 pages. Cloth, $1.00 net.

Descriptive Geometry.

By G. F. BLESSING, Swarthmore College, and LEWIS A. DARLING, M.E. 8vo. Cloth.

Outlines of Organic Chemistry.

A Book Designed Especially for the General Student. By F. J. MOORE, Professor of Organic Chemistry, Institute of Technology, Boston, Mass. Large 12mo, cloth. $1.50 net.

NEW BOOKS WORTH KNOWING

GILLETTE'S VOCATIONAL EDUCATION

By JOHN M. GILLETTE,
Professor of Sociology, University of North Dakota.

$1.00

An illuminating discussion of the training courses needed to meet the practical demands of life. The author explains the principles, demands, and methods of vocational education, and indicates actual results gained thereby.

COLLITZ'S SELECTIONS FROM EARLY GERMAN LITERATURE

By KLARA HECHTENBERG COLLITZ, Ph.D., formerly of the Department of Germanic Philology in Smith College and in Oxford University.

$1.00

Contains representative specimens of Old and Middle High German, given in modern German translations which present the form, spirit, and meter of the originals. Preceded by historical and explanatory paragraphs, and followed by literary references.

THOMAS'S MANUAL OF DEBATE

By RALPH W. THOMAS, A.M.,
Professor of Rhetoric and Public Speaking, Colgate University.

80 cents.

A practical manual for the beginner, presenting all the material required by the student, and telling him just what to do step by step. Enough of the theory of logic and argumentation is given.

LAMB'S SELECTED ESSAYS OF ELIA

Edited by JOHN F. GENUNG,
Professor in Amherst College.

40 cents

This, the most recent of the Gateway Series of English Texts, contains fifteen of Lamb's best essays, with appended helpful notes, and an introduction treating of Lamb's life, interests, and personal traits, with special reference to their relation to his writings.

SMITH'S PLANE GEOMETRY DEVELOPED BY THE SYLLABUS METHOD

By E. R. SMITH,
Head of Department of Mathematics, Brooklyn Polytechnic Preparatory School.

75 cents

Teaches the pupil to work out the proofs of geometry, rather than merely to memorize them. It leads to logical, accurate habits of thought, and renders geometry a live and interesting study.

VALERA. PEPITA JIMÉNEZ

Edited by C. V. CUSACHS,
Professor of Spanish at the United States Naval Academy.

90 cents

A carefully annotated edition of this charming novel, suited for reading in the second and third years. The complete vocabulary covers the author's special use of words.

HOLZWARTH. GERMAN LITERATURE, LAND AND PEOPLE

By FRANKLIN J. HOLZWARTH, Ph.D.,
Professor of the Germanic Languages and Literatures, Syracuse University.

$1.00

Shows in a concise manner how German thought and character have developed. Following a description of the early German civilization and history, comes a sketch of the literature, with outlines of the great works.

MORGAN'S ADDRESSES AND ESSAYS

By MORRIS H. MORGAN,
Late Professor of Classical Philology, Harvard University.

$1.50

Professor Morgan's last published work, representing his experience and views in fields in which he made distinct contributions. The contents are literary, linguistic, and archæological, and will prove of interest to every student and teacher of the classics.

MARTIN'S FRENCH VERB

By LIEUTENANT CHARLES F. MARTIN,
Instructor in Modern Languages, U. S. Military Academy.

$1.25

Shows the student how to use the French verb at the same time that he learns how to conjugate it. Complete conjugations of all types of French verbs are given, and their idiomatic use is fully illustrated.

FOWLER & WHEELER'S GREEK ARCHAEOLOGY

By HAROLD NORTH FOWLER, Professor of Greek, Western Reserve University, and JAMES RIGNALL WHEELER, Professor of Greek Archæology and Art, Columbia University.

$2.00

A concise yet complete handbook on the subject, comprising 559 pages, with 412 carefully chosen illustrations. It is equally adapted for college classes, private readers, or public libraries.

MAIRET. LA PETITE PRINCESSE

Edited by EDITH HEALY.

35 cents

A simple and interesting story for beginners. The vocabulary is complete, and following each chapter are conversational questions in French, and English exercises for translation into French.

CONANT'S PLANE AND SPHERICAL TRIGONOMETRY WITH TABLES

By LEVI L. CONANT, Ph.D.,
Professor of Mathematics, Worcester Polytechnic Institute.

$1.20

Combines scientific accuracy with practical usefulness. The material given has been thoroughly tested in the class-room. The proofs of the formulas are as clear and intelligible as they are rigorous.

OUR NEW 1910 CATALOGUE OF HIGH SCHOOL AND COLLEGE TEXT-BOOKS WILL BE SENT TO ANY TEACHER ON REQUEST

AMERICAN BOOK COMPANY

NEW YORK CINCINNATI CHICAGO BOSTON

Methods in Plant Histology

By CHARLES J. CHAMBERLAIN

Second edition, revised and much enlarged; 272 pages, with 88 illustrations, 8vo, cloth; net $2.25, postpaid $2.39

The first complete manual to be published on the subject of botanical micro-technique. It contains detailed directions for collecting and preparing plant material for microscopic investigation, setting forth the advantages and disadvantages of the different methods.

"Will no doubt find a place in every well-regulated library, and will be found very useful by private students."
—*Plant World.*

"It is an excellent book for the individual worker and for classes in colleges."—*Education.*

A Laboratory Guide in Bacteriology

By PAUL G. HEINEMANN

158 pages, interleaved with 37 illustrations, 12mo, cloth; net $1.50, postpaid $1.61

A clear and concise presentation of bacteriological technique, designed principally as a manual for the medical student, but highly useful also as a reference book for the biological teacher and investigator, as well as for practical workers in the fields of medicine and hygiene.

"The instruction given is clear and accurate, and the practical exercises are well selected."
—*The Lancet (London).*

"A book such as this must facilitate very greatly the practical class work, for which it is most excellently adapted."—*American Journal of Medical Sciences.*

"The directions are clear and concise, and every stage is described so carefully that it is hard to see how the student can go astray. Physicians who are rusty in bacteriology cannot do better than buy this little book. The book is beautifully printed and bound."
—*American Journal of Clinical Medicine.*

Animal Micrology

Practical Exercises in Microscopical Methods

By MICHAEL F. GUYER

250 pages, 8vo, cloth; net $1.75, postpaid $1.88

The title of this book will explain its scope. It is intended as a laboratory manual for textbook use. Its aim is to introduce the student to the technique of microscopic anatomy and embryology, emphasizing details of procedure rather than descriptions of reagents or apparatus. Sufficient account of the theoretical side of microscopy is given to enable the student to get satisfactory results from his microscope.

"The directions are simple, explicit, and complete."
—*American Journal of Clinical Medicine.*

"The medical student will find it very useful as a guide to microscopic work."
—*Journal of the American Medical Association.*

"This is one of the cleanest works on microscopical technique we have ever seen, and is especially suitable for the beginner. It is full of points, tricks of technique not mentioned in other works, and is one that every student and physician should have."—*Medical Century.*

"This valuable book is strong through its rigid exclusion of the trite and the conflicting. It is lucid and helpful, because a man long practised in practical work has given what he believes the most expeditious and reliable method of obtaining a definite and comprehensive result."
—*Medical Notes and Queries.*

"A concise, eminently practical, and well-classified treatment."—*Science.*

"The expositions of the methods recommended are admirably clear."—*Nature.*

"One of the best and most practical works upon microscopic technique with which we are acquainted."
—*American Naturalist.*

"As a text-book it can hardly be improved. The research worker will find in this book just the information he frequently needs in preparing material with which he is not familiar."—*School Review.*

"It does present in very clear form a judicious selection of methods, including an excellent untechnical account of the microscope and its optical principles, adequate for the undergraduate course in histology."
—*Journal of Comparative Neurology and Psychology.*

ADDRESS DEPARTMENT 21

THE UNIVERSITY OF CHICAGO PRESS

CHICAGO NEW YORK

New Books for Students

A Study of the Drama

By Brander Matthews, Professor of Dramatic Literature in Columbia University. *Students' Edition.* $1.25 *net.* Postpaid.

This book is a comprehensive treatise on the drama, embodying the results of the latest thought and investigation. Following the history of the theatre, ancient, mediæval, and modern, it discusses the drama's growth and development, and its fundamental laws and principles as revealed in the plays of the great dramatists from Sophocles to Ibsen. There are illustrations from plans and views of famous theatres, and an appendix containing subjects for study and bibliographical references.

A Student's History of American Literature

By William E. Simonds, Professor of English Literature in Knox College, Galesburg, Illinois. Crown 8vo, $1.10 *net.* Postpaid.

From the earliest colonial attempts at literature down to the very latest noteworthy novel, the author has traced with care and judgment the outlines of our literary history Chronological tables, suggested readings, and portraits and other illustrations, combine to make this one of the best student's handbooks in its field.

The Principles of Education

By William C. Ruediger, Ph.D., Assistant Professor of Educational Psychology, Teachers College, George Washington University. $1.25 *net.* Postpaid.

This book gives a statement of what a teacher's training should be, discusses the function of the school, explains the aims of education as presented by different authorities, and defines the value of various educational agencies. It will be found thoroughly practicable as a text book in college and normal school.

Riverside Literature Series

The Second Shepherd's Play, Everyman, and Other Early Plays

Edited by Clarence Griffin Child, Professor of English in the University of Pennsylvania.

Riverside Literature Series No. 191. Paper, 30 cents; linen, 40 cents, *net.* Postpaid.

The editorial equipment contains a general introduction, special introductions to the different plays, and explanatory and critical notes.

Mrs. Gaskell's Cranford

Edited with complete introduction, notes, questions, and suggestions, by H. E. Coblentz, head of the English Department, South Division High School, Milwaukee.

Riverside Literature Series No. 192. Paper, 30 cents; linen, 40 cents, *net.* Postpaid.

The editor, well known as a teacher and literary critic, has had the unusual advantage of a recent visit to Knutsford, which is the Cranford of the story. Photographs of the town of Knutsford add interest.

A Translation of the Æneid of Virgil

By Theodore C. Williams, formerly Head Master of the Roxbury Latin School. Riverside Literature Series No. 193. Illustrated. Linen, 75 cents *net.* Postpaid.

The editorial equipment includes a synopsis of the story, an introduction on the "poet and the poem," questions on the text, suggestions for reading, books for reference, famous lines, and a pronouncing vocabulary of the proper names in the poem.

Selections from Irving's Bracebridge Hall

Edited by Samuel Thurber, Jr., head of the English Department, Technical High School, Newton, Mass.

Riverside Literature Series No. 194. Paper, 15 cents; linen, 25 cents, *net.* Postpaid.

Teachers of English in technical and commercial high schools will find this edition unusually well adapted to their students. The introduction, explanatory notes, and questions have been prepared with particular regard to such use.

Thoreau's Walden

Edited by Francis H. Allen, author of a Bibliography of Henry David Thoreau, with questions by Charles Swain Thomas, head of the Department of English, Newton (Mass.) High School. Riverside Literature Series No. 195. Triple number. Illustrated. Paper, 45 cents; linen, 50 cents, *net.* Postpaid.

The editorial equipment contains an excellent characterization of Thoreau, full explanatory notes, and complete questions which will greatly assist in the interpretation of this nature classic.

Sheridan's The Rivals

Edited by Joseph Quincy Adams, Jr., Assistant Professor of the English Language and Literature in Cornell University. Riverside Literature Series No. 196. Illustrated. *In press.*

This text is the first accurate reproduction of the rare First Edition (1775) which, since no manuscript exists, and since Sheridan himself prepared it for the press, is the only authentic version of the play. The Introduction gives a biographical sketch of Sheridan, and an historical and critical account of *The Rivals.* There are explanatory notes.

BOOKS OF PERMANENT VALUE

NEW BOOKS

Long—English Literature

12mo, cloth, 582 pages, illustrated, with frontispiece in eleven colors, $1.35.

"I think it, upon the whole, the best textbook on English Literature I have ever met with."—*Hiram Corson, Emeritus Professor of English Literature, Cornell University.*

The New Hudson Shakespeare

Introduction and Notes by HENRY N. HUDSON; Revised by E. CHARLTON BLACK, with the Coöperation of ANDREW J. GEORGE. Each volume, 50 cents.

It has been said by one in authority that "within the compass of pocket volumes no edition of Shakespeare gives so much valuable and critical matter, arranged with effectiveness and distinction," as "The New Hudson Shakespeare." The cheery red cover and the clearness of the footnotes make the books especially attractive to younger students.

The following volumes are now ready, and it is planned to issue others at the rate of one a month.

The Nation.

NEW YORK, THURSDAY, APRIL 28, 1910.

The Week.

We are tempted to ask of what use it is to have opinions, when we see it stated that President Taft, while opposed to the bill creating a retired list for all surviving volunteer officers, will not go so far as to veto it. He regards it, so the story runs, as nothing but an attempt to catch the old-soldier vote at the coming elections, and as a wholly unnecessary drain upon the Treasury—but he will not veto it. It will cost $9,264,012, in addition to present pensions awarded to the prospective beneficiaries—but Mr. Taft will not veto it. Why not, Mr. Taft? Is it fear of the elections? Then let us suggest to the President a study of Mr. Cleveland's Administration. Does he know that Mr. Cleveland read every pension bill that came before him; that his wholesale vetoes of unworthy pension bills did more than anything else to convince the country of his downright honesty and devotion to the public welfare? Mr. Taft's friends are most eager for him to recover his lost ground. We suggest a vigorous use of the veto as an easy and highly desirable road to public favor. And nothing calls for a veto more loudly than this scandalous raid upon the Treasury by the pension-grabbers.

"The chief difficulty among Senators on the other side," said Senator Bailey in the debate on the railway bill last Friday, "is one of nice distinctions as to how they shall comply with party platforms. If that is to be the rule, there will be no need for Senators of wisdom, ability, and learning." Irrespectively either of its application or of its source, the point is well taken. There are two kinds of fidelity to party pledges. One comprises the fulfilment of the broad purposes to which the party has been clearly committed, and the carrying out of such specific promises in the platform as were the embodiment of intentions deliberately arrived at and known to be part of the party's programme. The other kind of fidelity consists in taking the platform, plank by plank, and undertaking a literal compliance with its language, as though it were a contract. The first kind is right and wise, the second kind flies in the face of the most elementary principles of statesmanship. To pursue it would mean to make the result of a twenty-four-hour discussion, engaged in by a group of men who have been selected for a few days' service and who have never before been associated in a common work, conclusive as to the policy of the national government for four years. Everybody knows that the platform is a variegated affair, some parts of which are to be taken at their face value and others not. It is a rough guide to the voters, but its various parts have to be estimated in the light of common sense and political judgment. If Mr. Taft had appreciated the evident fact that the whole country understood the tariff plank as binding him to do more than it said in so many words, and other planks as not binding him at all, he and his party and the country would to-day be in a better position.

In his speech at Port Jervis, N. Y., on October 23, 1906, during his first campaign for the Governorship, Mr. Hughes thus set forth his beliefs on the Anti-Trust Law of 1890:

> We do not want anything which will interfere with business enterprise. We don't want anything which will interfere with investments to give opportunities for labor. We do not want to return to soup houses. We don't want to make it difficult for men to find employment. But, on the other hand, we do want to make it difficult for anybody or for any set to unite together and prevent other people from having perfectly fair and just treatment. We want to end discrimination in business. I am for the Anti-Trust act.

Even without this explicit affirmation, the Governor's activities in preparing the new insurance law and in establishing the Public Service Commissions would have provided convincing evidence of his position. But the speech of 1906 also reflects the Governor's belief in conservative interpretation of the law. It was the man he succeeds, Justice Brewer, who, in the Northern Securities case, although he concurred with the four other Justices who found against the company, held that the verdict should be based distinctly on the ground of "unreasonable restraints of trade," and not extended to "those minor contracts in partial restraint of trade which a long course of decisions at common law had affirmed were reasonable and ought to be upheld." Neither in Justice Brewer's attitude, nor in that of Gov. Hughes is there to be found any support for Judge Lacombe's Circuit Court opinion on the Tobacco case in 1908, that the Anti-Trust Act "prohibits every contract or combination in restraint of competition," and that two rival express-wagons, which should join forces in operating between villages on opposite sides of a State line, would be repugnant to the law.

> My position as regards the moneyed interests can be put in a few words. In every civilized society property rights must be carefully safeguarded; ordinarily and in the great majority of cases, human rights and property rights are fundamentally and in the long run identical; but when it clearly appears that there is a real conflict between them, human rights must have the upper hand, for property belongs to man and not man to property.—[Mr. Roosevelt at the Sorbonne.

This is sound doctrine, every word of it. It is the same doctrine that Mr. William Jennings Bryan made familiar in his first great campaign. He packed it into epigrammatic form in the phrase, "The man above the dollar." To him, however, it "clearly appeared" that there was a "real conflict" between human rights and property rights in the question of the gold standard, and his conclusion accordingly was that the gold standard must go. Mr. Roosevelt, on the other hand, was at that time denouncing Bryan as a repudiationist of the worst kind, because it was *not* clear to him that the line between human rights and property rights was to be drawn in the way that recommended itself to Bryan and his followers. Mr. Debs, again, is firmly convinced that human rights conflict with property rights in a far more profound manner; while Count Tolstoy goes further still. In fact, the doctrine so solemnly set forth by Mr. Roosevelt leaves us exactly where it finds us; and every man Jack of us, from Senator Aldrich to Herr Bebel, can subscribe to it without fear that it will incommode him.

The promptness with which the trial of a peculiarly atrocious and revolting

murderer was brought to a close in this city last week, the firmness and dignity with which the proceedings were conducted by the judge, and the efficiency of the District Attorney's office in the handling of the case, have been made the subject of deserved commendation in the press. What has been praised as an exception ought to become the rule, and indeed a mere matter of course. Our country distances all other modern countries, by far, both in the number of homicides and in the small proportion of convictions. Although it is not the only cause, yet it is certain that one of the great causes of the multitude of murders in our country is the lack of business-like determination in the prosecution of murderers. Even the comfort that can be got out of this case, in which the matter was concluded with proper expedition, is diminished by the consideration that the crime was so unspeakably abhorrent, and the criminal so devoid of any redeeming quality, that there was no room for sympathy on the part of the most morbid or the most silly; and in addition to this, the evidence was simple and overwhelming. Nevertheless, it is to be hoped that this example of expeditious procedure, sacrificing no right of the accused, but at the same time not trifling with the stern demands of justice, will help to set a standard for future trials.

For reasons not obvious, American operas based on plots concerned with red men have never been successful. A conspicuous instance of undeserved failure was "The Ogallalas," by Henry Waller, who is also remembered to-day because he was the first American who succeeded in getting one of his works performed at the Royal Opera in Berlin. It does not seem likely, however, that the demonstration made against "Pola" in that city on Saturday night and in the following day's newspaper criticisms had anything to do with its Indian subject. The Germans have ever been fond of Indian stories; their boys and girls read Cooper as much as ours used to read him, and he has been imitated by Gustav Nieritz and other popular writers. Moreover, exotic music is much in favor at present, and as Arthur Nevin's opera contains tunes gathered in the camps of Blackfoot Indians, it should have made additional appeal from this point of view. Had it been simply an uninteresting opera, it would have been damned with faint praise and allowed to vanish silently. The heat of the opposition was evidently due to long repressed indignation at the Kaiser's predilection for things American, including opera singers. Was it not enough to have half a dozen of the best places at the Royal Opera given to Americans, without lugging in American operas, too, when Germany has so many composers awaiting a hearing?

Renewal of trans-Atlantic wireless telegraphy by the rebuilding of the burned station at Glace Bay was assuredly a fitting occasion for the exchange of congratulatory messages between the postmasters-general of Canada and Great Britain, and Mr. Marconi. "We are the real rectors of the world," said one of the most distinguished living Canadians not long ago to the rector in whose parish lies one of his country estates; "we men who are bringing the peoples of the world closer together by means of great railroads and steamships, who devote our lives to the annihilation of time and distance." Powerful agents of progress such men undoubtedly are, and if within their overwhelmingly practical personalities there is left a spark of idealism, as in the instance referred to, the world may consider itself doubly blessed. The possibilities of the wireless are yet as vague as they are tremendous. Who may foretell the effect on the history of the future of world-wide conversation through the air? Already, in its infancy, its C. Q. D. has thrilled the human mind with its message of elements conquered and man triumphant.

The wreck of the Zeppelin II will elicit world-wide sympathy for the aged inventor, who seems fated to see a long life of endeavor filled with disappointments. It is not to be supposed that the German people will again come to his aid as they did last summer, when they subscribed nearly three-quarters of a million dollars to replace the airship that was destroyed at Echterdingen. That popular upheaval was more in the nature of a national vote of gratitude to Count Zeppelin than of confidence in his solution of the problem of the air. Expert opinion has all along been against the Zeppelin type of a rigid and enormous airship that is costly to build, costly to drive and stable, and, by very reason of its enormous bulk, at all times exposed to the mercy of the storms, as has now been tragically demonstrated. Even if Zeppelins could be kept from dashing themselves into fragments, they would call for an elaborate equipment that would greatly reduce their value under actual conditions of warfare. A whole regiment of men to hold the ship down is something that a commanding officer in the field might find hard to spare. If the dirigible is to play a part in modern armaments, the choice plainly points to the smaller semi-rigid or flexible type as developed in the German Gross and Parseval machines and in the various French airships.

But even the cheapest of dirigible machines is an expensive affair compared with the cost of a Wright or Farman aeroplane; and the question of cost will enter largely into the ultimate decision between the merits of the heavier-than-air machine and the steerable balloon for purposes of war. The last two weeks have shown that in fair weather the dirigible can fly far and the aeroplane can fly far, as it has done for Paulan and the Englishman White. And it has also been shown that in rough weather aeroplanes and dirigibles will alike go to smash. It becomes, then, a practical question for the people in charge of Europe's military budgets whether it pays to invest the same amount of money in a single dirigible or in a dozen aeroplanes. The greater degree of stability is, of course, still with the former; but as a matter of practical economy, it might pay to let a half-dozen aeroplanes turn turtle for every one that responds to the task put upon it. It is not necessary in the ultimate settlement of the question that the decision shall be all for the aeroplane or all for the dirigible. There may easily be room for both. The balloon, with its expensive sheds and equipment, would correspond to the present fortress or system of coast-defence. The aeroplane, comparatively compact, portable, independent of gas and hydrogen supply, would be the counterpart of the field artillery, or even the light machine gun.

Despite the optimistic reports from Havana indicating that the Republic is proceeding vigorously against the disaffected negroes headed by Gen. Estenoz,

there is no disputing the critical situation of the Government. Whether the present action will really inspire fear of the Administration sufficient to tide it over the summer remains to be seen. The West, it is rumored, has been "organized" against Gomez, as the phrase runs, for some time past. There is acute jealousy between the new regular army, unnecessarily created by the last American government of intervention, at whose doors many sins must be laid, and the Rural Guards. Gen. Pino Guerra, the commander of the uncalled-for regular army, was careful to recruit most of its members from his own province, Pinar del Rio. Having been himself merely a frequenter of cafés, without regular employment, prior to the revolution of 1906, his major-general's commission was so rich a reward for heading the rebellion against the Palma Government that it is not to be supposed he would look with disfavor upon another uprising, particularly as he is reported to have quarrelled with Gomez. The distribution of spoils has been going on now for something over a year—long enough to create many malcontents who feel that they are not getting their share of the booty. Fortunately, the sugar crop has been a good one; else the outlook would be menacing, indeed.

That the head of Scotland Yard should have used official secrets to supply to a newspaper articles which, it was obvious, would be used as campaign material is certainly a sufficient cause for British indignation, even after the lapse of many years. It is no wonder that a division in the House of Commons has been necessary to negative a motion to cancel the appropriation for Sir Robert Anderson's annual pension, after his bland avowal in a magazine that he was the author of the sensational "Parnellism and Crime." Hardly less humiliating to Englishmen than this revelation is the memory that the judgment of all concerned in the London *Times's* notorious publications was as ridiculous as the evidence with which a sorry attempt was made to combat the charge of libel. Piggott confessed forgery and blew his brains out; Le Caron, the spy, was obliterated, and the newspaper itself was almost wrecked. Had the evidence been sound, it would have been a matter for the prosecuting authorities, and if a detective's unsupported story was insufficiently corroborated for such a course, it was equally at fault for the purposes of newspaper publicity and party capital. But statements now freely made that the spy was an *agent provocateur*, and that the whole affair was a "put-up job" in which all the principals concerned were conspirators, will not be generally believed. Exasperation followed constant Fenian outrages. The Government was justified in using a secret service. To charge that this secret service itself instigated outrages is to charge conduct entirely out of harmony with British character.

The French electoral campaign has been enlivened by the appearance of a score of women as candidates for the Chamber of Deputies. How recent is the suffragist movement in France may be gathered from the fact that while the suffragette has almost disappeared from the columns of the British comic weeklies, she has now for the first time been exploited by the Paris press. Albert Guillaume in *Figaro* suggests that the woman whose husband is inclined to grumble at dressmakers' and milliners' bills is now in a position to threaten him with the much more expensive dissipation of running for Parliament. And yet one would imagine that the question of woman-suffrage would present itself most seriously in France, which is in the habit of thinking of itself as holding the vanguard of civilization, as the first nursery of political and social revolutions. The case is all the more odd because the French woman is so frequently on an equal economic basis with her husband, whether he be wage-earner or small business-man. And in higher circles of society, French women do exercise that indirect influence on politics, art, and literature which is in other countries more spoken of than real. Possibly in this very fact consists the reason of the French woman's smaller measure of discontent.

Something more than considerations of administrative military policy is probably involved in the reported decision of the Russian war office to transfer an entire army corps from the western frontier to the Volga region and southern Russia. The move is described as tantamount to an abandonment of Poland in case of an invasion by Germany. But the decisive step in that direction was taken some time ago when the Russian Government determined to abandon its chain of Polish fortresses and to concentrate its defences on the Asiatic frontier. Is it against Persia that the Russian forces are massing? Is it to Turkey in Asia, or possibly to Japan, that the index points? Or are the Polish battalions needed for keeping domestic order in the Volga provinces where, three years ago, there was danger of peasant uprisings? Whatever may be the motive, it is a situation which will be received with bitter dissatisfaction in France. This Russian alliance which has cost the French so many hundreds of millions and which utterly failed them in the hour of need, five years ago, will become a weaker reed than ever if Germany is entirely relieved of the menace of Russian troops on her eastern frontier.

Big with the promise of the future is the so-called United Universities Scheme, originating with Oxford and Cambridge, and intended to promote the foundation of a university in China which shall unite the educational forces at work there under a central head, at the same time preserving their autonomy, and shall also found new branches of educational work from the same source. On this matter, the distinguished Rector of Hatfield, the Rev. Lord William Gascoyne Cecil, brother of the Marquis of Salisbury, is now in this country with a mission to the presidents of our leading universities to arouse their interest in the plan. It is contended that far-reaching results will be attained by forming the forces of education into colleges and hostels on the plan of the English universities, and it is hoped by the committee in charge of the scheme, a committee on which are many men prominent in scholarly and clerical life in England, that not only will China be benefited by the adoption of such a plan, but that also by it the bond between England and the United States will be strengthened. In the words of Lord William Cecil, "China *will* have Western civilization," and the idea of combining the forces of this country and of England to present that civilization in a desirable and dignified form, must appeal strongly to those who are carrying on the work of our universities.

GOV. HUGHES'S APPOINTMENT.

Gov. Hughes's decision to accept the appointment to the Supreme Court offered to him by President Taft takes from our active political life its finest figure. We had, frankly, not thought it possible that Mr. Hughes would even consider the offer. That so splendid a moral force, so rare an Executive, and so unselfish a patriot should be removed from the sphere of statesmanship, even by appointment to so exalted a position as the bench of our highest tribunal, appears to us a severe blow to the whole movement for the reform of our political conditions. The judge is necessarily excluded from the arena. His voice may be heard occasionally, as was Justice Brewer's, in the forum or the pulpit or on the platform. But when Gov. Hughes takes his seat in Washington a great educative force will be lost. That tremendous driving power which, coupled with his downright earnestness and sincerity, has twice convinced the State where its best interests lay, and with it his unusual executive ability, will fall into disuse. The strongest force for reform—strongest because of wise radicalism allied with a judicial temperament—is now to go out of our workaday political life.

From this point of view we cannot conceal our regret at Mr. Hughes's decision. Mr. Taft has rightly called him the Republican party's greatest asset. Even had Mr. Hughes gone back to the practice of the law, he must have remained a source of inspiration and power, ready to lend his ability and prestige to the great work of driving from our public life the bosses who have opposed his reforms, and of putting back into the hands of the people the control of their own affairs. It was impossible to think of Mr. Hughes really divorced from our political struggles; it was very easy to think of him as Senator in Washington, and even occupying a higher place, and still easier to think of him as in his law office a great moral leader of his party in the nation, in reserve for just such an emergency as made him Governor in 1906.

Yet from the point of view of the Supreme Court, everybody must rejoice; and we should be the last to underestimate the value of the services Mr. Hughes can render as a member of that body. Questions of far-reaching moment that call for another Marshall are coming before the Court, and will continue to come before it, testing our written Constitution as it has never yet been tested. That the Court needs vigorous, active personalities, men of sound judicial training combined with a clear understanding of the underlying political forces of the day, is undeniable. It has needed strengthening, needed it so badly that Mr. Taft's exultation on receiving Gov. Hughes's acceptance is easy to understand. So keen and trenchant a mind is bound to make itself felt at once; and it is natural to look forward to its exercise, later on, in the Chief Justiceship. Moreover, the Governor's comparative youth insures that continuity of service for years to come, the lack of the possibility of which caused the opposition to Justice Lurton.

If it is seldom of late years that a man has stepped from high executive office to the Supreme Court, no one will dream of criticising Mr. Hughes's appointment for that reason. Between Salmon P. Chase's service as Governor of Ohio from 1855 to 1859 and his becoming Chief Justice were his three years and more in Lincoln's Cabinet. Like Gov. Hughes and Edwin M. Stanton, Chase had never held any judicial office before going to the highest. But in his executive position at Albany, Mr. Hughes has displayed such unquestionable judicial qualities, besides exhibiting extraordinary zest for severe mental application, that Mr. Taft did the merely obvious thing in offering him Justice Brewer's place. That Mr. Hughes received it as a call to service is beyond question. We would not lay stress today upon the pecuniary sacrifice which Mr. Hughes makes in accepting the Justiceship. The alternative of a lucrative law practice in New York, with an income of a hundred thousand a year or more, might have made some men waver in their minds, but not, we are sure, Gov. Hughes. It is the opportunity to continue in the public service which has appealed to Gov. Hughes.

In what shape Gov. Hughes's transfer to the bench leaves his party in this State, on the eve of an important campaign; the effect of turning over the Governorship to the discredited Lieut.-Gov. White, and the fact that this change in Mr. Hughes's fortunes makes Mr. Roosevelt and Mr. Taft undisputed masters of the Republican party in the nation—these are questions into which we do not propose to enter to-day. We would rather, for all the regrets we have expressed, congratulate the country that Mr. Hughes is to remain in the public service, even if not in that capacity in which we feel that the country's need of him is most intense. He has done the State inestimable service—service the value of which will be better understood as time passes. For time can only add to the appreciation of his courage and his unsparing devotion of every thought and action to the people's interests. As soon as we get a perspective, we shall perceive clearly that Mr. Hughes has not only set up new standards of executive devotion and skill, but has made the whole country realize afresh the possibilities offered by the headship of our State governments for distinguished and useful service to State and country. In that way at least his influence will remain active in political life.

THE PHILIPPINE LAND SCHEME.

Whether it is the Sugar Trust or some other purchaser that has obtained a large slice of the Philippine Friar lands seems to us for the moment relatively unimportant. Congressman John A. Martin of Colorado is certain that the Sugar Trust has bought it through a dummy named Poole. That would not be surprising. When Mr. Forbes, the new Governor-General, was last in New York city he made an urgent appeal for the investment of capital in the Philippines. He wanted American business men to build railways, erect mills, purchase plantations, and generally to exploit the archipelago, or, as the cant phrase runs, "bring the blessings of civilization and prosperity to the islands." Only the lack of capital, he declared, prevented an extraordinary advance in the Philippines. It was consciously or unconsciously a deliberate invitation to the powerful syndicates that are seeking outlets for American capital abroad to come to the Philippines, whose richness Mr. Forbes vaunted.

Naturally, those who believe in the Philippines for the Filipinos protested. All, on the other hand, who desire to see the United States permanently hold the archipelago for purely money-making purposes applauded. They feel sure that if millions of American dollars are invested in the Philippines by the all-powerful business interests, the flag will

never come down; that all those solemn pledges of benevolent intentions on our part, given by McKinley and others, will be forgotten, save by a handful of New England cranks, with their mouthings about national honor and duty. Unfortunately for Mr. Forbes's ambitions—we would not, of course, for an instant suggest that his motive is other than a sincere, though in our eyes mistaken, desire to aid the Filipinos—the organic law of the Philippines, a noble and enduring monument to the late Senator Hoar, is a fatal obstacle to the plans of capitalistic exploiters, in that it forbids the selling of more than forty acres of land to an individual and of more than 2,500 acres of land to a corporation. And this was made the organic law for the *express purpose* of preventing that very capitalistic exploitation of the islands now desired. It has prevented such exploitation, because 2,500 acres is too small a holding of land to make possible sugar planting on a sufficiently large scale to attract a syndicate or Trust.

As the National Progresista Party of the Philippines recently declared in convention assembled, the majority of the Americans in the islands, besides wishing these land restrictions removed, maintain that a declaration of perpetual American sovereignty is also essential as an inducement to that foreign capital which the Filipinos themselves have no desire to see entering the islands. Why should they? To exchange their present situation with all its limitations for a tense industrial system with overbearing foreigners—and Americans are the most hated foreigners in the Philippines—driving them to their tasks, is a thing that in no wise appeals to them. They, in their blindness, do not long for greater comforts of life and for higher standards of living at the cost of lives spent at arduous factory or plantation labor. They make a livelihood, bare at times, and why must they do otherwise at the behest of outsiders? To this has come a sharp reply from the United States Government headed by William H. Taft, the man whom, of all the Americans sent to them, the Filipinos loved best, because of his freedom from race-prejudice and his insistence upon the doctrine of "the Philippines for the Filipinos."

This reply is the sale in one lump of 55,000 acres of Friar lands to one purchaser. Unable to upset the organic law, the Administration has seized upon the opportunity afforded by the acquirement of Friar lands to declare, through an opinion of Attorney-General Wickersham, that the Friar lands are outside of the organic law. Indeed, the Insular Bureau asserts that "it has never been the understanding of the Philippine Government that the Friar lands were public lands in the sense in which the sale and lease of public lands was legislated," and avers that it would have had to dispossess tenants of long standing, if it did not permit them to purchase the lands they have rented. Mr. Wickersham as a lawyer of eminence would, of course, be indignant at any suggestion that he would write opinions to please the Government. It is surprising how many times the law happens to fit an Administration's desires! In this case, his opinion has been strongly assailed by able lawyers like Moorfield Storey of Boston. And it is a striking fact that the Senate Committee on Philippine Affairs has approved a repeal of the organic law. "Come in," the Administration can say to the Trusts, if this bill passes, "and help yourselves to the Philippines. We pound you at home, but will make it up to you in the Philippines"; and, of course, approval of the act will salve the consciences of those who, to our mind, have been acting under an interpretation of the law which, good or bad, is heartless, a betrayal of confidence, and essentially a violation of national faith.

There lies the meat of the matter. Whether the Sugar Trust is or is not the purchaser, whether the Henry W. Taft law firm is or is not involved, the sale of the 55,000 acres is indefensible morally, a shocking violation of trust, incredible from Mr. Taft's Administration, in view of his attitude when Governor-General. Of the repeal of the organic law, which Mr. Lodge is now moving for, we can only say that if it comes to pass, it will reveal anew how firmly the Republican party is in the grasp of the corporate interests. As for the Filipinos, the repeal of the organic law and the sale of the Friar lands would be enough to implant the seeds of revolution in the hearts of all who learn of it. It would mean a new motto: "The Philippines for the land-grabber, the exploiter, the Trust, the conscienceless corporation."

CULTURE AND DEMOCRACY.

The letter from President Woodrow Wilson which appears elsewhere in this issue it gives us particular pleasure to print. We hasten to add, however, that we were not in need of the assurance with which it closes. "I beg you will not believe," says Mr. Wilson, "that because I seem incapable of stating more than one side of a question in any one speech, I do not know and appreciate the other side." It is not the state of President Wilson's own mind that has caused us to criticise one or two of his utterances. On the contrary, it is because he is the very kind of man who inherently stands for the value and dignity of learning and culture that we regretted to see him, whether consciously or not, adding force to a current that sets strongly against them. There has been in recent years a remarkable spread of the idea that the only result worth caring for in the work of our colleges is what can be measured by definite external achievement; an idea which, though it may be but the exaggeration of a sound and laudable sentiment, is nevertheless doing serious mischief. Were it to become dominant it would sap the vitality of our colleges in the performance of what has been, and ought to continue to be, one of their chief functions. There is room in the world, and there is need in the world, for men of quiet tastes and of keen intellectual interests; men who modestly and faithfully fulfil their duties as citizens, neighbors, friends, but who are not by nature gifted with either the powers or the inclinations necessary for leaders in the world of business enterprise or of political struggle. Nor can we easily imagine a more serious loss to the life of a nation than would come from depriving such men of a recognized and respectable place in it.

The view against which we are protesting has been prompted, above all, by the great preacher of strenuosity. Mr. Roosevelt has omitted no opportunity to impress upon the young men of the country the doctrine that any life not chiefly concerned with "doing things" is a life to be looked upon with contempt. Properly understood, we should probably all agree with the ex-President. But there is no mistaking the sense in which he has meant to be understood and in which he has been

understood. The "mollycoddles," whom he never tires of belaboring, are not creatures of the imagination. When he holds them up to public scorn, he means something definite. It is not a harmless recluse here and there that he has in mind; these extremely rare birds of our American human fauna would certainly not be worth the great hunter's powder and shot. He means, and he has been understood to mean, a somewhat considerable class in our American citizenship; a class which, we are free to admit, could be dispensed with at less sacrifice of the primary requisites of the national life than could the more strenuous type of which Mr. Roosevelt himself is the extreme specimen. But we contend that our country is not so poor, not so hard-driven by fate, that it must confine its desires or its expectations to the fulfilment of the primary requirements of national life. Nor have we ever been able to see that the multiplication of men devoted to intellectual interests has been going on at so dangerous a rate as to constitute an imminent peril to the nation.

Of a type as nearly opposite to that of Col. Roosevelt as can well be imagined, President Eliot has nevertheless given a curious illustration of the influence of the prevailing current. At least, no other explanation seems so plausible of his extraordinary doctrine of the five-foot shelf. It is scarcely possible that Dr. Eliot should have seriously believed that everybody could become a liberally educated man by a half hour's reading every day of a list of books prescribed once for all. But he could not even have fallen into the momentary error of making such an assertion had there not taken place in his mind some sort of undermining of the position of a liberal education. That nothing is of very much consequence which is not accessible to everybody; that the peculiar, the remote, the thing that calls for special exertions and special tastes and special spiritual endowment, is a thing scarcely worth considering among the important acquisitions of life—this is the sort of view which, alien as it must seem to the whole of Dr. Eliot's life and character, must yet have been at the bottom of the five-foot shelf escapade. And it is of a piece with the Rooseveltian levelling strenuosity; of a piece with the new cult which would make democracy and self-contained individuality mutually exclusive terms.

The great danger that threatens this Republic, we are all agreed, comes from the concentration of interest upon the accumulation of wealth, from the love of luxury, ostentation, and plutocratic power. That has been the prolific source of corruption in politics and business; that has been the prolific breeder of discontent, of class antagonism, of socialistic and anarchistic agitation. The dangers thus arising must be fought by a sturdy citizenship arrayed against it under the inspiration of strong and aggressive leaders. But it is idle to attempt to recruit every man into active service in this war; it is still more idle to exhort every man to fit himself for the post of a captain or a general in it. We hold no man exempt from the faithful performance of the ordinary duty which, by common consent, falls upon all the citizens of a republic: the duty of forming a conscientious and intelligent judgment, and fearlessly acting in accordance with that judgment. Those who do more shall be duly appreciated; those who do most shall be held in the highest honor. For the great majority, however, there is no question of a life of notable and strenuous service for the community. The question for them is, what they are going to make out of life in the pursuit of one or another of the ordinary vocations of mankind. And of all the ways of meeting this question, there is none that can be more useful, in this very struggle against the dangers of materialism and plutocracy in which Mr. Wilson is so brave a leader, than that which contributes to holding up before the eyes of all men some other goal than the possession of power or the boast of pecuniary success.

TWO FRONTIERSMEN.

It is an odd reflection that the future literary historian who seeks the greatest American writer of the end of the nineteenth century will pretty surely have to choose between Mark Twain and Henry James. None of their contemporaries, we feel, has so fully realized his native gift. Mark Twain and Henry James have apparently gone as far as it is possible to go in diametrically opposite directions. Yet there is a point at which their talents meet. Both are essentially frontiersmen. Mark Twain is the chronicler *par excellence* of the palpable frontier of robust America; Henry James is the scrupulous analyst of that spiritual frontier which unrobust and nostalgic America established in the old country. Each has brought to his chosen material a singular expertness and fidelity. If Mark Twain has stretched his muscles and spent his sympathy from the Mississippi to the Sierras, Henry James has no less lived strenuously through the more sombre spiritual adventure of the American in Europe.

Sooner or later, sociologists will take account of a significant reciprocal movement. Just as America has attracted the alert, muscular, and hopeful hordes of Europe who seek material prosperity, so Europe has obsessed the gentler, more discursive, and brooding imaginations of a certain type of Americans. It is easy to dismiss them, once for all, as bad Americans. A careful reading of Henry James's novels would prompt a more pitying judgment. Through their lack of simplicity and of constructive energy these people are aliens in their own land. They long for certain fruits of leisure and joys of reflection that it supplies in rather short measure. They are oppressed by the sense of a relentless activity the value of which they are forced to question. Whether they go to Europe or stay, they are in a manner outlanders, and where they settle in numbers there is a spiritual frontier.

It is needless to say that Henry James is their prophet. That he is their advocate, it would be hazardous to assert. With them he shares the habit of suspending judgment in favor of simple observation. Their minds and his are possibly never made up. A kindred destiny forces them to seek a lodging-place amid the graceful forms and complicated allurements of relatively finished civilizations.

Now, the characteristic of Mark Twain's people is that their minds are made up on all main issues. They laugh at themselves and their neighbors, but they never ask the paralyzing question *cui bono?* For them anything and everything is worth while. Their extreme exemplar is the Yankee at King Arthur's Court. It never occurs to them to see the other side. Why is "Innocents Abroad" an infinitely diverting book? Partly, we think, because the Innocents are so supremely unconscious of the fact

that the gods are laughing not with them, but at them. No other writer has created so many forth-right efficient persons; no one so fully grasped the stalwart *insouciance* which is the very genius of outward America.

How exterior Mark Twain was, it is difficult to imagine. It was at once his superiority and his limitation. One may say that the philosopher in the man almost never slopped over into his books. His concern was with action, and it is significant that when he essayed what he probably regarded as higher flights, not the novel but sheer romance was the result—"Joan of Arc." He is akin to the great impersonal geniuses who have made the picaresque tale classic—the Le Sages, the Defoes, the Smolletts. His manner grew inevitably out of his matter. It was plain, forceful, with the effective inelegant flexibility of life itself. In a high degree, he was creative. He set forth in flesh and blood pretty much all that Whitman intimated in nebulous and rhythmical metaphysic. A great figure who knew his bent and followed it to culmination with instinctive and unperturbed consistency.

An equal fidelity to his vision distinguishes Henry James. Being complicated, he has disdained to make it simpler than it is. Every phase of the soul yearning for orderliness amid the tumult of mere deeds—all the pathos of the temperament vainly seeking congenial forms—he has fathomed and exemplified. Is Europe a home, a casual inspiration, a mere narcotic? Such problems he never settles. Enough that it draws those pioneers who at home find no space for dreams. As Mark Twain was predestined to be a clear writer, Henry James was fated to be a difficult and obscure one. Mark Twain's material has bounds—is as apparent as a pack train on a sky line. Henry James's material leads him to deeper mental involutions, border-line stuff, where the landmarks are matter of conjecture.

Of these two great writers whose stars have led them to antipodal frontiers, which will the future choose? We are not in a position to answer. Possibly the future will perceive the value of Mark Twain's four-square pioneers, whereas, when America has absorbed her nostalgics, Henry James's people may look like odd and incredible figments. We rather think that some place may be found for them beside other exemplars of disillusion—Pater's Marius and Byron's melancholy Childe. And obviously the ultimate preference will depend largely upon whether the choice is by life or by art. On either score, Mark Twain's chances seem pretty good, while the fate of Mr. James's delicate art seems to be involved in the hesitancy that afflicts his own heroes.

UNNECESSARY QUESTIONS.

In the way of serious comment, it may be proper to point out that the results of the Census, though as yet unknown, are bound to show that for increase of population, wealth, and happiness, we are still far ahead of all other nations. But most of the comment at the present stage of the nose-counting is of a distinctly humorous quality. It consists in pointing out the Spartan inflexibility with which the Director of the Census insists on getting the obvious answer to a perfectly useless question. Why is it essential to the success of our decennial enumerations that the head of every family shall be called upon to state that his sons are males and his daughters females; that not only is he of white descent and his wife of white descent, but that their children are also of white descent; that his youngest son, aged two, has never been in the military or naval service of the United States, and that his venerable grandfather, aged eighty-six, has not attended school since September 30 last? Is not all this a waste of good paper and ink and time?

The waste may be there, but it is the kind of waste that enters into the most intimate phases of life. The questions that really shape human happiness in the daily life are perfectly obvious questions. The replies that count are the replies which the questioner knew he would get and was even prepared to insist upon getting. What reply does the minister await when he asks the man and woman who have appeared before him whether they are willing to be joined in lawful wedlock? What reply does the minister await when he asks the parents of the newborn infant whether they are willing to have the child baptized into the community of the redeemed? What is all ritual as it has been drawn to meet all the needs of the heart, but a preordained order of questions and answers? In birth and in burial, in joy and in sorrow, for those who have escaped shipwreck and those who have escaped the plague, the practice of the ages has laid down formulas which the pious soul does not find the less acceptable because they are ready made. Question and response as ordered in the book of prayer are solemn largely to the extent to which they are ordained by long practice. The clergyman who puts the question the communicant waits for, the communicant who pronounces the reply it is incumbent on him to utter, are partners in the solemn ratification of a treaty wherein the old formalities are based on a present and active consent.

The mumbled question that is seldom heard and the traditional reply that is seldom listened to, make up the ordinary meeting of minds in the great routine of life. The clerk in court stares at the wall and repeats his formula beginning "Dyousolemnlyswear" and ending "swelpyougod," and the witness on the stand answers impatiently "I do." The Chief Justice of the United States asks the President-elect if he will be faithful to the Constitution and the duties of his office, and the President-elect invariably says that he will. The candidate for American citizenship is asked whether he hereby renounces all allegiance to foreign kings, emperors, and potentates, and responds fervently that he does. The member-elect is called upon to state whether he promises to live up to the laws and by-laws of the organization and never fails to give his promise to do so. The insurance examiner asks you whether you have ever been afflicted with asthma, bronchitis, calculus, dementia, erysipelas, and a hundred other visitations, to all of which he himself solemnly replies "No."

We are in the habit of speaking of the increase of human knowledge and of the thirst for information which persists in asking questions about the North Pole and the currents of the air and the unfathomed depths of the sea. But for every question calling for an unascertained answer, there are a million asked every day in which the reply is preordained. In so many laboratories there are biologists putting questions to their microscope; in so many offices are clients putting questions to their counsel; in so many other offices are anxious men and women putting

questions to their physicians. But great as their total must be, it is quite insignificant in proportion to the number of questions that are put during the course of a single day, in all the schoolrooms of the world. A greater amount of human intercourse has centred about the multiplication table than about all the spectacular achievements of science since the beginning of time.

If anything were needed to emphasize the importance to man of a well-adjusted scheme of query and response, it is only necessary to recall how suspicious and uneasy and discontented most of us are in the presence of an unfamiliar reply to a familiar question. If we were to ask a stranger whom he regarded as the greatest dramatist of all time, and he were to say Shaw instead of Shakespeare, the effect would be the same in kind, if not in degree, as if one were to ask the same man whether he liked coffee or tea for breakfast, and he said he preferred arsenic. It would be almost as if, when one said to one's hostess, "Well, I suppose I have stayed quite long enough," she were to yawn and say, "Yes, I think you had better be going."

THE IMPROVEMENT OF THE TEXT-BOOK.

The history of what has become known as the text-book forms an important part of the annals of American education in the last half-century. The name indicates the idea that a book represents the essential teachings concerning a subject, as the text of a sermon represents, or is supposed to represent, the chief doctrines of the discourse itself.

The text-book is a teacher of teachers. If it is not a force which the teacher may substitute for himself, or as the text of an author stands for the great truths which the commentator interprets, it is at least a condition through which the teacher presents a subject to the class. The wise teacher and large uses many text-books for his own training, and for suggesting to himself the most effective methods of teaching. The text-book also remains for the student a permanent treasure-house, where he may refresh his own declining memory, and whence he may draw specific facts for his own use.

The more obvious change in the character of text-books in recent years relates to the part of the publisher. The book has become a far better book, both to the eye and to the hand. The paper is firmer, the ink blacker, the type easier for the eye, and the different forms of type serve to represent more clearly and impressively the primary and subordinate truths presented. The composition is also fairer, the binding more lasting and more artistic. The illustrations and plates of many sorts are chosen with greater care and with a better adjustment to the text, and are executed with finer taste.

The fundamental change, however, wrought in the text-book during this period, is that it is written for the purpose of teaching the pupil and not for the purpose of presenting a subject. The point of view has absolutely changed. The author of the text-book of the former time desired to give a scientific statement regarding his subject; the author of the present time desires to teach students. It is important, imperatively important, to make at times a scientific statement of a subject, but that work is distinct from the purpose of teaching boys and girls. A better psychology has come to prevail. The text-book represents a desire to adjust truths and the presentation of truths to the mind of the pupil. A careful study has been made by the makers of books of the content of children's minds. They have sought to adjust the progress of their instruction to the enlarging growth and increasing power of those who will use the book. The best text-book of the generation represents the union of two elements—a proper knowledge of the subject and a proper knowledge of the mind of the child.

Allied to this psychological condition is also the fact that the text-book has come to relate itself to the present or the future needs of the student. The authors of these more modern volumes have pictured to themselves the lives which these boys and girls are to live, and the work which they are to do. They have sought to make their books of practical value, adopting a clear interpretation of the ability of pupils. They have also found it not difficult to try to be of special service in their future careers. They have recognized that these boys are to become clerks and merchants, and these girls heads of homes and heads of school-rooms, as well as to be daughters at home. Under this conception of the student's future, changes revolutionary have been made in the text-books on almost every subject.

In that old and absorbing subject of arithmetic, the change has been fundamental and is characteristic. It has resulted in simplifying the whole treatment of numbers. It has cast out "true discount," which was never "true," and has given real discount which is constantly used. It has eliminated that trying topic of "equation of payments," a topic quite useless in our present currency, and also "permutations" and "combinations." It has resulted in introducing into the problems of arithmetic facts which are immediate and vital. In one practical text-book, under problems of magnitude are introduced questions on the building and furnishing of a house. Bills for lumber, for plastering, for carpets, for papering, for laying out a garden and grounds, are topics considered.

In geography the change is hardly less fundamental. School geography has ceased to be concerned only with mere facts and with exterior descriptions, and has become an interpretation of the world and of its peoples. It has come to represent the reasoning processes about the globe and its inhabitants; it has become physical, and the physical has become psychological, and it has also become social.

History, too, has taken on the elements of a story of the life, the customs, and the thoughts of nations and peoples. Wars no longer consume a large part of the interest. Kings and queens do not command so great a share of the student's attention. The way in which people live, day by day, the books they read, the way they earn and spend their money, and the amount of money they earn or spend, the food they eat, the houses in which they live, the topics about which they talk, the schools to which they go, have become quite as important in the thought of makers of text-books as the story of Victoria's reign or the downfall of either of the Napoleons.

In a word, the text-book is humanized. It has come to be written with a desire to adjust itself to the mental state and growth of students. It has also sought to follow the needs of the future life of these same students.

These books, moreover, represent a manner of writing far superior to that obtaining in the earlier examples. The primary qualities of good style are more common. Other elements which, though not so essential as clearness and force, are frequently, even if not constantly, found. There are rhetorics which are themselves examples of good rhetoric, and grammars which in their writing inspire pupils to write correctly, and historical text-books written by masters of historical composition.

In one department has occurred not so much a revolution as an expansion. In English literature the student has been brought into a reading of the great authors themselves. The reading book of the earlier time taught the student to read, but it offered him little worth reading. The new book not only aids in getting the art of reading, but it also offers the best which our literature contains. The result represents the enrichment of the mind and the strengthening of the character by the noblest wealth of the race.

I wish, further, to add that in the improvement of the text-book for the American school and college in the last

half-century, the publisher has borne a necessary and efficient part. Pecuniary motives have influenced, but they have not proved to be the only incentives to this high service. He has also desired to make books which should result in the enhancement of the welfare of the community. He has come to recognize that the community is more urgently demanding the most effective books for giving training and culture. To this end he has used every force for securing the best writers.

The result is that, through this interest and other causes, the school-books of to-day are far superior to those of the middle decades of the last century. They are, on the whole, better than those of any people, though in respect to a certain deftness and beautiful clearness of writing the French are superior.

CHARLES F. THWING.

Western Reserve University.

BJÖRNSTJERNE BJÖRNSON.

By the death of Björnstjerne Björnson, Norway has lost her chief interpreter. The world at large will not mourn for him as it did for Ibsen or for Grieg; but loyal Norwegians feel that he has been their most representative countryman for above half a century, and that they have lost a leader, the like of whom they cannot hope to see again. Throughout a long life of seventy-eight years, the vigorous poet has been an unwearying champion of national causes—a great patriot and a great democrat.

Björnson was the son of a poor parson, the grandson of a peasant. Born in 1832, he passed the first six years of his life in a desolate region, high up in the Dovre Mountains. Then his father moved to a beautiful, sunlit parish in Romsdal, where views of mountain and fjord filled the boy, he tells us, with ecstasy of joy, but with yearning also beyond his power to explain. There he dwelt among peasants, witnessed their happy, if narrow lives, and developed for them that understanding and sympathy which was later to quicken his tales of the countryside. From the age of twelve to seventeen, he attended school at Molde, where, neglecting study, he steeped himself in the sagas of the ancient North and sought the secret of their sinewy style. Then, with growing pride of nationality, there came to him a vision of a reinvigorated Norway, once more independent and proud. He started a little hand-written paper, and named it *Liberty*. In 1849, he went to Christiania to prepare for the university, and became intimate, amongst others, with Vinje, the peasant poet, the novelist, Jonas Lie, a congenial comrade, and Ibsen, "intense and thin, with complexion like gypsum, underneath a coal-black, extravagant beard." Ibsen's first play appeared in 1848; Björnson's was written in 1851. Significantly, the former dealt with Catiline, and has world-wide appeal; the latter had a Northern heroine, Valborg, and dealt (we are informed) with emigration. After a stimulating sojourn in Christiania, and another year in Romsdal, Björnson finally decided to abandon his father's plan of having him enter the ministry, and arranged to live independently by his pen. In 1853 he began work as a journalist, dramatic critic, and newspaper correspondent. His articles at once revealed an eager nature, provocative of dispute. "Norway for the Norwegians" became his insistent plea, and, thanks to his energy and personal magnetism, he soon rallied an enthusiastic body of young men to his side. Most strenuously he opposed the Danification of the stage, and with such success that after a few years the alien party in control of the Christiania theatre completely lost its hold. Henceforth Norwegian drama was to be presented there by Norwegian actors alone.

During this period, the poet grew steadily, and some of his best literary work was now achieved. Eighteen hundred and fifty-seven is the memorable date of "Synnöve Solbakken," when was inaugurated that series of inimitable peasant tales which is likely to form the chief basis of his permanent fame: "Arne," perhaps the finest of them all, appeared in 1858, "A Happy Boy" in 1860, and "The Fisher Maiden" in 1868. In 1858, he published two saga-dramas, "Between the Battles" and "Lame Hulda," not works of first rate importance, but virile and earnest, and calculated to stir deep feeling in the nation. Already he had visited Copenhagen; in 1860, he travelled to Italy, where he remained the greater part of three years. Thence he sent home other works, among which were two historical plays, a trilogy on the Norwegian pretender "Sigurd Slembe," and "Mary Stuart in Scotland," the latter a distinct dramatic success. "The Newly Married" (1865), a realistic comedy which showed Björnson in an entirely new style, also added greatly to his renown. A yearly stipend was now voted to him by the government, and at the same time he became director of the Christiania theatre and editor of the *Norske Folkeblad*. But his forte was soon seen not to lie in administration: he lacked consistency, discretion, and balance. In 1870 appeared his remarkable epic poem "Arnljot Gelline," in which he represents the forces of heathendom and Christianity in tremendous clash; also another saga-drama, "Sigurd the Crusader," of no great merit; and a collection of "Poems and Songs," where, on the contrary, his lyric genius manifested itself abundantly.

For several years ensuing, Björnson occupied himself chiefly with politics. In all issues he took the radical side, and often aroused bitter antagonism and animosity, not the least because he now deliberately abandoned the narrow orthodoxy of the Lutheran State Church. Though at this time he produced no works of æsthetic value, he advanced in maturity of thought, and emancipated himself in more than one way from the parochialism of his youth. In 1874 an astonished but admiring public witnessed his realistic play, "A Bankruptcy," dealing with the problem of business ethics, which reaches very near the high-water mark of his dramatic achievement. It was soon followed by "The Editor," an open attack on the methods of the defamatory press, which the theatre directors at first found too personal and refused to present. In "The King" (1877) he satirized the institution of monarchy. And continuously since, in play and novel, he has handled present problems of social life. In "A Glove" he repudiated the conventional idea of unequal demands for sexual morality on the part of men and women. In "The New System" he handled satirically, and as if from personal experience, the baneful influences of a petty state on great achievement. "Geography and Love," in a lighter vein, seems like a quizzical acknowledgment of his own self-absorption at the expense of his family. "Beyond Human Power" (1883) deals with the question of faith-healing, and this, its first part (the second appeared in 1899), was as original and powerful a play as Björnson has written. Of his later novels, "The Heritage of the Kurts" and "In the Ways of God" are the most noteworthy. The former is a grimly intense study of heredity, the latter a strong plea for divorce. Björnson's manner in these and in his other recent works is a far cry from that of his youth—realism for romanticism, satire for gentleness. To the end, however, the poet preserved his force of expression, and his latest plays, especially "Paul Lange and Tora Parsberg" (1898) and "Laboremus" (1901), bear witness to his astonishing vitality and versatility.

In 1874 Björnson purchased an estate at Aulestad in Gausdal. There he has lived much of the time since, and there many foreigners have enjoyed his hospitality. Meanwhile he has travelled extensively in Europe, and in 1880 he made a prolonged visit to America. Despite his cosmopolitan associations, Björnson remained to old age Norwegian in every fibre; his style, though always original, never lacked the stamp of national peculiarity.

The characteristics of his early prose recall those of the Old Norse sagas. From them he learned the power of incisive epithet, succinct description, and significant suggestion. In accord with them, he displays impersonality of attitude, willingness to let his characters speak for themselves without comment or preachment on the author's part. In them he also found a model for the use

of lyrics as a constituent part of the narrative, which, notably in "Arne" (where the story may be said to be keyed in one song), contributes so much to the effectiveness of his work. The impression is too often given by critics that these tales, being pastoral and idyllic, are vague and unreal like many other sentimental stories of country folk. As a matter of fact, they are strikingly detailed and definite, although they convey a sense of glamour in situation and their characters seem all more or less poetic in temper. Never have actuality and illusion been more imaginatively blended for the reader's delight. These tales have about them an indescribable charm—that mysterious, appealing something which, as an Old Norse writer says, "it is better to have than to be without." Their simplicity has the complexity of nature, their restraint the distinction of confident art.

In pure lyric verse no Norwegian has equalled Björnson. Beneficent like the sun in the meadow, jubilant and dancing, full of fancy and fire, of earnestness, tenderness, and pathos, Björnson's verses respond to the varying moods of his people. There is something haunting, something of trolldom, both in his joy and melancholy. For Norwegians he is in poetry what Grieg is in music. It is hard to choose examples, when so many present themselves. "Over the High Mountains" voices strongly the deep longing of the limited; "Olaf Trygvason" is admirable in its rapid effect; "Bergliot" is a stirring renewal of a saga-scene; and no one can hear Norwegians sing the national hymn, "Yes, we love that land," without sharing their emotion. It is not that Björnson's lyrics are perfect in technique—many show serious offences against prosody—but their spontaneity and freshness cover their faults. They mount seemingly unbidden from the well-springs of a born poet's heart.

It is in his dramas that Björnson shows most clearly the defects of his qualities. His geniality led him sometimes to swerve from the naturally inevitable when that seemed too severe to ordinary view; out of sheer friendliness he was sometimes inclined to mitigate justice for his characters, and to compromise with logic; implacable fate was beyond his power to execute. His zeal made him a prey to didacticism; his enthusiasms betrayed him into extravagance; his mercurial temperament denied him consistency; his pictorial instinct limited his care for subtlety of effect. He was the people's poet, and he ministered to their needs.

Björnson differs from Ibsen as much as two men living in the same land, age, and general environment could well do. By nature Björnson was akin to Thor, the Northern peasants' god, who gleefully swung his mighty hammer in giantland, ever eager to save the race of men from evil powers—yet naïve, gullible, able to see only one thing at a time, sentimental, insensitive, fond of his kind. On the other hand, Ibsen seems like the heir of Odin, the god of viking chieftains, who from a high seat surveyed the whole world, whilst his ravens, Memory and Thought, perched on his shoulders, whispered words of wisdom in his ear—calm, cautious, critical, caustic, aloof, and alone. Björnson was beloved, to the point of reverence, for his geniality, his ready sympathy, his mighty blows against evil and the foes of his land—primordial virtues. Ibsen was admired, to the point of awe, for his subtlety, his keen intelligence, his dexterity of thrust in combats of the mind, his ability to win renown abroad—virtues of the sophisticated elect. Björnson, it is true, experienced often at home "the proud man's contumely"; but he endured this with little pain, steadily encouraged by the confidence of many supporters: in life he had his reward. Ibsen was long disregarded, if not scorned, by his fellows both high and low; late and reluctant were the honors awarded him: in death his fame grows from more to more.

Two years ago the present writer saw Björnson for the last time. Then, in the course of conversation, the marvellous old man recited a short poem that he had composed many years before, in substance as follows:

I choose April; in it the old falls; in it the new takes root; it brings a little turmoil—yet peace is not the best, but that one something wills. I choose April because it storms and revels, because it smiles and melts, because it force possesses, because it powers upsets—in it is summer born.

"That's it," he said with a smile; "there you have me in a nutsheli. I am an April poet."

WILLIAM HENRY SCHOFIELD.

Cambridge, Mass.

NEWS FOR BIBLIOPHILES.

Among Charles Lamb's associates at Christ's Hospital was John Matthew Gutch. In 1800 Lamb was lodging with him in Chancery Lane, and no doubt they carried on a correspondence for many years though two letters only from Lamb to Gutch seem to have survived. Gutch moved to Bristol and worked his way to distinction as editor of one of the most flourishing provincial newspapers, *Felix Farley's Bristol Journal*. He was a great admirer of the writings of George Wither, and, having a printing office at his disposal, he put many of Wither's poems into type, being, as he says, "encouraged to proceed in his selection by his warm-hearted friend and school-fellow, Charles Lamb." A set of printed sheets, forming two volumes, interleaved throughout with quarto paper was sent to Lamb early in 1810 Lamb's letter, acknowledging their receipt, first printed by Gutch in 1847, is, in part, as follows:

The books have pleased me excessively; I should think you could not have made a better selection. I never saw "Philarctè" before—judge of my pleasure. I could not forbear scribbling certain critiques in pencil on the blank leaves. Shall I send them, or may I expect to see you in town? Some of them are remarks on Wither and his writings. Do you mean to have anything of that kind? What I have said on "Philaretè" is poor, but I think some of the rest not so bad; perhaps I have exceeded my commission in scrawling over the copies; but my delight therein must excuse me, and pencil-marks will rub out.

Gutch, awful vandal! seems to have followed Lamb's suggestion, at least to some extent, and to have copied over these notes in ink on other blank leaves, and then erased Lamb's autograph writing in pencil. He seems to have added also many notes of his own (at least they cannot now be identified as Lamb's), and then to have submitted the volumes to Dr. John Nott, also of Bristol. Nott, on his part, added, in pencil, copious notes and comments, some referring to Wither's writings, others to the manuscript notes by Lamb and Gutch.

Some time after, but probably before 1818, the volumes once more came into Lamb's possession, and he put together portions of his original notes, and printed them in the two-volume edition of his "Works," published in that year, as the well-known essay "On the Poetical Works of George Wither." Then, or later, he seems to have gone through Gutch's volumes again, adding new notes and correcting errors. Dr. Nott's comments exasperated him, and many of these new notes are sarcastic remarks on him and his critical ability, with frequent puns upon his name. At the same time (we may suppose) Lamb signed his initials "C. L." to some of his longer early notes. In two instances he has written "C. L. thus far," indicating that portions only were his. Gutch, writing in 1847, mentions the fact that the volumes went a second time to Lamb, saying: "These pencil marks Charles Lamb afterwards requested the editor to return to him, and they formed the matter of one of his papers in the collection of his works first published in 1818." He does not mention, however, that he himself had erased Lamb's "pencil marks" and copied them over in ink!

Perhaps it was when the books came a second time in his possession that Lamb wrote his name in each volume—the unusual and rare full signature "Charles Lamb"—in Vol. I at the top of the recto of the first of the blank leaves, and in Vol. II on the printed half-title of the book. He then presented the two volumes to James Brook Pulham, a fellow-worker with him at the East India House, and each volume contains an inscription. Pulham is chiefly known as the artist whose pencil drew and needle etched the full length portrait of Lamb which has often been reproduced. Lamb sent one of these etchings to Colcridge on June 1, 1826, and said that the likeness was "stolen from my person at one of my unguarded moments by some too partial artist, and my friends are pleased to think that he has not much flattered me." And, further, "The painter, whoever he was, seems to have taken me in one of those disengaged moments, if I may so term them, when the native character is so much more honestly displayed than can be possible in the restraints of an enforced sitting attitude. Perhaps it rather

described me as a thinking man than a man in the act of thought."

Pulham may have received the books about this time, as he has inserted in Vol. II the original pencil drawing of his portrait of Lamb, and in Vol. I a proof of the engraving, before the lettering was put upon the plate. The second volume also contains an impression of the print, with lettering: "Scratched on Copper from Life in 1825 by his friend Brook Pulham." Pulham is not mentioned in the Dictionary of National Biography, though he seems to have had literary tastes. He brought together a wonderful collection of material, printed, and manuscript, relating to George Wither, and wrote a sketch of the life of Wither, which appears to have been printed. His library was sold shortly after his death, in 1861, and the Grolier Club owns a copy of the Catalogue. The two interleaved volumes of Wither are there described as follows:

Fair Virtue—The Shepheards Hunting—Abuses Stript and Whipt, 2 vols. Reprinted by Mr. Gutch from the editions of 1622.

Interleaved and Illustrated with numerous Manuscript notes by Charles Lamb, by whom the volumes were presented to the late Mr Pulham. The second volume contains the original pencil full-length portrait of Lamb by Mr. Pulham, from which he made his well-known etching.

They brought £2 10s., but the purchaser's name cannot be traced. Later they were acquired by Swinburne and were described by him in his Essay "Charles Lamb and George Wither," first printed in the *Nineteenth Century* for January, 1885, and collected in the volume "Miscellanies" published the next year.

Swinburne seems to have been cautious in describing the manuscript and was, apparently, uncertain as to which of the earlier annotations were in Lamb's own autograph. In fact, in reading his article the impression is received that most of the annotations are autographic. While the volumes were in Swinburne's possession, they were examined by Canon Ainger, and, from his account we are led to think that Lamb's own annotations form the bulk of the manuscript. Lucas, the latest editor of Lamb, seems not to have examined the volumes himself, but reprints Swinburne's description. Swinburne, on his death, gave his manuscripts and books to his friend Watts-Dunton, who promptly disposed of the major part of them, and these volumes of Wither, as well as many of his manuscripts have come to America. The annotated Wither has been acquired by John A. Spoor of Chicago and finds its proper place in his wonderful collection of material relating to Charles Lamb.

Aside from the two presentation inscriptions, the volumes contain on the margins of the printed sheets or on the blank pages of the inserted leaves, many notes and memoranda in ink or pencil, in Charles Lamb's autograph, of which the following are a selection:

VOLUME I.

Facing p. 5. The initials "C. L." (in "a large dancing hand" as Swinburne describes them) and the word "Stuff" affixed to a marked out paragraph above. The Introductory remarks headed "Fair Virtue, or the Mistress of Philarete," which fill the preceding five pages, are certainly Lamb's composition and were, in large part, printed by him in the Essay on Wither in his "Works," 1818. This was apparently originally written by Lamb, in pencil, on the pages facing pp. 7 to 13. Considerable portions of the essay are still decipherable on the blank pages facing p. 12 and p. 13.

Facing p. 48. "Meanly is simply *in a mean* or in *moderation*." This in reply to a note by Dr. Nott.

Facing p. 70. "Endeared?" suggested for "endured" as printed in the line "Jove's endured Ganimed."

Facing p. 76. "Qu. Spenser & Sidney," written below an earlier note "Lodge and Sidney."

Facing p. 122. "Then why give it one?" In reply to an earlier note "The beauty of this passage is too apparent to need a comment."

Facing p. 204. Initials "C. L." The notes to "The Shepherds Hunting" filling the pages facing pp. 204 and 205 were originally written by Lamb in pencil on the pages facing 211 to 215, and much of it can now be read, sometimes the assistance of a glass being necessary.

Facing p. 262. Initials "C. L." The whole of the paragraph, ten lines, is certainly Lamb's composition.

Facing p. 265. Initials "C. L." The paragraph is certainly Lamb's composition. There are evidences of pencil-writing not now decipherable above the note. Very probably this was the original note written by Lamb.

P. 267. "Better spell it rusteling, as in Edit. 1620."

Facing p. 268. "Sadness (*i. e.* Sobriety or Sanity) oppos'd to madness; gladness is quite unantithetical, & meaningless C. L."

Facing pp. 285 and 286. The quotation from Milton at the bottom of p. 285 and top of p. 286 was evidently written by Lamb in pencil on the page facing p. 286, and can still be deciphered. Dr. Nott wrote below this quotation, "Why is this quoted? I see little similarity." When the books came again into Lamb's possession he wrote, in his own autograph: "It was quoted for those who *can* see. I. I. I. I. I. in Capitals—for shame, write *your* Ego thus little l with a dot stupid Nott!"

Facing p. 336. "Damn the Public & you, too, thou Bellua nullius capitis!"

VOLUME II.

Facing p. iv. "C. L. thus far." The matter on the four pages facing pp. 1 to iv was originally written in pencil by Lamb on the pages facing pp. 1 to 4, and portions can still be readily deciphered.

P. xxix. "in the sense of niceness." Explaining a use of the word "curiosity."

Facing p. 56. "I'll be damn'd if Daw was not his name C. L. Explain this line in any other possible way. Not compare himself with the other, why 'tis the commonest way of speaking, if I did so and so I were a greater fool than he I arraign of folly. But I waste words on this Daw of Daws." This in reply to Nott's comment, "I should doubt this," affixed to an earlier note (probably Lamb's) "I take the name of this man to have been Daw."

Facing p. 77. "Pray expunge your observations, or make them a little more pungent." This is in reply to a comment by Dr. Nott, "There is but little pungency in this either."

Facing p. 86. "Shamrocks." A correction for "sham-roots."

Facing p. 108. "Why double-dull it with thy dull commentary? have you nothing to cry out, but 'very dull,' 'a little better,' 'this has some spirit,' 'this is prosaic,' foh! If the Sun of Wither withdraw a while, Clamour not for joy, *Owl*, it will out again & blear thy envious Eyes." This is in reply to Nott's comment, "A very dull essay, indeed."

Facing p. 117. "I, why not, Nott?" This in reply to Nott's comment, "Who would read this satire twice?"

Facing p. 142. "Is anything else dear to you?" This on Nott's note "dear me!" Lamb has also drawn a line under Nott's "me."

Facing p. 183. "Wither has here made a masculine of Pirene, the muse's fountain. C. L."

Facing p. 186. "To smoke like Bacon." Explaining Wither's phrase "to hang at roof."

Facing p. 196. "You damn'd fool!" The long note on the pages facing pp. 196, 197, and 198, was undoubtedly first written in pencil by Lamb, then copied over in ink perhaps by Gutch. Nott observes, "I cannot think the passage deserves so high an eulogium." Lamb's comment on this is short, as above.

P. 297. "The Puritan pokes out his tender horns here."

Facing p. 320. "Bugs (fool) do not here mean fleas' relations. All this is" [continued on next leaf]

Facing p. 322. "Great Poetry, tho' thou knowest it Nott!" This is written in large letters, and is a comment on Nott's note "bugs! Enough to make a man quake," etc.

P. 354. "analogous?! Why, this note was written to show the *difference*, not the *analogy* between them. C. L."

Facing p. 354. "It was meant to be an odd one, to puzzle a certain sort of people. C. L." Nott had written "this seems an odd association."

Facing p. 354. "C. L. thus far." The matter on these pages, facing pp. 353 and 354 is Lamb's and was first written in pencil on the pages facing pp. 359 and 360. Portions are still legible.

P. 372. "In whose style are thy remarks, in the name of modesty? What bit of discovery hast thou made to entitle thee to sit judge upon Common Place. Why Capel Lofft may *keep aloft* from such as thee." This was brought about by Dr. Nott's remark, referring to an earlier manuscript note: "This is very true, but something in the style of Capel Lofft."

P. 378. A long quotation from Sir Thomas Brown facing pp. 377 and 378, was first written in pencil by Lamb, and portions are still legible.

Facing p. 383. "Not so fond as you to catch him tripping. He speaks passionately; you deride coldly. You sin; he never." This in reply to Nott's note, "How very fond he is of this phrase."

Facing p. 386. "don't you? who the devil are you? what are you, & what are you Not? C. L." This in reply to Nott's note, "I do not think this worth quoting."

Facing p. 407. Initials "C. L." This paragraph was originally written on this same page in pencil by Lamb. Nott remarks, "This should be rewritten with more simplicity." Below, Lamb writes, "it should *Not*, Nott! C. L."

Facing p. 460. "Is that all you have to say on this divine Epigram & the following? O Eloquent in abuse! Niggard where thou shouldst Praise! most *negative Nott!*" This in reply to Nott's note "His quatrain stanzas are much smoother than his couplets."

The final history of Gutch's edition of Wither seems to be uncertain. There is, according to Lucas, a copy in the British Museum, in four volumes, the fourth incomplete. On the fly-leaf is written, "This selection of the Poems of Wither was printed by Gutch of Bristol, about 20 years since, and was edited by Dr. Nott. The work remained unfinished, and was sold for waste paper; a few copies only were preserved. 1839." Another copy, which we have examined, is owned in New York. It is in four volumes, with the title, "Selections from the Juvenilia and Other Poems of George Wither, with a prefatory Essay By John Matthew Gutch, F. S. A., and His Life, by Robert Aris Willmott, Esq. Vol. I [etc.] Typ. Felix Farley: Bristol." In addition, the first volume has another title-page, "Poems by George Wither, in four volumes. Vol. I. London: 1839." On the verso of this is the following Preface:

These Poems were many years ago edited and printed at Bristol by Mr. Gutch: Proof sheets being submitted to Dr. Nott, and the celebrated Charles Lamb, who wrote some very pithy comments on the Notes of the Doctor, which have not been printed. The work was never completed, and the whole impression was consigned to the "Tomb of the Capulets" and supposed to be effectually destroyed. Now, however, by the resuscitating powers of sundry Bristol Book Chapmen—"Monsieur Tonson's come again!" etc.

Signed "J. R. S." and dated "London, 1839."

Very few copies could have been made up by the "Bristol Book Chapmen," as the Life by Wilmott has been broken from his "Lives of the Sacred Poets."

Swinburne, unfortunately, has not written his name in the books, as his association with them adds to their interest. One slip of paper used by him as a marker contains two or three words in his autograph.

Correspondence.

CULTURE AND DEMOCRACY.

To the Editor of The Nation:

Sir: I do not need to tell you that the reports of my recent address in Pittsburgh have, by piecemeal quotation, conveyed an entirely false impression. You yourself have made allowance for this distortion in your kind editorial of this week. The criticism embodied in that editorial is quite just, if the speech be interpreted as you have interpreted it; and I must say I cannot blame you for the misinterpretation. Unfortunately, my mind is a one-track affair on which I can run only one through train at a time. Some of the trains are scheduled in the newspapers because they seem to contain sensational matter. The rest are ignored. I can only assure you, therefore, that I entirely agree with the views of your editorial. It would be inexcusable for any man responsible for the administration of a university to overlook the value of culture and of all that quiet and deeper development of the mind which displays itself in personal poise, in quiet insight, in the finer forms of intellectual power, rather than in public service and material achievement. I can agree with your editorial, because I am not guilty as charged.

If culture be the intimate and sensitive appreciation of moral, intellectual, and æsthetic values, I heartily agree with you that the production of men capable of these deeper insights is one of the things most to be desired in the life and influence of a university. My difficulty is on the side of organization. For, after all, culture is not a thing produced in classrooms, but by the subtler influences of life and association among men of the finer sort of taste and the higher kind of learning. I wish very much that from some quarter, light might be thrown upon the processes by which a university may produce those subtle atmospheric influences in which culture thrives, while the spirit of service and of achievement is not dampened or slackened.

I beg that you will not believe that because I seem incapable of stating more than one side of a question in any one speech, I do not know and appreciate the other side.

Woodrow Wilson.

Princeton University, April 21.

To the Editor of The Nation:

Sir: Far be it from me to inform the *Nation* on the interpretation of President Wilson's ideals for colleges in America. But, so far as recognition of the masses rather than the classes and the omission of culture as an end in itself go, is it not true that a young nation requires a different instruction from an adult or mature one? If President Wilson, looking about him, sees that the present need of college training lies in the democratic broadening rather than the intensifying of sensibilities, does it necessarily follow that he is an enemy to the refining influences of culture in the individual? Has it not been Dr. Eliot's effort to do away with "exclusiveness" at Harvard? Not that "choice spirits" in themselves are not the earth's best answer to "culture," but America is still laying foundations, and the college boy for generations to come must help to lay foundations. The country needs now not "choice spirits" so much as practical, honest, disinterested, informed public servants.

G. Wallace.

New York, April 21.

QUOTATIONS IN CONGRESS.

To the Editor of The Nation:

Sir: Having had occasion lately to turn over the pages of the *Congressional Globe* for a number of years during the anti-slavery controversy, I took the opportunity to note the use our legislators made of the anti-slavery literature. As a student of Lowell and Whittier, I had often wondered (the more so as poets, if there are such, in reform circles of to-day have little weight in determining public opinion) how far their voices carried in the din of controversy.

I found several poetical passages which were not familiar. Amos Tuck of New Hampshire, on January 19, 1848, in a speech on the President's message, quotes the following lines:

> We know no crime in colored skin,
> Nor think the God above
> Could fix the brand of slave upon
> The children of his love.

In the same speech:

> We ask not ye shall snap the links
> That bind you to your dreadful slaves;
> Hug if you will a corpse that stinks,
> And bear it with you to your graves:
> But that you *may* go coupled thus,
> You never shall make slaves of us.

And again this version of the Latin lines:

> We know the right, and we approve it too;
> We know the wrong, and yet the wrong pursue.

J. J. Slingerland of New York, in a speech on internal improvements, delivered June 22, 1848, applies these Hudibrastic lines to the candidate for the Presidency, Lewis Cass:

> He wires in and wires out,
> And leaves a body still in doubt
> Whether the snake that made the track
> Is going south or coming back.

When John Quincy Adams, on January 25, 1842, introduced the Haverhill petition, perhaps drafted by Whittier, for the dissolution of the Union, he was addressed by T. W. Gilmer of Virginia as one

> Who, in the course of one revolving moon,
> Was poet, fiddler, statesman, and buffoon.

Characteristically, these lines are quoted on February 3 by Adams as gracing a cartoon of himself, which he exhibited to the House, at the same time commenting caustically upon the variant "babbler" substituted for "fiddler," the second line reading, "Is statesman, poet, babbler, and buffoon." In the same speech Adams expresses the hope that the Virginians may feel

> That holy shame which ne'er forgets
> Whose blush remains when virtue sets,
> To show her sunshine has been there.

I do not know the source of these lines, though the sentiment is familiar enough in both Whittier and Lowell.

I found only one quotation each from Lowell and Whittier. J. G. Palfrey, in a speech on the Territorial Governments, delivered February 26, 1849, quotes, with picturesque application, the lines from "The Pine-Tree":

> Sat with Bibles open, around the council board,
> And answered a king's missive, with a stern
> "Thus saith the Lord!"

To-day the lines are printed:

> Sat in council with their Bibles round the board,
> Answering England's royal missive with a firm,
> "Thus saith the Lord!"

Two days later, J. M. Niles, debating the same subject, quoted the familiar stanza from Lowell's "Stanzas on Freedom," beginning:

> They are slaves who fear to speak.

Dr. Channing is the only anti-slavery writer whose name I saw on the pages of the *Globe*. Isaac Hill, from Virginia, in the Senate, February 12, reprobated the introduction of Dr. Channing's book, obviously on slavery, into the Senate. I have not been able to find the speech referred to. On February 9, 1839, Senator Morris of Ohio, speaking against the contemptuous treatment of petitions, points out the moral pollution of slavery, saying:

> I have deeply deplored this stain upon our national morals; and the words of Dr. Channing have, thousands of times, been impressed upon my mind, that "a slave country reeks with licentiousness."

Quotations from the classic English poets are rather abundant, especially from Shakespeare; lines from Goldsmith and Pope also often occur. I do not know how many times I ran across the familiar

> Vice is a monster of so frightful mien.

There seems, as it were, an occasional epidemic of verse, a subject perhaps for the student of psychologic suggestion. Twice in the same volume the phantom of secession is challenged:

> Never shake thy gory locks at me;
> Thou can'st not say I did it.

And surprising, indeed—in the same volume occurs twice the swelling story of the seven in buckram. But this is a digression.

Of course, the question here raised is not the general one: What was the influence of such a man as Whittier? To the answer of that many other circumstances must contribute. But the facts here brought together may be regarded as indicative of the degree of importance attached by practical politicians to the outbursts of the muse; then as now slight. I confess a sense of disappointment that I did not once hear the homely accents of Hosea Biglow rebuking corruption and silencing cant.

Wm. H. Powers.

ONE WAY OF MAKING TEXT BOOKS.

To the Editor of The Nation:

Sir: In view of the deluge of text books which floods the educational world every year, it would be well to decide just how far it is legitimate to use the "scissors and paste-pot method." An interesting phase of the question may be illustrated

by the procedure of Messrs. Kastner and Atkins in their "Short History of French Literature," which has been quite favorably received. The preface makes the following statement in regard to the authors' indebtedness:

All the leading authorities on French literature, among whom may be mentioned Gaston Paris, Darmesteter, Lanson, Brunetière, Faguet, and Jules Lemaître, have been consulted, and in the case of the most conspicuous writers, the criticisms expressed are based on a first-hand acquaintance with their writings, supported, where possible, by the internal evidence of the works themselves.

The parallel passages given below are not the result of any painstaking search, but merely the outcome of a few days' reading of Lanson's "Histoire de la littérature française," and Derechef's translation of Brunetière's "Manual of the History of French Literature." Other passages might have been cited showing the same similarity. No attempt has been made to find parallels in other secondary sources mentioned by the authors. With the exception of the paragraph quoted above there is no reference to the source of these passages, nor are quotation marks used.

The works of Marot are composed: (a) of translations and allegories, such as the translation of the first two books of the "Metamorphoses," and his "Temple de Cupido," or again his "Enfer"; (b) of *chants royaux, ballades,* and *rondeaux*; (c) of occasional pieces, *étrennes, blasons, complaintes,* etc.; (d) of his translation of fifty of the Psalms. p. 46.	The works of Marot are composed: (1) of Translations and allegories, such as his translation of the "Metamorphoses," bk. I. and II., and his "Temple de Cupido," or again his "Enfer";—(2) of *Chants royaux, Ballades,* and *Rondeaux*;—(3) of *Elegies, Epistles,* and epigrams;—(4) of occasional pieces that figure in anthologies under the titles *Etrennes, Epitaphes, Blasons, Cimetières,* and *Complaints*;—(5) of his translation of fifty of the Psalms. Brunetière, p. 42, note.
His learning is that of the Middle Ages: (a six-line quotation follows) p. 46.	Son érudition est du moyen age: (the same quotation) Lanson, p. 237.
He was lacking in intensity of feeling, picturesqueness of vision, and vividness of style. p. 47.	Marot possessed neither the intensity of feeling, nor the picturesqueness of vision, nor the vividness of style of a poet. Brunetière, p. 41, note.
(Of the "Amours de Cassandre") . . . and partaking rather of the artificial character of old French "courteous" poetry than of the passionate character of modern lyricism. p. 63.	It partakes rather of the artificial character of the "courteous" poetry of our old literature than of the passionate character of modern lyric poetry. Brunetière, p. 58, note.
Moreover, we know that Malherbe's finest poems, which during his lifetime were scattered through, and to some extent lost in, the anthologies of the day, did not appear in collected form till 1630, two years after his death, and that he did not leave any disciples rightly so called. p. 96.	To . . . since his finest poems, which during his lifetime were scattered through and to some extent lost in the anthologies of the period, did not appear in collected form until 1630, two years after his death. Brunetière, pp. 112-113. . . . that he does not appear to have left any disciples rightly so called. Note, p. 120.
It would be almost impossible to be more deficient than he is in enthusiasm, imagination, sensibility, and naturalness. His ideal, as was the case with Ronsard as he grew older, tended towards the entire elimination of the personal element from poetry, and	It would be impossible to be more deficient than he is in enthusiasm. . . . His want of imagination. . . . His want of sensibility. . . . Finally his want of naturalness. His ideal, as was the case with that of Ronsard as he grew older, tended towards the entire elimination of the personal element from lyricism;—and in consequence to transform lyricism into oratorical verse. . . . This transformation responded exactly to the taste of the time. Brunetière, p. 19, note.
After the affirmation of his thesis Perrault attempted to prove the truth of it in the famous "Parallèles des Anciens et des Modernes" (1688-1699), adducing six principal reasons for the superiority of the moderns; the fact that they came later; the greater exactness of their psychology; their more perfect method of reasoning; the art of printing; Christianity; and, finally, the protection of the king.	Il y a six causes qui font les modernes supérieurs aux anciens dans la littérature; le seul fait d'être venus les derniers, la plus grande exactitude de leur psychologie, leur méthode plus parfait de raisonnement, l'imprimerie, le christianisme, et enfin la protection du roi.
From the first Fontenelle had sided with Perrault. . . . p. 156.	Aux côtés de Perrault s'était rangé dès le premier jour Fontenelle. Lanson, p. 592.
But at bottom Boileau was in a false position; he was a modern himself. . . . p. 156.	Au fond, Boileau était dans une fausse position: il était très "Moderne" lui même. Lanson, p. 593.

One of the most surprising things is that the editors have seemingly preferred to excerpt from the English translation of Brunetière's "Manual." It should seem that in the case of some of "the most conspicuous writers the criticisms expressed are based upon a first hand acquaintance" with Lanson and a second hand acquaintance with Brunetière.

A PATTERN FOR PARENTS.

TO THE EDITOR OF THE NATION:

SIR: For those who, passing on the lamp of culture to the youth of our best families, sometimes deplore the influence of home in hindering that high endeavor, the incident here told may be of comfort. Here, at least, let a parent be held up, who realized his duty, and, by his own standard, measured up to it.

I had occasion recently to take to task a gilded creature of New York's best making, for his total lack of those things, the sartorial excepted, which go to make a man polite. I urged upon him that a college junior who wrote, "We eagurly clamored down the rocks an found he was alright," was wasting his imagination. At the institution which I served we were content to turn out bad spellers of the common kind, but we discouraged originality in any form; and he really must conform more closely to our mould. This, with other things, I told the junior from New York; mark what came of it.

Yesterday he called on me and said: "I told father when I was home vacation what you said, and you know what he done? He fished out a twenty-dollar bill, and said, 'My boy, go buy a spelling-book.'"

Such straws as these foretell a change of weather, surely, and must bring gladness to the hearts that are sighing, "Western wind, when will ye blow?"

SCHOLEMASTER.

A QUESTION OF GRAMMAR.

TO THE EDITOR OF THE NATION:

SIR: When I went to school we were taught (with great difficulty) that a definition could not run: "Synalœpha is *where* the final vowel of a word is elided before another word beginning with a vowel." Instead, we were made to say: "Synalœpha is the elision, etc." Now, in F. B. Gummere's "Handbook of Poetics" I find several instances of this fashion of definition. On page 105 he writes: "A simile, then, is *where* two objects are presented to the mind for comparison." Since the author is a professor of English, it must, of course, be done advertently. Logically, it seems to me inadmissible; still, I should welcome any adequate authority that would make it possible to indulge the natural inclination of the human mind toward this form of definition.

Text Books.

EDUCATION AND PSYCHOLOGY.

"Habit Formation and the Science of Teaching," by Stuart H. Rowe (Longmans), has two purposes: first, to present more fully than has been done in any previous book the psychology of habit; and, secondly, to treat the subject of habit-formation in such a way as to point out to the supervisor or teacher its application to the daily work of the schoolroom. Organization of experience is the underlying process in learning, and this results in ideas and habits. These two types of experience are entirely different. "The first great principle in scientific teaching is to analyze the subject-matter and determine what elements in it are to become habitual." Four important considerations with reference to habit-getting are these; there must be a careful consideration of the habit to be formed; there must be in the mind of the pupil an idea of the habit and of its value to him; there must be abundant practice; and all exceptions must be prevented. Each of these essentials is worked out in much detail in a separate chapter. The author shows that bad habits are best removed by substituting for them good ones. The brief chapter in which the general principles of habit-formation are applied to school discipline and to moral training is one of the most helpful in the volume. The book is, of course, written primarily for the teacher and should be of distinct service in focusing attention upon the importance of habit in education and of planning for its development. But the lessons it contains are for the parent no less than for the teacher. Condensed and stripped of technical language it might be helpful in bringing home to fathers and mothers the importance of a training for which they seem to hold themselves less and less responsible.

"High School Administration," by Horace A. Hollister (Heath), discusses a large number of the problems connected with the organization and management of public high schools in this country. After an historical survey and some discussion of the legal status of the high school, the author

reaches the central theme of his book—the programme of studies. The school is organized for the presentation of this programme, and out of it arise those questions of administration which are here discussed. A wide knowledge of the conditions at present existing in high schools, both large and small, and an eminently sane and moderate statement of some topics which are frequently subjects of controversy, characterize the book. Perhaps the schools of the Middle West are more frequently and more largely in the author's mind than those of the East. The relation of the high school to the college is presented with fairness to both sides. The chapter on examinations is calculated to emphasize a qualitative rather than a quantitative basis of rating for pupils. The book should prove of large value to beginners in administrative high school work, and will be found very suggestive to all workers in the field of secondary education.

Dr. Felix Arnold's "study in psychology and education," entitled "Attention and Interest" (Macmillan), suffers apparently from having attempted too much in one direction and too little in another. It aims "to clarify and arrange the many facts that have been brought to light in the psychological laboratories" on its subjects. But this task has fallen considerably beyond the author's competency, as it exceeds the power of every living psychologist. Dr. Arnold has gathered his facts well, and his schematic division of them shows no little skill; but much is left to be sighed for in the way of lucidity. On the other hand, in feeling himself "bound not to uphold any special theory or school, but present the facts as they seem to be," the writer suffers from a paralyzing conscientiousness or else timidity. What is known about attention and interest simply cannot be presented, at this hour, save largely in terms of what is conjectured. Simply to tell off the results of many experiments is to leave the student in worse confusion than before, inasmuch as the very methods of investigation frequently presuppose some general working hypotheses. When Dr. Arnold turns to the practical bearings of his psychological topics, he is at his best, but here unfortunately at his briefest. Part iii, dealing with the teacher's application of psychological discoveries, fills only one-ninth of the volume.

Its classical forms all notoriously outworn and unserviceable, Sensationalism is made over by Prof. Edward Bradford Titchener. Neither Locke nor Hume nor Mill would recognize more than its name in the Cornell scientist's "Lectures on the Experimental Psychology of the Thought Processes" (Macmillan). The last word of the title gives the leading clew to the lines along which the old psychological doctrine of England has been recast; it is not what men think, but rather what goes on when they think that concerns the experimentalist. In confessing himself guilty of a sensationalistic bias, Professor Titchener enters the mitigating qualification that this bias means "simply that psychology prefers to work with as few tools as possible, and that . . . sensation and affection together seem to give it all it requires for the work of analysis." Sensationalism, therefore, is for him "an heuristic principle and not a creed"; and the present volume attempts to justify this limited faith by its works, as these have, during the past nine years, been rapidly accomplished under the leadership of Marbe in Germany and Binet in France. Viewed merely as a digest of contemporary psychological investigations and theories about the nature of thinking, Professor Titchener's book is one no student of the subject can leave unread. It is, however, much more than a summary; it is a vigorous defence of the laboratory method as the most profitable attack upon the secret ways of our most complicated and fleeting mental processes. In sharpening the issues between his own hypothesis and that of "imageless thinking," Professor Titchener is at his best, because at the crisis. His notes alone on this and its implicated problems constitute almost a complete bibliography of the field. His running fire at his opponents lights up the whole scene, but does not scorch.

In view of their inevitably limited range and rather predetermined style, text-books on logic multiply amazingly. One might reasonably suppose that, long ere this, the ideal elementary treatise had been penned and generally recognized; yet, among teachers, the sighing for something better in the way of an introduction to the reasoning art is perennial. The trouble is that the logician is by profession addicted to niceties; he wants his students to have a book as neat and as well hinged as his own finished thoughts; but the students, who have yet to acquire the logical virtues, learn unwillingly and little from such a work. Grace, pretty illustrations, amiability, and comments on the doings of the hour are called for by the pampered learner. Recognizing this dilemma, several recent writers have chosen the student's horn of it; of their books no other seems quite equal to the latest of the group, which Prof. Boyd Henry Bode has just written. "An Outline of Logic" (Holt) conveys all the elements of the science down an agreeable stream of talk about the reason and unreason of our contemporaries. Professor Bode is as informal as an expounder of logical formalities dares be without losing caste; but he does not expound loosely. He does not reprint the good old modes of the schoolmen. He does not even quote Mill by the page—an achievement much to be respected. Nearly half the volume consists of clippings from newspapers and magazines of recent date, with the author's appended analysis and criticism of their reasoning. The exercises at the back include the old but ever useful common properties of logic interspersed among paragraphs from the Interstate Commerce Commission and its critics, from Mrs. Eddy, from the stand-patters, from biology, and from disciples of table-rappers.

ENGLISH.

William J. Long's much-heralded "English Literature" (Ginn) is a thoroughly animated and readable text-book. Its shortcomings are mainly unavoidable in any brief history which possesses the virtue of a definite, personal point of view. Excluding what he cannot vitalize, Mr. Long leaves the fifteenth century blank; a sound moralist, he passes the Restoration period with bated and uncommunicative breath; romantic, he treats the whole school of Dryden and Pope with a harshness now a little archaic. He arranges his material, however, and in general characterizes literary movements and individual writers with clearness and distinction. Never dull, and seldom trite, he speaks of a great variety of men and books with that desirable gusto which provokes the reader's appetite. To these spiritual values must be added frequent tabular views of literature and history, select but ample bibliographies for each period, a jolly lithograph of the Canterbury Pilgrims, with many other stimulating illustrations, Prof. W. L. Phelps's literary map of England, and an index. It would be difficult to name another book of similar intention and compass which more happily unites method and solidity with humanity and grace.

Prof. W. E. Simonds, already author of a useful "Student's History of English Literature," now presents as a companion volume "A Student's History of American Literature" (Houghton Mifflin). Largely derivative, and somewhat academic in treatment, it has the merit of presenting some of the "best that is known and thought" about our colonial writers and our perpetual "classics"—Irving, Cooper, Bryant, and the rest. In the longer articles, Professor Simonds attempts too much detail for the best effect. Falling a little into the chronological style of "Who's Who," he sacrifices contours, lights, and shadows to mere inclusiveness. His last chapter, dealing with the living and the recently dead, was doubtless intended to add a note of freshness and timeliness; but it had been much better omitted. Its sins of inclusion and exclusion are inexplicable, and, after all, its twenty-five pages are only an unedifying mass of names, titles, and dates. The historian of so brief a literature as the American must either orient himself and steer boldly and wisely among the living, or else wait another generation for Old Mortality.

Among the new English texts we note the apearance of Walter C. Bronson's "English Poems" of the Elizabethan and the Puritan period (University of Chicago Press). This full and admirable selection is the second in his proposed series of four volumes. Shakespeare is represented by "Hamlet" and "The Tempest" in the New Hudson edition (Ginn); by "Henry V" and "A Midsummer Night's Dream" in the "Lakeside Classics" (Scott, Foresman), and by "Richard II," "Julius Cæsar" and "Macbeth" in a single volume published by the Clarendon Press. Debaters will be interested to find in P. M. Pearson's "Intercollegiate Debates" (Hinds, Noble, and Eldridge) a collection of briefs and reports of all the important contests of the past year. It is a great pleasure to announce that F. C. Prescott's "Selections from Poe" (Holt) is not another edition of the Gold Bug, etc., but a well-chosen and well-edited volume of Poe's most important critical writings.

There is something almost communal in the composition of rhetorical text-books—*das Volk dichtet*. The rhetorical "movement" this spring is characterized by two auspicious tendencies: the omission of the word "rhetoric" from the titles, and the emphasis upon the use of models. Both signs indicate an attempt to win the confidence of the student, and to get closer to the actual business of writing. Thus Prof. Charles Sears Baldwin's substantial tome is called simply "Writing and Speaking" (Longmans), a title which puts the whole matter on an eminently practical base. Perhaps the most salient feature of his treatment is his reduction of all rhetorical

virtues to Clearness and Interest. The most valuable feature is his attention to the possibilities of mutual helpfulness existing between oral and written composition. "A College Course in Writing from Models," by F. C. Berkeley of the University of Wisconsin (Holt), is another collection of "specimens," such as the last two or three years have been fruitful in. Mr. Berkeley's development of the type consists in a not very strenuous or brilliant set of exercises adapted to the models. The step, however, is in the right direction. Professor Canby and four colleagues of the Sheffield Scientific School have put out an "English Composition in Theory and Practice" (Macmillan), which endeavors to combine richness in specimens with fulness in precept. The "hit" of the book should be the structure of a brief, represented diagrammatically in the form of a railway trestle for the better comprehension of engineers. On the whole, the best book of the season is a fully revised edition of Scott and Denney's "Paragraph-Writing" (Allyn & Bacon) —a really original work, an exception among scores which have no reason for being—beyond the impulse, innate in every teacher of composition, to increase and multiply.

One young writer in a hundred will find a kind of gospel inspiration in Joseph Russell Taylor's "Composition in Narration" (Holt). In all probability that exceptional one will be as well worth saving as the ninety-nine others who take the dusty highway to salvation. The author of this unique and personal little treatise believes that the teacher of composition should himself be a writer. He should attempt to induct his pupils not into the rules, but into the creative and artistic spirit. The power to write as artists write, he believes, arises not from obedience to the rhetorical decalogue, but from a trained vision, imagination, and experience. The method and intimacy of his counsels the following passage will illustrate:

> Years ago, in old vacation swimming days, and in a prosy little Western river, I used to swim across to the diving log with a notebook and pencil in my teeth; these instruments were deposited on the log; and up from every dive I came to scribble in the notebook another wet-fingered phrase or two, of the underwater world, of how the sun looked like a lamp in a dome, of how my swimming comrades were turned golden, green, beautiful! for I was writing a poem on Hylas and the nymphs. So in another year I was writing upon a theme whose symbol and image was the wind blowing, and, of course, a girl in the wind; I watched five seasons through, watched and caught at and tried to express those beautiful living images. I remember an undated midwinter in Chicago—or was it New York?—when at the corners of those deep city cañons every woman became, this instant and that, statuary beautiful as the winged Victory. . . . If I may paraphrase Stevenson, that, like it or not, is the way to learn to tell the truth; whether I have profited or not, that is the way. Live it out for yourself, and all these things shall be added unto you, the rules and the rules, as you grow in wise experience of your own life.

GREEK AND LATIN.

The student of Greek, no less than the student of archæology, has long needed a book that would give in English a brief and more or less popular survey of the progress made so far in the study of all branches of Greek archæology and art. That progress, owing mainly to excavations carried out in the past generation, has been immense, but the results have not been easily accessible to the English reader. The "Handbook of Greek Archæology," by Prof. H. N. Fowler and J. R. Wheeler (American Book Co.), is the latest addition to the college series edited by Professor Smyth, and is an excellent introduction to the whole field. Architecture, sculpture, terra-cottas, metal work, coins, gems, vases, and painting are all treated, architecture with especial minuteness in the chapter contributed by Gorham Stevens. In a volume of only five hundred pages, which is moreover copiously illustrated, one hesitates to complain of omissions. But surely the chapter on Pre-Hellenic Greece, which tells us so much about Mycenæ and Cnossus, might have included some account of Hissarlik, a word which does not occur in the index. Yet, for most readers, that great site is of all others the most interesting. Cnossus has indeed given us far more remains, but Cnossus is not the background of the masterpiece of epic literature, and will never permanently fix the attention of the whole world, like Troy. In the chronological sketch of Crete the dates given are those adopted by Eduard Meyer, which are later than those proposed by Dr. Evans. There is a useful bibliography, and the illustrations are admirably reproduced. The book will no doubt take its place, for some time to come, as the standard short English handbook on this great subject.

An interesting attempt to convince school boys of the living force of the Greek language, and to make its acquisition what it ought to be, an exercise in ingenuity and an intellectual game, at least in the early stages, is being made by Dr. Rouse, the headmaster of the Perse School, at Cambridge, Eng. In his "Lucian's Dialogues, Prepared for Schools" (Frowde), he offers, first, a small volume containing most of Lucian's dialogues, with the necessary omissions, the syntax modified to accord with the normal Attic. As Lucian was the most skilful of all the Atticists, the modifications are mainly in the use of ἄν and a few particles To be used with this he has arranged a little volume of notes to explain all the important words and allusions. The new departure consists in the fact that these notes are written in Greek. At first sight they repel like the Greek scholia, but unlike scholia they are composed in Greek so simple that they need not daunt a student in his first year of Greek. They are intended to fix the grammar by use, to enlarge the vocabulary, and to do away with the use of a dictionary, which Dr. Rouse calls a "time-wasting device." The essential thing is that the whole lesson is conducted in Greek, and that translation into English is reserved for home work, and is written. Dr. Rouse gives a full description of the method which he has for some time followed with success. For most American schools it would probably demand more time than is usually given to the subject, but where time can be spared there is no doubt that here is an excellent way of securing the interest of the students, and there can be no better author than Lucian for the experiment. The "Anabasis," which hardly ever attracts the young, could then be discarded altogether, and a boy who is to have only one year of Greek would at least have pleasant and vivid memories of the experience.

Prof. Carl Darling Buck's "Introduction to the Study of the Greek Dialects" (Ginn) supplies, for the first time, in a single volume (of 300 pages), the needs of those who desire to appreciate the wide range of speech in the Greek world. Even those who are deeply read in the Greek classics will have met few of these dialects in literature, and there is no reason why their acquaintance should be reserved for special students of inscriptions or for those who write critical studies of dialect for the doctor's dissertation. An admirable general grammar of the dialects is followed by a selection of inscriptions with brief footnotes. The Glossary supplements Liddell and Scott, now of course hopelessly out of date in this as in several other fields. There are useful charts and a dialect map.

Prof. Charles E. Bennett's "First Year Latin" (Allyn & Bacon) is intended to prepare the pupil for the intelligent study of Cæsar, and the vocabulary is chosen from the commonest words used in the "Gallic War." The arrangement of the material falls into line with the ordinary Latin grammar, so that there need be no readjustment of the pupil's mind in the second year of grammar work. The lessons are followed by Book ii of the "Gallic War," with footnotes and a map. Professor Bennett lays stress on the necessity of learning the declensions and conjugations thoroughly at the outset, and on the advantage of oral drill over written work on the forms.

MODERN LANGUAGES.

Racine's "Phèdre," edited by Irving Babbitt (Heath), is a model of compact and skilful work, the introduction and the notes alike bearing on the text in an illuminating way. The introduction attains real distinction. It is an essay, not merely by courtesy, in which are expounded (1) Racine's life; (2) his art; (3) the special literary problems presented by "Phèdre." Most suggestive of all is Part ii. Here the editor explains the relation between classic and neo-classic art, and traces the over-refinement of manner manifest in French tragedy back through the artificial pastoral romances ultimately to the conscious poses of Petrarch. Part iii furnishes a comparison of "Phèdre" with its chief sources, the "Hippolytus" of Euripides and the "Phædra" of Seneca. This part, valuable as it is, could easily have been improved if Professor Babbitt had inserted the main lines of all three plots; in that case Racine's relations, in the large, to his predecessors would have become more apparent. Such matters can, it is true, be inferred from the well-chosen extracts, given in the original Greek and Latin, together with translations, which form a part of the notes.

"Les Maîtres de la critique littéraire au XIXe siècle," by W. W. Comfort (Heath), is a collection of twelve French critical essays, so chosen as to suggest the trend of French criticism throughout the nineteenth century. Such a volume, even though we admit that the selection is not always quite skilful, is bound to be so useful that one must regret the lack of a general historical introduction. This could have been made unusually precise by means of illustrative

references to the French text. The book contains a number of misprints.

The new series, known as "Crowell's Shorter French Texts" (Thomas Y. Crowell) now includes twenty-four volumes. Provided with a brief introduction in French and with exercises requiring comments on the text in French, each volume aims to surround the student with a strictly foreign atmosphere; the illusion is carried still further by the un-English sounding names of most of the editors. It must be said, however, that the series throughout presents the appearance of slightness: the texts are intentionally very short; so are the notes (three of Molière's plays, which, by the way, seem out of place in any series for very young readers, receive but a page apiece), and also the vocabularies, which are awkwardly arranged, page by page. In general, the selections are drawn from obscure works.

Of French grammars and compositions there is the usual variety. Chardenal's "Complete French Course" (Allyn & Bacon), which now appears in a new, revised edition, shows a gain from having been expunged of its ambiguous sentences; it will continue to be a book of great practical value for secondary schools. Scarcely less important is the "French Composition," by William Koren (Holt), which is designed primarily for colleges. The book appears to be superior to the previous work by Vreeland and Koren, in that from the very start composition is based upon passages of French text. Part ii, especially, comprising large excerpts from "Le Voyage de Monsieur Perrichon," with the accompanying composition, offers good practice in variety of expression.

C. F. Martin's elaborate treatise on "The French Verb" (American Book Company) is hardly likely to gain a foothold in many schools or colleges. Though the importance of the verb in French is not to be denied, the advantage of devoting the 230 pages of Part i to scarcely more than mere conjugation is not apparent. The exercises and observations in the rest of the book also seem a bit fussy and futile.

Much learning of the useful sort is manifest in "Common Difficulties in Reading French," by C. C. Clarke, jr. (William R. Jenkins Co.). It is a book to which one may refer with great convenience, owing to the alphabetical arrangement of the matter, for the more frequent idioms of the language. In grammars these are likely to be treated more inaccessibly.

In the series of Spanish Readings, under the direction of Prof. J. D. M. Ford (Holt), appear "La Mariposa blanca" of Selgas, edited by H. A. Kenyon, and "Tres Comedias modernas," edited by F. W. Morrison. To students of Spanish the latter of the two books will doubtless be the more welcome, as the plays which it contains are in every way charming; by comparison, "La Mariposa blanca" seems melodramatic.

Professor Cusachs of the Naval Academy, with his edition of Valera's "Pepita Jiménez" (American Book Company), reintroduces us to an old acquaintance, this story having been already edited for the Heath Series in 1908 by G. L. Lincoln of Harvard. The pages of pseudomysticism of the first part, wisely excised in the previous edition as being too subtle for mere beginners in the language, are here found in full. The notes add nothing new, and throughout are slight.

A volume of first German readings, by P. S. Allen, bears the inviting title "Herein" (Holt). Design and method are worthy of emphatic approval. The editor has skillfully attained simplicity without silliness and without sacrifice of idiomatic flavor, even at the beginning. A genuine German atmosphere pervades the book, tempered but not impaired by American common sense.

A new edition of Schiller's "Jungfrau von Orleans," by P. S. Allen and S. T. Byington (Ginn), is chiefly distinguished from its numerous predecessors by a more scrupulous Vocabulary, and by more attention, in the interpretation of the play, to sources and literary analogues. Summaries of the successive scenes are transmitted from Bellermann "without subterfuge—and without water." This explanation is not a little surprising. Why dilute Bellermann? The application of a sharper reagent than water would improve his analyses, excellent as in many respects they are. This edition aims consistently at sympathetic appreciation. Some stimulation to a critical attitude would surely make the study of this drama more instructive. One might, for instance, raise the question whether there is any difference between epic and dramatic poetry in respect to a catalogue of the ships; and one might safely go farther than to characterize Montgomery as "somewhat of coward, or at least capable of deep discouragement in war."

Among many new editions of favorite prose narratives, F. W. J. Heuser's "Höher als die Kirche" (Charles E. Merrill Co.) is an example of minute attention to details. To secure a Vocabulary perfectly adapted to his text, Mr. Heuser did not disdain translating the whole story into as good English as he could command. His annotations seem unnecessarily ample. A special and commendable feature of his book is a series of original exercises based upon a systematic presentation of principles of syntax as they are found illustrated in the first chapter. The book is well fitted for a combination of intensive with extensive methods of instruction.

"Exercises in German Syntax and Composition," by Marian P. Whitney and Lilian L. Stroebe (Holt), strives to develop in advanced students the capacity for treating literary subjects in German. Most books of exercises are concerned primarily with colloquial idiom. This one illustrates fundamental syntactic matters by a series of well-chosen paragraphs about poets or poetic works, each accompanied by a paraphrase for translation into German. A second part consists of an equally excellent series of short paragraphs, chiefly by American writers, on German subjects. Part third contains a number of literary topics for free thematic composition. Students who can profitably use this book must certainly be advanced. The translation of idiomatic English into idiomatic German is not easy; and not all students will find all the aid they may need in the Vocabulary to these exercises. All students will, however, be impressed by the dignity of the goal here set before their eyes; and whoever under criticism conscientiously works through these exercises cannot fail to acquire considerable power of expression in literary style.

Calvin Thomas's "Anthology of German Literature" (Heath) ranges from the "Hildebrandslied" to the youthful works of Schiller. Monuments antedating the Reformation appear in modernized German versions, in part by the editor. The volume is handy, and the selections are representative, and are elucidated, so far as appears to be necessary, by judicious notes.

HISTORY.

Teachers of history in secondary schools will find much food for thought, and, if they will, a deal of chastening and inspiration, in M. W. Keatinge's "Studies in the Teaching of History" (Macmillan). Unlike most American school men who have written so prolifically of late on the best method of teaching history to boys and girls, Mr. Keatinge faces squarely the inherent difficulties involved in teaching history in an elementary way at all: namely, the vastness and infinite variety of content, the danger of memorizing too much or too little, the problem of differentiating the home work of the pupil from the classroom work of the master, the lack of logical precision in either methods or results, and the practical difficulties of poor textbooks, ill-prepared teachers, the absence of proper school libraries and other facilities, and the abuse of examinations. By way of showing what can be done, however, even under these untoward conditions, Mr. Keatinge fills the larger part of his book with practical exercises, carefully worked out in detail, illustrating the use of sources and texts, the training of memory and judgment, and the technique of note-taking. We know of no book that does this sort of thing so thoroughly, or which opens to the ambitious teacher so large a possibility of making the study of history interesting. Yet to most teachers in this country these exercises, prepared for the use of English schoolboys of rather less than the average American high-school age, will seem, we frankly fear, quite impossible, which is another way of saying that history, in spite of all the zealous discussion of its pedagogical conditions, is still one of the most carelessly and indifferently taught subjects, and one of the least intellectual value in the secondary-school curriculum.

A revised edition of D. H. Montgomery's "Leading Facts of American History" (Ginn), with the narrative brought down to the beginning of President Taft's Administration, has just appeared. While the well-known characteristics of the book, including its somewhat fervid patriotism, have not been changed, a testing of the text at various points shows that the author has kept well abreast of recent literature in his field, and that the standard of accuracy is very high; while the references for reading have been thoroughly overhauled, and now include many of the best recent books. There is the usual apparatus of outlines, questions, and reference tables, a profusion of illustrations and maps, and a good index.

"A Syllabus of European History," by Profs. Herbert D. Foster and Sidney B. Fay of Dartmouth College (published by the college), has passed to a third edition. As compared with the first edition, the outline, covering the period from 375 to 1870, shows material improvement in the division and arrangement of topics and the more precise indication of work to be done by the student; while the typographical arrangement is clearer and more usable. The bibliogra-

phy is notable for its predominating reference to really serious books, instead of to a small list of handbooks and compends, and for its rigid exclusion of assignments of impossible length. Although the syllabus is not, of course, intended as a substitute for either text book, lectures, or notes, it should prove serviceable in any thorough college course in the general history of Western Europe.

A novel aid to the study of international law is "International Incidents for Discussion in Conversation Classes," by Prof. L. Oppenheim of the University of Cambridge (Cambridge: The University Press). Under twenty-five sections, but without particular attempt at topical classification, are presented one hundred typical international incidents, most of them of actual occurrence, but some hypothetical, intended to illustrate the leading principles of international law in their everyday application. In the hands of a skilful teacher, and with the aid of suitable text and case books, the collection ought to prove both useful and stimulating, though for American use the selection might well be supplemented by further incidents drawn from American experience. A feature of importance is the printing of the topics on the right-hand pages only, and on a writing paper. G. P. Putnam's Sons are the American publishers.

SCIENCE.

The "Text Book of Physics" (Blakiston & Co.), edited by Prof. A. W. Duff of Worcester, and written by him in collaboration with six other physicists, has proved its popularity by reaching a second edition in a year. The book has been carefully revised, and has, perhaps, been made a little more homogeneous. By dividing the text into coarse and fine print, provision has been made for a more elementary course than the complete book requires. On the whole, the subject is treated in a fairly adequate manner, surprisingly so when we consider the difficulty of such a plan of editorship. But the different sections do still show a decided variety in presentation, which detracts from the logical development of the science. For example, some of the collaborators treat their sections from the historical standpoint, while others ignore it. In mechanics and heat the large type portion of the text is frequently more advanced and difficult than the presumably less elementary part given in the small type in the subjects of light and electricity. In fact, the treatment of heat, and especially thermodynamics, is too advanced for the rest of the book, and the obscurities are increased by a rather cumbrous style. The discussion of sound seems inadequate for so extensive a book, and might be expanded to advantage. The authors have gone back to the method of separating mathematical equations from the body of the text, and clearness of exposition has been aided by this plan. The book is not a piece of hack-work, and shows careful search for new material and verification of old. The diagrams are poor, in many cases so small and badly drawn and printed as to be unintelligible. We note the following errors: Impigning for impinging (p. 340); diagrammatic for diamagnetic (505); the nomenclature for electrolysis should be credited to Whewell instead of to Faraday; the discovery of the effect of the phase on the appreciation of the direction of sounds has been credited by Lord Rayleigh to the earlier work of More and Fry.

In "Electricity" a text-book designed in particular for engineering students, by H. M. Hobart (Van Nostrand), the author has attempted to discard the crystallized pedagogical methods of the schools. To this end he has eliminated such outworn topics as friction machines, frog-legs, sealing-wax, electrophorous, the aurora borealis, which are usually, in his opinion, found dished up even in the most progressive of the recent text-books. His aim is to be more matter-of-fact. He begins his book with the statement that "electricity is a form of energy"; now, this may be a novel definition of electricity, but it is not matter-of-fact. We may not know what electricity is, but we do know it is not energy. And this typifies the work of writers who discard the cautious and conservative founding of engineering problems on the study of physics; where they are novel they are likely to be in error or superficial. The remainder of the text shows no special originality; most of the problems are worked out by the usual methods. The diagrams, tables, and problems form a useful set for the student.

Prof. J. A. Culler of Miami University has issued the first part, mechanics and heat, of a "Text-Book of General Physics" (Lippincott). This treatise is evidently designed for the college rather than for the university student, as it is better adapted to prepare the student for class recitations than for lectures. The subjects are treated clearly and concisely, and will give a good general knowledge of natural laws and phenomena. The diagrams and text are for the most part adequate. Some of them, however, are slovenly; for example, figs. 147 and 177; and fig. 151 is wrong. The definitions and laws of mechanics are clear enough, but Newton's fundamental laws of motion certainly deserve a more careful announcement than the off-hand statement: "These laws were written in Latin, and their interpretation is about as follows." The interpretation that follows is quite inadequate and partly wrong. The discussion of the luminiferous ether could easily be improved; in addition to its vagueness, it would be strengthened by a consideration of the more modern ideas. On the whole, however, the book has been carefully planned, and is a safe text for the student.

The text and hand-book on "Electric Power Conductors," by William A. Del Mar (Van Nostrand), is useful for those desiring knowledge on electric conductors, their materials, insulation, installation, and all work of this character. It is packed with data and formulæ, carefully chosen and skilfully presented. Diagrams and cuts are accurately drawn and printed, and great care has been taken to make the information readily accessible. Typographical errors are few: Kirchhoff's name, on page 38, should be correctly spelled, and the meaning of the symbol Z has been omitted on page 40.

That physical chemistry is coming to be a science of the laboratory as well as of the lecture room is shown by the appearance of new guides to its practical operations. One of the best of these is the "Physical Chemistry Theory and Practice" (Blakiston), by Prof. Arthur W. Ewell of Worcester Polytechnic. It lives up to its name in admirable manner, for each section contains a succinct development of the mathematical formulæ involved, the directions for an experiment, and a few problems and suggestive questions. Dr. Ewell takes pains to state just what apparatus is best and where it may be purchased, and his instructions are so carefully worded that we hardly need the assurance given in the preface that "the exercises described have been performed by the author's laboratory class for several years." The book is intended especially for the training of students in their third or fourth year of collegiate work, but it will also be handy for reference on methods to men engaged in researches involving the measurement of light, conductivity, vapor densities, reaction velocities, heat of combustion, dissociation, solubility, and the like.

Another work of very similar scope and purpose is Roth's "Exercises in Physical Chemistry" (Van Nostrand), translated by A. T. Cameron. This is about half the length of Professor Ewell's book and not quite so closely adapted to American conditions; otherwise it does not suffer by comparison, and is well worth translating. It is based upon the *Kleine Practikum* of physical chemistry which the author conducted for Nernst in Berlin before being called to Greifswald. The chapters on optical constants, thermo-chemistry, and molecular weight determinations are particularly thorough, and the volume closes, like the preceding, with a brief section on the measurement of radio-activity.

The "Manual of Physical Geography," by Dr. F. V. Emerson (Macmillan) is a laboratory guide. The subject is presented in the form of exercises and experiments, by means of which the student will gradually build up accurate physiographic conceptions. Starting with the form of the earth, the student is conducted through the topics of meteorology, earth sculpture, lakes, oceans, shore lines, and soils. Seventeen typical areas are then reviewed. The author is instructor in geology in the University of Missouri, and naturally treats his subject from the evolutionary standpoint.

After many years' experience in the teaching of geography in schools and normal colleges, W. J. Sutherland has prepared a work, "The Teaching of Geography" (Scott, Foresman & Co.), which is a strong appeal for improved instruction in this important subject. In carrying out his plan, he has passed in review the relations of geography to other sciences, and to the many activities of human life. Besides these points the reader receives much valuable advice in the matter of presentation, equipment, and works of reference.

The "Advanced Physiology and Hygiene" of H. W. Conn and R. A. Budington (Silver, Burdett) is the third in Conn's graded series of physiologies, and is apparently intended for use in high schools. The authors have endeavored to reduce the load of anatomical details commonly carried by such books, and in this are measurably successful. Hygiene is treated briefly and rather didactically, but the general directions for the preservation of health are good and might be made impressive. In purely physiological matter the book is very uneven. Many of the facts are so well presented that the defects are the more regrettable; the most inexcusable is perhaps the statement that the cranial

nerves are ten in number. The directions for demonstrations are hardly adequate except for a skilled teacher well able to make extensive modifications.

Literature.

MALTA.

A History of Malta, During the Period of the French and British Occupations, 1798-1815. By William Hardman. Edited with Introduction and Notes by J. Holland Rose. New York: Longmans, Green & Co. $6.50 net.

Mr. Hardman, who for fifty years made Malta his second home, brought together from the archives of Malta, Naples, Paris, and London a valuable collection of documents referring to events in the history of the island from 1792 to 1815. He wished to gather material which would enable students of history to form a correct appreciation of Great Britain's actions toward Malta during these years. He had woven the documents together with a good connecting narrative, but death overtook him before the manuscript was quite ready for the press. His executors gave his material into the hands of perhaps the ablest English interpreter of Napoleonic statesmanship, J. H. Rose. This was fortunate. For Mr. Rose has added many explanatory notes and written an admirable introduction, and thus made clearer some of the larger questions of the period.

If this volume were merely the history of a little island of a hundred square miles, with a population of only a hundred thousand souls, during a score of ordinary years, we should not deem it worth an extended review. But it so happened that Malta was a most important pawn in the greatest game of war the world has ever seen. Like Copenhagen, Gibraltar, Egypt, and Panama, it came to be regarded as one of those vantage-points of world-empire importance, whose fate it is to be bandied about in strifes in which they have no prime concern. A whole year before the Egyptian Expedition actually set sail, the keen eye of Bonaparte had seen and considered the strategic importance of Malta. With his usual foresight he sent a secret agent, named Poussielgue, to establish relations with disaffected persons there, and to report on possible means of seizing the fortress of Valetta. Poussielgue's interesting report, here reproduced, like many of the other documents in the original French, reached Paris early in 1798, and was considered by Bonaparte and the Directors a few days before they decided to abandon the expedition against England in favor of one against Egypt. Bonaparte's intention to seize Malta on the way to Egypt must have been confirmed by Poussielgue's report and his statement that "celui qui possède Malte est le maître absolu du commerce de la Méditerranée. C'est un autre Gibraltar." The truth of this has been made evident enough by the events of the nineteenth century, but the English had not appreciated it until the French made it clear. Even Nelson at first thought "the possession of Malta by England would be a useless and enormous expense" (April 6, 1799); but after maturer consideration he later correctly pronounced Malta to be "a most important outwork to India" (June 28, 1803). So the fate of Malta depended, not on the Maltese, not on the Knights of St. John, but on the mighty forces that were set in motion by the will of Bonaparte, and were ultimately thwarted by England's sea power.

Yet the history of the Order of Knights and of the Maltese population is also not without an interest of its own. The island had been given to the Order by Charles V in 1530, to protect Europe against the Mohammedan advance. A statement of the revenues of the Order just before the French Revolution, drawn up by Bosredon Ransijat, the treasurer, shows tolerably well the cosmopolitan character of the Order and the relative influence in it enjoyed by each of the European countries. In 1788 France contributed 1,392,974 livres, Spain 651,492, Italy 564,802, Portugal 220,503, Germany 103,396, and Poland 15,880. From these sums, together with a small revenue extracted from Malta itself, the Knights had lived in comfort. But their finances became hopeless after 1792, when all their possessions in France were confiscated, and the outbreak of European wars entailed further losses. Incredible as it may seem, their income shrunk from £136,417 in 1788 to £34,663 in 1798. For this reason alone the collapse of the Order was merely a question of time. The Knights were further weakened by their own degeneracy; when the Mohammedans were no longer a menace, their *raison d'être* was gone. Yet they continued to exist as an arrogant oppressive aristocracy, who stirred discontent and hatred in the hearts of the Maltese people. The Maltese were never allowed to become Knights. They could not walk on certain promenades; they could never sit in the first dozen rows at the theatre, even if the seats were vacant. They had no share in the government. At the same time every Knight insisted on having some Maltese wife or daughter as his mistress; husbands and fathers dared not object. Coleridge the poet, who was private secretary to the first English Governor of Malta, summed up the state of affairs by saying that "the Knights were little better than a perpetual influenza, relaxing and diseasing the hearts of all the families within their sphere of influence."

On June 12, 1798, when the Egyptian Expedition anchored off Malta, the Knights were compelled to surrender in quick order. Mr. Hardman shows that this was not due altogether to the pusillanimous behavior of the grand master and the cowardice of the Knights. It was due in good part to traitors within the Order with whom Bonaparte had been in communication, and also to the fact that the Maltese population hailed the French as liberators. The islanders thought they would prefer the rule of the French to that of the Knights. They were soon disillusioned. They found themselves pestered by a host of fussy officials who were determined to force upon them the blessings of the French Revolution. They were ordered to wear tri-color cockades. They were heavily taxed and their churches were plundered to help pay the costs of the Egyptian Expedition. Their joy in June turned to anger in August, as they began to realize that their last state was worse than their first. The Arabic strain in their blood and their remoteness from the main current of European thought made them subject to superstition and fanaticism. It needed only a spark to set them aflame. They were encouraged by the news of the total defeat of the French fleet by Nelson at Aboukir. On September 2 the confiscation and sale of some monastic property led to a riot, and the riot grew into a revolt. Just eighty-two days after their arrival these same French were murdered in the open country or driven into the fortress at Valetta. Here, for two years, they sustained a gallant siege under Vaubois, whose detailed diary is published in an appendix. The Maltese shut the French in on the land side, and the English blockaded the port. Within the fortress rats were soon worth 40 sous apiece. On September 5, 1800, the French surrendered the fortress and the island into the hands of the English, who have retained it ever since.

At the peace of Amiens England promised to restore Malta to the Order of St. John within three months under certain conditions, one of which was that Russia should agree to the terms of the peace. But before this the exiled Knights had sought refuge in Russia and flattered the fancy of the crazy Paul I by making him grand master. If he had not "died of apoplexy," to use a Russian euphemism, it is altogether probable that the English would have handed over Malta to Russia after the peace of Amiens. The Maltese were in despair at the prospect of the restoration of the Order, and sent deputations to England to prevent such a disaster. But the English could do nothing for them except insert in the treaty a clause which made it possible in the future for Maltese to become Knights and have a share in the government of the Order. Russia steadily refused to accept this clause, as well as other parts of the

treaty. The three months passed by, and it became clear to the English that Bonaparte did not intend to respect the treaty; so the English did not keep their part of the agreement to restore Malta to the Knights. Malta thus became one of the chief occasions for the renewal of the great war. Mr. Hardman's documents allow the student to follow and understand all the intricacies of these negotiations of which Malta was the centre.

Maltese histories in the past and Maltese politicians to-day are inclined to assert that the Maltese were the principals and the English only auxiliaries in the expulsion of the French, and to complain that the English deprived them of their right of self-government. Mr. Hardman shows conclusively the absurdity of both of these points. Except for Nelson's victory at Aboukir and his blockade of Valetta, the French would have received provisions which would have enabled them to hold out any length of time against the handful of Maltese on the land-side. Nor did the English deprive the Maltese of self-government, since the Maltese had never enjoyed it. The *Consiglio Popolare* was never in any sense a representative or a legislative assembly. Statistical tables in an appendix leave no doubt as to the material prosperity of Malta under British rule.

CURRENT FICTION.

The Thief of Virtue. By Eden Phillpotts. New York: John Lane Co.

In "The Haven," Mr. Phillpotts departed, though by a hair's-breadth, from his familiar field of the Devon moor-country. His fisher-people were not very different humanly from his people of the tors; but something of atmosphere was lacking; one missed the pictorial quality, which gives a characteristic charm to the moor tales. "The Thief of Virtue" is upon much the same plane as "The Three Brothers"—built upon a tragic motive, and yet less sombre than certain of the earlier stories—for example, "The Whirlwind." Retribution is the familiar theme, but it is a retribution altogether clear from the punishment of man by man. Philip Ouldsbroom is a sort of rustic Lear, a big nature and a little brain, who comes to ruin through excess of the qualities which make him admirable and lovable. In the full of his youthful pride and strength, he steals away the promised wife of a poorer and less assertive man. She herself is by no means a weak woman, and she loves the weaker man; but there are ruthless elements in her composition. She covets what Philip can give her, and admires the force of his character. He really loves her with all his strength, but marriage means children first of all to both of them. He is one of the rare men in whom paternity is a veritable passion. But the years pass, and they have no children. Then comes the turn of the injured lover. His vengeance upon Philip takes the form of a son whom Philip brings up as his own. The supreme irony of the subsequent action lies in the fact that never to the very last does Philip suspect that his wife has been unfaithful to him, or that Martin is not his son. Retribution takes the subtler form of the development in the son of his real father's narrow and ungenerous nature, and in the disappointment of all the supposed father's hopes. Philip Ouldsbroom becomes a drunkard, but dies of a broken heart. Martin, ignorant of his real parentage (since nobody but his real parents have ever known the fact), grows up the perfect opposite of the man whose name he bears. As always with Mr. Philipotts, the mood of the tale is stern, without bitterness. A kindlier light shines upon his Devon than upon Mr. Hardy's Wessex.

The Green Mouse. By Robert W. Chambers. New York: D. Appleton & Co.

We realize that the theme of the maiden in distress, with the opportune arrival of the knight-errant, is a perfectly legitimate one for the story-teller to choose. It may date back to the palæozoic era, but its possibilities are eternal, provided it is treated in the proper fashion. Whatever that fashion may be, it is not the one employed by Mr. Chambers in the present volume. His first episode, which presents this theme in its entirety, is a masterpiece of banality. The stage machinery groans with the piteous ills of old age. Dust lies thick on every page, in spite of the breezes of a rapid-fire style. We almost shrink from outlining it: The tall, clean-cut, young man, once rich, now poor, ever well-bred and fashionable; the beautiful young woman, also well-bred and fashionable, with bluish-violet eyes, and many millions of dollars; her runaway horse in the park; the gallant rescue; the ensuing *entente*—financial, as well as matrimonial. Farther into the details we dare not go. Yet Mr. Chambers is so charmed with his little idyl of the idle, as he cleverly calls it, that he proceeds to repeat it, not once but six times. It seems incredible, but between the cryptic dedicatory poem and the publisher's notices seven unusually beautiful young women fall on seven unusually manly breasts, after listening to seven sets of phrases expressing love and eternal devotion. Seven times we learn that "radiant, yet sweetly shamed, confident yet fearful, she lifted her adorable head from his shoulder." The details vary a little; in one case, instead of a runaway horse we have a runaway elevator, again a runaway cat, and so forth; but the result in each case is identical.

The connection between this series of sentimental episodes is obligingly supplied by the hero of the first. He invents a wireless apparatus for bringing affinities together by means of their particular individual psychic waves. So the love affairs are machine-made in more senses than one. A company is formed to exploit the invention, and the book then describes the numerous instances in which its operations are successful. A green mouse—he was white once, but somebody dyed him—happens along and is made to furnish the title. Having accomplished his task, he is heard of no more. Financial backing for the Green Mouse, Limited, is furnished by the heroine's father, an explosive old gentleman addressed by his daughters as Pa-*pah*. He wears a monocle and from time to time, we are told, he emits a mellow bellow. Comment upon him we do not feel able to make.

The Fir and the Palm. By Olive Briggs. New York: Charles Scribner's Sons.

The Fir is a New York surgeon, grave, preoccupied, wonderfully skilful with his professional hands, indifferent to women apart from the operating table. He is a true woman's hero, stern, silent, abrupt, a worshipful person in the eyes of his creatrix. The boys in the clinic, the nurses in the hospital, all adore him:

> "Bi-chloride!"
> They flew.
> "Sterile gauze!"
> "Here, Doctor."
> "Rubber plaster! . . . A probe!"
> They were there by his side. . . .
> "The thermometer. . . . See what it registers."
> Instantly it was placed and recorded.

Not even the thermometer dares delay. No wonder the Palm is unable to resist him. The Palm is a little Italian dancer, daughter of a famous lion-tamer who has finally lost her life in the arena. The daughter plans to take her mother's place among the lions, but the surgeon will not have it. The girl has been virtually committed to his care by the dying mother, and, besides, he loves her madly. How he marries her, how and why she escapes him, how he pursues her for a long time in vain, how he at last finds her and they are reunited, forms the substance of a narrative in which the author herself takes an intense interest.

The Fulfillment. By Alice P. Raphael. New York: Sturgis & Walton Co.

In some ways, this novel seems a little old-fashioned. The New Woman, sacrificing things domestic to a Career and Self-development—how frequent and familiar she was, some fifteen or twenty years ago! The radicals have pretty well thrown her over by this time; for them "the individual withers and the world is more and more." The reader soon finds, however, that the author

is not so sympathetic with her individualistic heroine as her minute description of Vera's exotic beauty had led him to expect—in fact that she is bent on using the poor girl to point a relentless moral. And here is where the book is really and rather refreshingly old-fashioned: the author actually has a point of view, a definite theory of life and morals. Therefore, apart from the merits of her particular theory and despite the frequent obviousness, sententiousness, and even banality of her reflections, her work stands distinctly, in unity, emphasis, and clear organization, above that of more modern novelists whose æsthetic as well as their moral creed seems to be that everything and everybody is as good as everything and everybody else.

Gwenda. By Mabel Barnes-Grundy. New York: The Baker & Taylor Co.

Reflecting on the innocently primitive character-drawing and the amiably slipshod style of this harmless work, one wonders how it ever got into print. The secret lies, one comes to suspect, in the supposedly realistic, certainly minute, vivid, and unpleasant account of a case of appendicitis, operation included, which as a crisis, and a substitute for the usual first baby, in the heroine's life, constitutes the novel's only claim to originality. Probably the countless numbers of the appendixless will enjoy comparing experiences with Gwenda, and make for the book a profitable audience.

GERMAN NATURALISM.

Die neue Form: Ein Beitrag zum Verständnis des deutschen Naturalismus. Von O. E. Lessing. Dresden: Carl Reissner.

To orthodox believers in old-fashioned literary standards and ideals, the author of this book offers a number of simple formulas (besides much learned but rather irrelevant matter), which will solve all their doubts as to the importance of the new phenomenon known as German naturalism: "Artists and learned art critics rarely understand each other"; "The creative instinct and the conventional æstheticism of the mere observer often conflict within the same individual"; "Lessing follows much too faithfully his infallible Aristotle"; "Goethe and Schiller struggle painfully and not always successfully against the subtle influence (Suggestion) of Winckelmann and Kant"; "If the subject matters nothing and the form is everything [the author is led to the deduction by a remark of Schiller's in the "Briefe über die ästhetische Erziehung"], then the question as to what are legitimate motives is solved. Then the artist has the whole world at his disposal, anything and everything, whether 'beautiful' or 'ugly,' gruesome or attractive, sublime or lovely"; "Then whatever is real is true, in so far as it becomes æsthetically alive; then everything in which the form has conquered the subject is beautiful; then beauty is inherent and not transcendental; then beautiful is synonymous with artistic." To all of which skeptical followers of the old school will be tempted to reply, in the language of the *Fliegende Blätter:* "Nicht Alles was hässlich ist, ist schön—not everything that is ugly is beautiful."

Not thus is daunted Prof. O. E. Lessing. He holds up to our unbounded admiration every line of the writer to whom he devotes the bulk of his book, Herr Arno Holz, the ripest exponent of German naturalism. In him, we have the "new form" in its highest perfection. Take these simple lines, an imperfect, though literal, translation of which we venture to add:

Draussen die Düne.	Out there the dune.
Einsam das Haus, eintönig, ans Fenster, der Regen.	Lonely the house, monotonous, 'gainst the window, the rain.
Hinter mir, tictac, eine Uhr, meine Stirn gegen die Scheibe.	Behind me, tick-tack, a clock, my forehead 'gainst the pane.
Nichts.	Nothing.
Alles vorbei. Grau der Himmel, grau die See, und grau das Herz.	Vanished the whole. Gray the heavens, gray the sea, and gray the heart.

Mr. Lessing's critical comment on this gem is as follows: "Expression, in its greatest simplicity, has here reached the highest degree of vividness, and, wonderful as it may seem, the rhythm no longer halts: it obtrudes neither by roughness nor smoothness; it is as such not noticeable at all. Contents and form are absolutely at one. There are few lyrics in German literature which accomplish so much with such simple means." Still, just as the artless simplicity of Heine's most exquisite songs was the result of incessant filing and polishing, so is the witchery of Arno Holz's rhythm often the crowning triumph of various changes in topography, including punctuation, leads, indenting of lines, and marking of "explanatory stops" (*Sinnpausen*), which make a world of difference to the initiated. Take, for instance, this stanza of four simple words, as first arranged, and as finally given to the world by Herr Arno Holz:

Vergeben?
Ich?
Dir?
Längst!

This form "werges on the poetical" (to speak with the elder Mr. Weller), but

Vergeben? Ich? Dir?
Längst.

is decidedly "more tenderer." As Mr. Lessing explains, "the dual oneness of the I and Thou, disturbed by the guilt of the one, becomes more pronounced by the juxtaposition," etc., etc. And "what power of description, what magic insight, what splendor of coloring live in the Oriental phantasies of the modernist" who could pen lines like the following, descriptive of a Japanese dragon?—

Mit der Nase
stürzt er in den Baikalsee,
sein linker Hinterzeh zerquetscht den
Dhawalagiri.
(Nose foremost
he drops into Lake Baikal,
his left hind toe crushes Dhawalaghiri.)

So much for the new form in lyric poetry. Of the dramatist Arno Holz we speak with more hesitation. Mr. Lessing devotes fifty pages to an analysis of "Sonnenfinsternis," a tragedy which, as its subject is unspeakably revolting to our uncultivated taste, we are bound to confess we shall not read, even after being assured that "at last Germany possesses a tragedy which did not spring from Greek, Roman, English, French, or Scandinavian soil, but is entirely German in its essence and form." We prefer to be classed with the public which "has no eyes" and "revels in the hollow rhetoric of a lying classicism" or "staggers once more in the fog of transcendental romanticism." Mr. Lessing would probably refer those who pass over in silence (because of its subject) the "profoundest tragedy of modern times," to the "Œdipus Tyrannus." Indeed, there is a slightly sneering allusion to the "miraculously accidental primal guilt" of the "Œdipus," which evidently means to imply that if the world has so long been able to stomach the unconscious guilt of Sophocles's tragedy, it ought to swallow without a murmur the tangible horror of the German modernist.

It is, indeed, a nauseous mess which the learned elucidator of Arno Holz places before us. Let us ask him, in all candor, whether he thinks it advisable in an American teacher (Mr. Lessing is professor in the University of Illinois) to set up literary standards which are in contravention of what the entire civilized world has cherished for thousands of years? Thirty years ago the great Hellenic scholar, Professor Gildersleeve, spoke in the *Nation,* after a performance of "Œdipus" at Harvard, of "the permanency of the ancient classics as an integral part of our civilization." Would Professor Lessing advocate the production of "Sonnenfinsternis," that "tragedy raised to the highest power" (*Tragödie in der Potenz*) by American college students?

Across Papua: Being an Account of a Voyage Round, and a March Across, the Territory of Papua, with the Royal Commission. By Col. Kenneth Mackay, C.B., M.L.C. With 40 plates from photographs, and a folding map.

New York: Chas. Scribner's Sons. $2.50 net.

This is the entertaining account by Col. Kenneth Mackay, C.B., of a visit to British New Guinea as chairman of the Royal Commission, sent out to report upon the present conditions of the territory and the best means for their improvement. To get the necessary information they sailed round the entire coast-line, visited all the principal settlements, and crossed the island from north to south over the almost impassable Owen Stanley Range. His impressions, scribbled down, to use his own words, after the day's work was done, are of enchantingly beautiful scenery and a land of extraordinary fertility. In a station garden he saw growing twenty-one different fruits and vegetables, and counted fifteen dozen bananas in one bunch, while from the produce of twenty acres nearly fifty persons had been sustained for a year. A prosperous future undoubtedly awaits Papua, from its special adaptation to the cultivation of coffee, copra, and rubber. The greatest interest was awakened by the study of the natives, who consist of "many tribes, often distinct in physical type, language, occupation, customs, dress, weapons, and character." The mountaineers are of fine physique and are generally a moral and dignified people. Cannibalism, however, still seems to survive even among the tribes brought closest into contact with the whites. As an illustration of the intelligence of the children, he quotes a missionary who told him that "he was constantly being critically questioned by his pupils after telling some of the Bible stories. For instance, having given his class an account of how Noah took two of each type of bird, animal, and insect into the ark, and so preserved the various species, a boy next day came to him and asked, 'Did Noah take two of each sort?' 'Yes,' replied Riley. 'Two fowls?' 'Yes.' 'Two pythons?' 'Yes.' 'No fear,' said the boy. 'But why?' 'Why,' laughed the boy, 'because if Noah had put two pythons in the same ark as those fowls, there wouldn't be any fowls now.'"

In regard to the vexed question of colonization Col. Mackay's judgment is that "in this fruitful region there is room enough for white and brown alike to work out and mutually improve each other's destinies, if only the more highly developed race will realize that morality, industry, honesty, firmness, and patience are virtues that to be rightly claimed must be consistently practised in every-day intercourse with a people who can respect these attributes, and will eventually respond to them, and in certain instances possibly absorb them into their own lives." In a book written as this was there are, of course, many rather trivial things told, and most readers will regret some occasional attempts at humor and the too frequent use of sacred words. But these are minor blemishes in a work which gives much useful information about a little-known country and people, and in which there is special mention and hearty commendation of the valuable work of the missionaries. Many of the forty reproductions of photographs are exceedingly attractive, and an excellent map enables one easily to trace the route of the commission.

Personal Power: Counsels to College Men. By William Jewett Tucker. Boston: Houghton Mifflin Co. $1.50 net.

As President of Dartmouth College, Dr. Tucker exerted great influence upon his students in the direction of clean, wholesome, and effective life. His success as an administrator and builder was not less than his power as a moulder of student opinion. He found his college in a questionable position among New England institutions of the second rank, and he left it challenging the very first in respect to the importance and quality of its strictly college work. He came to Dartmouth, also, when general opinion did not credit the institution with the most helpful moral tone, but it was not long before Rollins Chapel was celebrated as one of the most powerful influences toward good morals among young men to be found east of the Hudson river. The present volume reveals his method and the secret of his power. It contains about twenty of his sermons and addresses at the opening of the academic year. The thought is vigorous and clear, if not profound, and the style is direct and simple. There is no eloquence, no pleading, none of the rhetorician's "action," but neither is there cant or commonplace. A visitor at Rollins Chapel once overheard a student's comment at the close of one of Dr. Tucker's services, "Wasn't that the slickest thing you ever heard?" Without disparagement, it may be said that the student's slang adjective was well chosen. President Tucker was always tactful, and there is a cleverness of approach and treatment in each of his discourses which one who bears in mind his audience and his purpose must greatly admire.

The morality of a tactful and successful college administrator is in constant danger. To lift student sentiment always a little higher, while realizing that perfection is impossible, to maintain the personal hold needful to impart carrying quality to one's words, is to be tempted constantly to do evil that good may come. One may ask, if Dr. Tucker has not yielded to this allurement in his admission that "the prevailing type of mind in the colleges is set toward affairs," and in his contentment in the fact that the scholar is no longer the exclusive or chief product of American academic life. The growing proportion of students who are devoid of the interests and ambitions of real scholarship finds no strong protest in his pages, but rather contented recognition. The reports which used to issue annually from Cambridge sounded a worthier note. Exaggeration of athletics has found little discouragement in Dartmouth utterances, if one may judge from this volume. The discourses are uplifting and instructive in a hundred directions in which American students need guidance, but in the two respects in which college men most need challenge, the loss of scholarly devotion and the over-emphasis upon athletics, they would have been better for a more resolute iconoclasm.

Notes.

Yale University Press will soon publish a work of peculiar timeliness, entitled "The High Court of Parliament and its Supremacy. An Historical Essay on the Boundaries between Legislation and Adjudication in England," by C. H. McIlwain, who is a member of the Department of History, Politics, and Economics at Princeton University.

We welcome the announcement of a new series of books, Harvard Studies in Comparative Literature, to be published under the general editorship of Prof. W. H. Schofield. It will comprise works by Harvard graduates or instructors. The volumes are to be handsomely printed at the Merrymount Press, and can be got separately, or by subscription at a discount of 10 per cent., from the Publication Agent of Harvard University. The first volume, now in press, is "Three Philosophical Poets—Lucretius, Dante, and Goethe," by Prof. George Santayana. Other works, in preparation, are as follows: "Poetic Values in Anglo-Saxon Verse—a Comparative Study," by Prof. Francis Burton Gummere; "Boethius," by Prof. Edward Kennard Rand; "The Old Norse Journeys to America," by Prof. Merritt Lyndon Fernald; "French Influences on Chaucer," by Prof. John Livingston Lowes; "The History of Allegory in Spain," by Dr. Chandler Rathfon Post; "The Literary Relations of England and Scandinavia from the Norman Conquest to 1300," by Dr. Henry Gordon Leach; "The Comedies of Ludwig Holberg," by Oscar James Campbell.

The John Lane Company announces the following forthcoming publications: "The Foundations of the Nineteenth Century," by Houston S. Chamberlain; "Robert Dodsley: Poet, Publisher, and Playwright," by Ralph Straus; "Memories of Sixty Years," by Oscar Browning; "John Lothrop Motley and His Family:" further letters and records edited by His Daughter and Herbert St. John Mildmay; "Simon Bolivar, 'El Libertador,'" by F. Loraine Petre; "Lady Charlotte Schreiber's Journals," edited by Montague Guest, with annotations by Egan Mew; "Self-Love: the Book of Pleasure"; "Indian Birds," by Douglas Dewar; "The Starlit Mire," by James Bertram and Russell Wilkinson; "Insect Wonderland," by Constance M. Foot; "What Pictures to See

in Europe in One Summer," by L. L. M. Bryant; "Simon the Jester," by William J. Locke; "The Wicker-Work Woman," "The Elm Tree on the Mall," "The Opinions of Jerome Coignard," "The Aspirations of Jean Servien," and "At the Sign of the Reine Pédauque," by Anatole France; "Alongshore," by Stephen Reynolds; "The Way Up," by M. P. Willcox; "Tropical Tales," by Dolf Wyllarde; "The Saint's Progress," translated from the Italian of Ciro Alvi by Mary Gibson; "The Cradle of a Poet," by Elizabeth Godfrey; "Half in Earnest," by Muriel Hine, and "My Brother the King: The Tale of James Darcy (King James I of Yalmal) and His Sister, Wyemarke Darcy," by Edward H. Cooper.

Herbert Putnam, librarian of Congress, desires us to make known the fact that the "Report on the Star-Spangled Banner, Hail Columbia, America, Yankee Doodle," by O. G. T. Sonneck, chief of the division of music, which has been offered for sale by certain private concerns for $1.25, can be obtained of the superintendent of documents, Government Printing Office, Washington, at 85 cents a copy.

Gen. James Grant Wilson's entertaining volumes on "Thackeray in the United States," were originally issued in 1904, at the price of $12.50. By omitting the bibliography of 174 pages the two volumes are now published as one, by Dodd, Mead & Co., at the more comfortable price of $3.50. The old wealth of illustrations has been retained, and indeed six Thackeray drawings have been added. The book is a mine of interesting and characteristic anecdotes.

In the "Waverley Synopses," published by Thomas Y. Crowell & Co., J. Walker McSpadden has arranged Scott's novels chronologically, and under each title has given an alphabetical cast of the characters and a summary of the plot. A general index at the end makes the book more useful for speedy reference.

Percival Chubb has planned three small volumes of selections from Mark Twain, presenting that author less as a humorist than as an historian and autobiographer. Of these volumes the first, "Travels at Home," has just been issued by the Harpers. It is made up chiefly of experiences on the Mississippi and in the mining fields. Especially adapted for the higher classes of elementary schools, it will serve as a travelling companion for older readers. The energetic literary quality which is completely merged in the mazes of the complete books is here in a sense isolated and more palpable. The frontispiece is an excellent recent portrait of Mark Twain in the familiar white flannels.

It is sixteen years since Sarah M. H. Gardner's demurely charming book "Quaker Idyls" (Holt) saw the light. It is now reprinted, with the addition of two sketches. With singular delicacy and humor this author reveals the heroic tragedy of the Friends in contact with great causes, and the comedy of their contact with the sly and insistent world. The workmanship is always delightful, and the book simply must be read. There could be no pleasanter escape from the problem novels—though problems are here and are not evaded—and from the prevailing overemphasis.

"The Pageant of English Poetry" comes to us from the Oxford University Press in two forms, one being printed on India paper. It is an anthology of 1,150 poems and extracts by 300 authors, the arrangement being alphabetical by authors. It is an interesting treasury of song, the more interesting probably because it permits the liberty, unusual in anthologies, of printing parts of poems. Sometimes this liberty is, in our judgment, abused, as when, for instance, only two stanzas of Praed's "The Vicar," certainly the best thing Praed ever did, are given, although six pages are accorded him. The book is also out of the usual line of English anthologies in including American authors. For this we may be grateful, although it seems strange to find among the selections from Longfellow "The Slave's Dream" and "Excelsior," but not one of his noble sonnets. From the same house we have "The English Parnassus, an Anthology of Longer Poems," with introduction and notes by W. Macneile Dixon and H. J. C. Grierson. Works of such length are included as "The Knight's Tale," the third and fourth cantos of "Childe Harold" (though nothing from "Don Juan, perhaps *pudoris causa*), "In Memoriam," "Sohrab and Rustum," and the "Rubáiyát." The book is admirably adapted for use in college reading and in the higher school grades. With these anthologies may be mentioned "Eighteenth Century Literature: An Oxford Miscellany," which contains a number of rather slight papers by various writers on such topics as Steele and the Sentimental Comedy, Lady Winchelsea, Fielding's Jonathan Wild, Horace Walpole's Views on Literature, and Enthusiasm. The book affords pleasant reading.

The *National Geographic Magazine* for March contains an instructive account of the compass in navigation and the work of the non-magnetic yacht Carnegie, by its director, L. A. Bauer of the Carnegie Institution. To give the mariner correct information is the main purpose of the yacht's work in the recently finished cruise of 8,000 miles, and in the next to circumnavigate the globe. As the result, it is hoped that in five years the institution will be able to issue magnetic charts for nearly the whole earth, based for the first time upon uniformly and systematically acquired data. An earnest appeal for the proposed Glacier National Park in northern Montana is made by G. E. Mitchell of the Geological Survey. In addition to displaying wonderfully beautiful mountain scenery, the park is inhabited by wild animals and birds, and the streams and lakes abound in many kinds of fish. The project meets with favor in Canada and a railway to reach it may form a connecting link between the Canadian Pacific and Northern Railroads, to the great advantage of the farming region through which it would pass.

A comparison of the statistical data in the last edition of "Minerva" (1909-10), with the figures contained in the edition of fifteen years ago (1894-5), which we happen to have before us, shows a remarkable growth of the Slavic universities. In this short space of time Moscow has advanced from sixth to third place among the universities of the world, being inferior only to Paris and Berlin with respect to the number of students, while St. Petersburg, which was seventeenth in order, comes now next to Moscow. The two institutions have between them upward of 17,000 students, a figure which appears the more striking when we consider that it is about equal to the aggregate attendance at the score of German universities not longer ago than the Franco-Prussian war. Kharkov has quadrupled, having now above 4,000 students—as many as Harvard; Odessa, which had an attendance of only about 500 in 1895, has more than sextupled; and Kazan has increased from 800 to 2,900. The limitation of the number of Jewish students will account for the relatively slow growth of the university of Kiev, which is centrally located with respect to the Jewish population of Russia proper. The famous university of Dorpat, in Livonia, which has recently been Slavicized (the Russian language having supplanted the German in all the faculties except that of theology), has increased about 80 per cent. Muscovite repression in the former kingdom of Poland is manifested by the decline of the attendance at the University of Warsaw from 1,200 to 800. On the other hand, the vigorous and untrammelled assertion of Polish nationality in the composite realm of the Hapsburgs is evinced by the growth of the two Galician universities, those of Lemberg and Cracow, whose attendance has quadrupled and doubled respectively in these fifteen years. The Czech University of Prague, the focus of the intellectual activity of the Slavs of Bohemia and Moravia, established not quite three decades ago by the side of the oldest university within the bounds of the Germany of the Holy Roman Emperors, now boasts about 4,000 students, the increase since 1895 having been about 50 per cent. The Southern Slavs have, in their modest way, kept pace with their consonant-tongued brethren in the North. The university of Sophia, which, in 1895, had only 300 students, has now about 1,500, and the progressive spirit of new Bulgaria, only recently emancipated from its five centuries of thraldom under the Moslems, is revealed by the circumstance that above 200 of the students are women. The attendance at the Servian and Croatian universities (Belgrade and Agram) has increased 100 per cent. Russia has one important university which cannot be reckoned among Slavic institutions of learning, that of Helsingfors, in Finland, whose teaching body still consists of Swedes and Finns.

The Beguiling of Juries might fairly serve as the sub-title of Francis L. Wellman's "Day in Court" (Macmillan). The author describes with clearness, humor, and apt illustration, the arts by which juries are propitiated, witnesses confirmed or undermined, in short, the whole delicate conduct of a jury trial. Interesting as the book is it will leave the layman a little at a loss to see how substantial justice can result from such a process. Mr. Wellman, as a veteran pleader, naturally takes the severely professional view of the matter. For him a trial is mostly a contest of wits between opposing counsel, with the victory likely to turn to him who adds to wit moderation and tact. His examples of the right and wrong ways of introducing witnesses under direct examination are most instructive. It is in direct examination, not in the brilliant feats of cross-examination, he feels, that cases are won and lost. On every point of courtroom human nature he is illuminat-

ing. Lawyers will naturally enjoy a book that magnifies their profession and sets it in a positively æsthetic light; young lawyers will find many practical hints in it. On the whole, however, the enlightening effect of this confessional volume will be greatest in the case of laymen. We know of few books that reveal so completely what one might call the legitimate histrionism of pleading—the delicate adjustment of demonstration to the capacities and prejudices of the twelve plain men in the box. Mr. Wellman's subject is the lawyer, but we wish he had approached the fundamental mystery how a jury verdict obtained under skilful manipulation by counsel will usually result in substantial justice. His conception of pleading is, though finer, not very far removed from the Greek and Roman precedents. The opportune exhibition of Phryne's bosom, or of the tears of the next of kin, would, unless we misread him, fully meet his approval. The paradox of essential justice surviving the wiles of the master advocate was worth elucidation. No one could attack the enigma more hopefully than Mr. Wellman. Possibly juries have a kind of transcendental sixth sense, which blindly makes for righteousness. Mr. Wellman's anecdote of that jury which, pestered by lying witnesses on both sides, agreed to ignore both the law and the evidence, and "find on the merits of the case," is suggestive. Again, the more familiar tale of the jury that, in spite of Rufus Choate's evidence, had to find for his client, being reluctantly constrained thereto by the law and the facts, may profitably be analyzed by lawyers of the ornate tradition. Among minor slips we may note an allusion on page 148 to a Tilden-Beecher trial, and the perverted form of a Ciceronian quotation on page 247. An excellent and most entertaining book.

Charles Ffoulkes's "Armor and Weapons" (Frowde) is a concise description of what the ordinary man wore, how he wore it, and how it was made in the days of chivalry and of the tournament. Originally the facts were given out in lecture form before the University of Oxford during the Lent term, 1909; they are here illustrated and magnified into a handbook for use in studying history and as a short guide to the somewhat intricate technicalities of the craft of the armorer. As an aid in following out the evolution of civilization and as an explanation of ancient modes of warfare with which the advance of civilization has been indissolubly connected, these studies hold something more than mere sentimental interest. Roughly speaking, the period of armorial defence extends from the Norman Conquest to about 1660, and may be divided into the age of mail (1066-1277); the transition period (1277-1410); and the era of plate armor (1410-1660). With our modern notions of defence, in which lightness and speed are the chief requisites, it is little short of ridiculous to read that the accoutrements of a cavalryman were sometimes so heavy that he could not mount his horse without assistance, and that in long marches he was often tempted to throw away his expensive outfit in order to conserve the strength of himself and his beast for the actual encounter with the enemy. This fact was especially in evidence during the period of plate armor, when the cavalry horse was covered from ears to tail with the most elaborate and costly steel which the craftsman could invent. By the middle of the sixteenth century, the influence of the Renaissance brought about an arabesque strangeness and grotesqueness which marked the beginning decadence of the *homme de fer*. With an attempt at ornateness the practical utility of armor began to decline, though it was still commonly worn in pageant, joust, and parade well on into the seventeenth century. Leg armor was the first to go, the jambs being replaced by buff leather boots, a distinct forerunner of modern cavalry leggings. The epoch most advantageous for the study of armor in its perfection is the fifteenth century. The Renaissance, so rich in the materials out of which what we are pleased to call the higher civilization has been woven, tolled the death knell of the crafts.

In a reprint of Mrs. Everett Green's "Elizabeth Electress of Palatine and Queen of Bohemia" (Dutton), we have another illustration—following the recent lives of Madame, Mère du Régent, and the lives of the Duchess Sophia and the Princess Elizabeth—of a singular revival of interest in that branch of the Stuart family. The present work is taken from Mrs. Green's "Lives of the Princesses of England" (1849-1855), and has been revised in some minor details by the author's niece, Mrs. S. C. Lomas. It is a sympathetic study, based on thorough documentary knowledge, of a life of strange romance and adventure. Mrs. Lomas in the introduction discusses the moot points, whether the Elector Palatine plotted to obtain the crown of Bohemia before his election in 1619, and whether Elizabeth urged him to accept that crown. Mrs. Green had given a negative answer to the first of these questions; her editor maintains that such a view cannot be correct. On the second point Mrs. Green had no doubts, and represented Elizabeth as exerting all her powers to influence her husband to take the throne; Mrs. Lomas brings strong evidence to show that her part in the affair was rather passive than active, taking "a normal and womanly course, probably more in favor of acceptance than against it, but willing to do what her husband and her friends thought right."

The first volume of Prof. Charles Foster Kent's "Student's Old Testament" appeared in 1904, and an interval of nearly three years separates the third volume of the series from the present issue, "The Sermons, Epistles, and Apocalypses of Israel's Prophets" (Scribner). In this fourth volume the canonical prophetical writings appear in a new translation, more literal than the usual versions, arranged in chronological order, with appropriate headings and brief explanatory notes, and with indication of later additions and glosses. The work is the result of great pains and of minute and scholarly examination of the text. Care has been taken to summarize the labors of a large number of critical scholars, including the German authorities. The period covered extends from the earliest literary prophecies to the fragmentary messianic and eschatological discourses embedded in the larger canonical collections. As a handbook for the study of any period of Hebrew prophecy, or for the study of the development of the history and religion of Israel, the work is of great value. Professor Kent is cautious in accepting the emendations of the Hebrew text suggested by Duhm, Martl, and Cheyne.

From Lemcke & Buechner we have received "Lettres d'amour à Aimée d'Alton," by Alfred de Musset. The poet fell in with this descendant of an Irish refugee and was captivated by her desire to reform him. To effect this difficult task, she readily submitted to all incidental intimacies. The affair lasted something more than two years, and furnished the motive for one of his best stories, "Le Fils du Titien." To her, besides the sonnets in the story, was written the well-known poem "Charmant petit moinillon blanc." After the death of Alfred, Aimée became first the mistress and, at fifty, the wife of his brother Paul, whom she outlived. She cherished the memory of what she called "mes Musset," and under advice of M. Troubat gave Alfred's letters under seal to the Bibliothèque Nationale. It seems to us that it was hardly worth Léon Séché's while to rescue them from the files. Aimée's heart was apparently in the right place, but her lover took her with little seriousness. He calls her his doll, and gives the impression of her which is confirmed by the Sèvres statuette forming the frontispiece of this volume. One letter, in which he declines her proposal to marry him and reform him altogether, is true Musset, displaying that severe clairvoyance and self-knowledge which occasionally make a wilful sentimentalist seem almost a man. But, in the main, these are scraps of notes, outcries of a coquettish passion, mere arrangements for rendezvous; the very smallest beer, in short, of what was never a very great passion. To eke out a book these notelets are printed each on its separate page and "Le Fils du Titien" added as an appendix. The material for a minor essay has thus been commercially distended, a proceeding unworthy the standing of the editor and of the publisher, the Mercure de France.

It is surprising how little is known, outside of German circles, of the history and activities of the German organizations in America. It is an interesting fact in institutional history that the patriotic societies formed for the cultivation of the German language and literature (the so-called Sprachgesellschaften) of the seventeenth century should have found a new lease of life in the German societies of America. These associations in the seaboard cities of America arose out of the necessity of aiding needy German immigrants upon their arrival. The oldest of these societies is the German Society of Pennsylvania, founded in 1764. The example of Pennsylvania was followed by Georgia; by South Carolina, with its German Society founded in 1766; by Maryland, with its German Society in 1783; and New York, with its German Society in 1784. The Societies of Pennsylvania and New York have already found their historians in Seidensticker and Eickhoff. The Maryland Society now has its chronicler in Louis P. Hennighausen, whose "History of the German Society of Maryland" (read at the meetings of the Society for the History of the Germans in Maryland, 1909; for sale by W. E.

C. Harrison & Sons of Baltimore), renders valuable service in clearing up the early history of the society, fixing the date of its formation as 1783, and shedding new light upon its earlier Southern predecessor, the German Society of Charleston, S. C., founded in 1766. The author gives a graphic account of the significance of these societies, and of the Maryland one in particular, in bringing about humane legislation on immigration.

"The Hebrew Prophets for English Readers," edited by Francis H. Woods and Francis E. Powell, arranges the Revised Version in poetical form and in sections with brief notes and appropriate headings. These helps, though meagre, are sufficient to bring clear meaning into passages which the reader of the text alone finds obscure. The second volume includes Zephaniah, Nahum, Habakkuk, and Jeremiah (Henry Frowde).

The distinguished German poet and novelist, Dr. Paul Heyse, celebrated on March 15, his eightieth birthday and received warm congratulations from all parts of his fatherland as well as from many other countries of the civilized world. On this occasion he was presented with an album containing the signatures of three hundred admirers, including the German Emperor and other sovereigns, and the most prominent representatives of intellectual life in Germany. Heyse published his first book, the tragedy "Franceska von Rimini," when he was twenty years of age, and since then he has been for sixty years a very productive and popular author, and shows as an octogenarian no diminution of his intellectual abilities and literary qualities. This is evident from his five short stories just published in a volume entitled "Helldunkles Leben."

Charles Edwin Hurd, literary editor of the Boston *Transcript* from 1874 to 1901, and previously connected with other Boston and New England newspapers, died last Thursday at the age of seventy-six. He had published "New England Library of Genealogy and Personal History," and "History of the United States."

Samuel Langhorne Clemens (Mark Twain) died last Thursday evening at Stormfield, his country home in Redding, Conn., at the age of seventy-four. He was born in Florida, Mo., November 30, 1835. Three years later his family removed to Hannibal, Mo., where he attended the common schools, and at the age of twelve became a printer's apprentice in the office of the Hannibal *Weekly Journal*. After learning his trade, he became a tramp printer, and before he was sixteen years old had worked in composing rooms of newspapers in St. Louis, Cincinnati, Philadelphia, and New York. In 1851 he returned to Hannibal, where he again worked as a printer and as a clerk on river boats, and in 1859 he took out a river pilot's license. For a few months in 1861 he served in the Confederate army under Gen. Sterling Price, but in the same year became private secretary to his brother, who had been appointed territorial secretary of Nevada, and went with him to Carson City. He remained here about a year, and then went to Virginia City (in the same Territory), where he became city editor of the *Enterprise* newspaper. For this newspaper he wrote sketches of mining camp characters, and episodes, which he signed with his afterward famous pseudonym, "Mark Twain"—derived from the river leadsman's parlance, and meaning two "marks" on the sounding line, that is, two fathoms.

These signed articles at once attracted attention, and in 1865 he became a member of the staff of the San Francisco *Call*, but remained there only about six months and then went into the mining region of Calaveras County, Cal., where he found much of the material for the book which was to establish his fame in the East, "The Jumping Frog of Calaveras County." In 1866 Clemens went to the Sandwich Islands, of which he wrote sketches for the Sacramento *Union*. He then (1868) engaged to go abroad with a party of tourists and write a descriptive account of his journey for a group of newspapers. Out of these letters he subsequently made his famous book, "Innocents Abroad." Soon after his return he became editor of the Buffalo *Express*, where he remained for two years. Thereafter he went to live in Hartford. In 1884 he invested heavily in the Charles L. Webster Company, a publishing concern, whose failure ten years later swept away virtually all of his means and left him heavily in debt, every penny of which he repaid after a highly successful round-the-world lecturing tour. In 1907 he received the honorary degree of doctor of letters from Oxford University. His publications include: "The Jumping Frog," "The Innocents Abroad," "The Gilded Age" (with Warner), "Roughing It," "Sketches New and Old," "Adventures of Tom Sawyer," "A Tramp Abroad," "The Prince and the Pauper," "The Stolen White Elephant," "Life on the Mississippi," "The Adventures of Huckleberry Finn," "A Yankee at the Court of King Arthur," "The American Claimant," "The £1,000,000 Bank Note," "Pudd'nhead Wilson," "Tom Sawyer Abroad," "Joan of Arc," "More Tramps Abroad," "The Man that Corrupted Hadleyburg," "Christian Science." At the time of his death he was engaged in writing his reminiscences, parts of which have been published in *Harper's Magazine*.

Science.

THE NATIONAL ACADEMY OF SCIENCES.

WASHINGTON, D. C., April 21.

The annual session of the National Academy of Sciences, held in this city from April 19 to April 21, has been one of the largest and most successful meetings held by that body in many years. The printed programme contained thirty-three titles of papers, of which the time permitted presentation of only twenty. Without doubt, the papers of most general interest were those by George E. Hale of the Mt. Wilson Solar Observatory on Solar Magnetism, and on some visual and photographic observations of Mars. With the unparalleled facilities at his command for the study of the spectrum of the sun, Mr. Hale was able to make about two years ago the remarkable discovery of the vortical rotation of sun spots, observed by photographing the spectrum of low-lying iron vapor and the high level clouds of hydrogen present in the sun. Certain separations of spectrum lines showed the presence in these vortices of strong magnetic fields. These fields, Mr. Hale accounts for by the presence in the whirling vapor of electrically charged particles or electrons, the rotation of which constitutes an electric current. This discovery is undoubtedly one of the great achievements of American astrophysics. Mr. Hale also exhibited a number of recent photographs of Mars which, far from showing the geometrical structure or net work of fine lines that have been described by recent Martian observers, failed completely to give any indication of such geometrical structure. We may mention also the paper on the spectrum of Mars as photographed with high dispersion by W. W. Campbell and Sebastian Albrecht of the Lick Observatory. Photographs made last autumn on the top of Mt. Wilson, the highest point in the United States proper, in a dry climate, gave results that have been completely confirmed by observations made this year at Mt. Hamilton, in which the lines due to water vapor or oxygen on Mars were separated from the similar lines due to these substances in the earth's atmosphere, by utilizing the displacement due to the motion of Mars relative to the earth. The result proved that water vapor is absent on Mars, or at least that there must be much less per unit of area than there is over Mt. Wilson or Mt. Hamilton.

A paper of great practical interest was read by Gen. H. L. Abbott on the Hydraulics of the Chagres River, on which there is probably no more competent authority. The disposal of the rainfall by the river, by soaking into the spongy ground and by evaporation, was carefully studied, with the result that it should seem impossible to dispose of the great amount of water precipitated from the enormous freshets on the isthmus without a system of controlling locks, for the reason that for the lowest twenty-seven miles the river has virtually no fall and the water backs up in vast quantities. This, in General Abbott's opinion, effectually disposes of the project of a sea-level canal and confirms the theories of the French engineers and our own expert commission.

The paper by Dr. Franz Boas, of the American Museum of Natural History, on the influence of environment on human type, made with the assistance of the American Bureau of Immigration, led to the conclusion that European types are undergoing profound modification in this country. Measurements of children born within ten years of the arrival of the mother in this country show decided change in the cephalic index (*i. e.*, the ratio of the width to the

length of the head), which has long been regarded as one of the most unchanging of anthropometric characteristics. Although, in general, under the conditions in this country, the physical condition is improved, in the case of Sicilians this is not the case. Nevertheless, the cephalic index in the case of the Jews has decreased by as much as 5 per cent., while the smaller index of the Sicilians has increased by almost the same amount, so that, under American environment, Jews and Sicilians are now nearly alike in this respect. The broad face of the Bohemians has become noticeably narrower in this country.

In geology, C. D. Walcott of the Smithsonian Institution, presented a paper, with many slides, illustrating the development of Olenellus, a fossil belonging to the Cambrian Epoch, on which he is our leading authority. This fossil Trilobite is a crustaccan, much resembling the horse-shoe crab, which was stated to be the dominant organism of its epoch, if not the superman perhaps the super-crab. This Trilobite exists in a stratum of about 5,000 feet in thickness, and Mr. Walcott has not only examined the Rocky Mountains, but has sent expeditions to Sweden, Russia, India, and China. Not the least interesting of his results was the discovery that Trilobites, hitherto supposed to have been blind, possessed a well developed multiple eye, by which they could see as well as present-day crabs.

George F. Becker of the United States Geological Survey, presented a paper on the evidence of denudation in relation to the age of the earth. Mr. Becker's method seems to be entirely new, and consists in finding the amount of salt in the sea and accounting for that salt by the decomposition of feldspathic rocks carried down by the rivers. Some of this salt is returned in the air and falls on the land. Estimating that between 98,000,000 and 142,000,000 of tons of salt are annually washed into the sea, and assuming that the annual amount lost to the land is proportional to the amount remaining, Mr. Becker arrived at the earth's age as between fifty and seventy-five millions of years—a result gratifying to the physicists as coming from a geologist, since fifty years ago Lord Kelvin's estimate of several hundred millions of years was looked upon by the geologists as preposterously short. Mr. Becker has confirmed his calculation by arguments from the cooling of the earth similar to Lord Kelvin's.

S. W. Stratton, director of the Bureau of Standards, gave a very clear and interesting account of the methods of that great physical laboratory belonging to the government. The Bureau is divided into divisions dealing with all questions relating in any manner to measurements connected with (1) mass and length, (2) heat, (3) light, (4) electricity and magnetism, (5) chemistry, (6) engineering problems and the properties of materials. In the past year the Bureau has done work for every other Government bureau, for a large number of universities and scientific institutions, and for many firms and individuals.

A. L. Day, director of the Geophysical Laboratory of the Carnegie Institution at Washington, described his Bureau, which has for its immediate problem the determination of the condition of formation of the rocks found in the crust of the earth. In order to determine their temperatures of formation, not necessarily to their melting points, more exact data were required, according to Mr. Day, than physics can afford the geologist. Great attention has, therefore, been paid to high temperature measurements, in which Mr. Day is an expert. Not only thermal data are requisite, but it is necessary that the minerals examined be in a high state of purity, and for this elaborate chemical researches are necessary. This laboratory is undoubtedly one of the great undertakings of the Carnegie Institution. In this connection may be mentioned the paper of J. M. Crafts, of the Massachusetts Institute of Technology, on the gas thermometer, which he has been developing with wonderful precision for the last thirty years, long before there were either bureaus of standards or geophysical laboratories. As a result of Mr. Craft's researches, we have the method of tempering the glass used in the thermometers of precision which can determine temperatures with an exactness of the one-thousandth part of a degree.

Within a few weeks the Academy has sustained a great loss in the person of its former president, and actual foreign secretary, Alexander Agassiz. Feeling reference was made to his career and interest in the academy by President Remsen, and at the pleasant dinner given by the Washington members, a letter was read from Agassiz to the home secretary, Mr. Hague, proposing to offer a dinner to the Academy at the time of the present session in honor of the eightieth birthday of Dr. Weir Mitchell. Dr. Mitchell responded with much feeling and his health was drunk.

George E. Hale was elected foreign secretary. The following new members were elected: In mathematical astronomy, Forest Ray Moulton of the University of Chicago; in chemistry, William Albert Noyes of the University of Illinois and Thomas Burr Osborne of the Connecticut Agricultural Experiment Station; in palæontology, Charles Schuchert of Yale University; in botany, Douglas Houghton Campbell of Stanford University; in physiology, Jacques Loeb of the University of California; in philosophy, John Dewey of Columbia University; as foreign associate, Giovanni Schiaparelli of Milan. A visit was made to the magnificent new national museum in which, by the courtesy of the Smithsonian, the Academy expects to meet next year.

ARTHUR GORDON WEBSTER.

THE LIFE OF ANTS.

Ant Communities and How They Are Governed. A Study in Natural Civics. By Henry Christopher McCook. Illustrated from Nature. New York: Harper & Bros. $2 net.

In this volume, Dr. McCook presents another of his most interesting and informing studies of the insect world, taking for his subject the ants, which he deals with especially as social animals. The sub-title, "A Study in Natural Civics," refers to what Dr. McCook regards as "parallels, more or less distinct, between the communal actions of ants considered simply as natural history, and the communal actions of man, considered, as all human beings are bound to consider them, in their relation to the highest welfare of the race." On this topic, he says:

> In many of the higher and complex duties of human communities it is impossible that insects should be models for men, in whom there is an element that separates from all other creatures by an impassable gulf. But in the great physical functions of a commune, which are a bond of sympathy between us, we may have something to learn from the ants, who manifestly have kept and still keep the primitive ways of nature more closely than we.

Dr. McCook satisfied himself that an actual communal relation existed between the inmates of a group of seventeen hundred well-developed ant-hills, which he found within a space of fifty acres, near Hollidaysburg, Penna.:

> A small oak-branch, covered with aphides and their attendant ants, was broken from a tree and placed upon a mound twenty rods distant. It was thought that if anything would incite to hostility, it would be the intrusion of members of a separate community upon a congener's feeding grounds. On the contrary, the ants being called from the hill, came out and mounted the branch with the usual excited bearing, and then mingled with its original occupants on friendly terms, and began to feed quietly from the galls and aphides. . . . A spadeful of earth was swiftly cut from the mound, and with the ants, cocoons, and broken cells, thrown into a pail, carried to a cone fifty rods distant and cast upon the surface and around the lower gates. . . . After the first sharp challenges with crossed antennæ the imported ants melted away into the general community as though at home. . . . Thus it appeared (and to the writer it was then an astounding revelation) that among the myriads of creatures occupying these more than one thousand seven hundred mounds there was a complete fraternity—if, indeed, they were not one mighty confederacy! Here was a republic which in

the number of its separate states—for every mound was an independent community of ants—and in the multitude of its total population exceeded the most sanguine prophecy of the future of the American republic.

Dr. McCook calls attention to "a well-defined division of labor among the worker castes, viz., workers-major, workers-minor, and minims or dwarfs." And there are sentinels or policemen, masons or builders, foragers, nurses, and courtiers or queen's body-guard, but "apparently all branches of service have recruits from all the castes, and these pass from one to another at will. On the surface (as far as human intelligence discerns) it is a 'go-as-you-please' arrangement, which nevertheless is dominated by some occult principle that brings orderly results out of seeming chaos." And our author makes the further remarkable observation that "among these millions of citizens, there is not one criminal, not one degenerate! I do not recall, in all my long and varied observations, a single example of an ant whose actual offending called for the administration of civil punishment." Here, he says is "the perfect social commune whose citizens are all perfect in that 'righteousness which is of the law.'" Our enormous office buildings are, indeed, wonderful structures (and are often aptly likened to ant-hills), but as mere achievements in building, relative to the size of the builder, they are far less remarkable than ant architecture:

> Those who are curious in such comparisons find grounds here for a striking parallel between the achievement of an ant three-eighths of an inch high (long), and of a man one hundred and seventy-six times as high (five and one-half feet.) Were we to reckon a proportionate rate of progress between the two on the basis of height, one man would have to be credited with a storied structure 1,408 feet deep. Apart from such fanciful comparisons, it is certainly well calculated to excite our wonder that such insignificant creatures can, by their united exertions, bring about results so vast, unaided by mechanical contrivances.

And as to the physical strength of the ant, Dr. McCook observes:

> I have often admired the vigor and skill shown by baggage-porters in shouldering and bearing up several flights of stairs the immense trunks which American ladies take with them on their travels. But here, if we may be indulged in the comparison, is an insect three-eighths of an inch long (and the worker-minors are shorter), who can carry up sharp inclines and perpendicular surfaces, over distances three-hundred times its length, a burden six to ten times its weight. If, as heretofore, we estimate the average man at one hundred and fifty pounds in weight, our baggage-porter would needs carry a half-ton trunk up one-tenth of a mile of stairway to meet on equal footing the emmet athletes of the occident anthills!

Readers who are familiar with Dr. McCook's manner of approaching his subjects will not need to be told that he does not indulge many of these popular comparisons, which, he is at pains to remark, "are apt to be superficial and misleading," but the foregoing ones seem quite admissable, and actually instructive.

Only in this general way can we indicate Dr. McCook's method of treating this most interesting subject in natural history. Throughout he is at once the careful observer who sees details in relation to essentials, and presents the results of his observations in simple and lucid description which bears all the evidence of versimilitude. In this manner, he treats the Feeding of the Commune, The Language of Ants, and Other Insects, How Ants Communicate, Female Government in Ant-Communities, Warrior Ants, and Their Equipment for War, How Ants Carry On War, The Founding of Slave-Making Ant Communes, and Problems of Sanitation and Personal Benevolence. The illustrations, which are clearly drawn sketches, are of great assistance.

Drama.

With all its artificiality and sacrifice of sense to sentiment, the "Caste" of Tom Robertson is still an effective play, owing to its cleverly devised situations, its romantic story, and the vitality of its personages. It has now been revived in the Empire Theatre, in this city, with what is described as an "all-star cast," but the representation, though good as a whole, is not equal to several of those seen in this city in former years. Judged by modern standards of motive and construction, the piece is thin in substance and violent in mechanism, and the only valid reason for its revival is to furnish a specimen of what was best in mid-Victorian comedy. The characters and the atmosphere now are of more importance than the play. These have not been reproduced with general success at the Empire. As a rule the plebeians are more satisfactorily embodied than the aristocrats. The Eccles of G. P. Huntley is an exceedingly humorous bit of low comedy, but is inferior to the impersonations of such men as Honey and Davidge both in variety and force. These actors were wont to infuse a dash of passion into their drunken ravings which suggested the power for mischief existing in just such degraded agitators. Grahame Brown, as Gerridge, was a typical workman, if not a typical cockney. Miss Elsie Ferguson played Esther with pleasant simplicity. She did not make the mistake of adopting a manner altogether superior to her supposed station, as other Esthers have done before her, and in the crucial situations displayed natural and sympathetic emotion. The Polly of Marie Tempest, though amusing, and very smart in the theatrical sense, was too full of manifest artifice to create realistic illusion. The youthful, sanguine, and ardent George D'Alroy, in the hands of Edwin Arden—a player of a most inflexible style—assumed the grave and resolute habit of middle age. Julian Royce was partly successful in catching the languid, "haw-haw" manner of the heavy cavalryman, Hawtree, but failed to suggest the real man beneath the foppish exterior. Maud Milton gave to the Marquise an affected air, but no real distinction. The revival was received with much favor, and affords as good theatrical entertainment as can now be found in the city.

Ludwig Fulda's "Das Exempel" (imported by G. E. Stechert & Co.) is an unpretentious play rising but little above the clever mediocrity of Blumenthal and Kadelburg. The theme is interesting and timely, illustrating in lively fashion the theories of love and marriage which the ultra-new women of Germany attempt to put into practice. To show their ineptitude the author needs to present the heroine as undergoing a change in character; but instead of having this change come about naturally from within, he resorts to espionage and other hackneyed theatrical tricks, and the play, which had in it the material for a capital modern comedy, ends like a hundred others built upon a similar motive.

"Sieben Einakter" is a volume of enjoyable and actable little plays by Ludwig Fulda, recently imported by G. E. Stechert & Co., all of which had been separately published before.

Richard Dehmel is not contented with being the foremost poet of Germany, now that Liliencron is gone, but is reminding his admirers of the fact, that he, too, aspires for dramatic honors. The new edition of "Der Mitmensch," which comes from S. Fischer of Berlin, is considerably changed from the first version published in 1895, and played by an academic society some years ago. The work was then pronounced a dismal failure, and when performed in its present form at the beginning of this season gave the same impression. The paradoxical treatise, "Tragik und Drama," which serves as preface to the book, is likely to interest more than the play itself. Dehmel sees in the decadence of pure tragedy a result of our monistic reading of life which knows no complete annihilation but sees in every death a new birth. He maintains that the headstrong characters which are brought into drama, with all their irrational passion for power, simply to justify the working of tragic fate, are out of place in our time:

> In spite of Nietzsche, it is no longer great to rise beyond one's self and to die in the attempt. For that is something man shares with every moth that is burnt and every bubble that bursts. Of course, we cannot undo the fate that rules everything, but for that very reason it is no longer an heroic manifestation of the human will blindly to rush beneath its wheels. . . . Therefore, we have no longer the spontaneous, blindly instinctive reverence for the sacred desire of vengeance, which is satisfied by tragedy; we feel superior when we punish by contempt, and this moral sentiment is æsthetically more related to comic or tragic malice.

Formerly, Herr Dehmel continues, the question was asked: "What is life worth to us?"; to-day it reads: "What are we worth to life?" There is as much unhappiness in the world as ever, and always will be, but "it will not always be the

acme of nobility to take that fact tragically."

Carl Hauptmann has published a volume of plays symbolically entitled "Panspiele" (München: G. D. W. Callwey). The friends which the author made during his stay in American will find in this book the little masterpiece entitled "Im goldenen Tempelbuche verzeichnet," which made such a profound impression, when read in the German theatre in New York. This dramatic poem in three scenes, founded upon a Japanese sketch, and, as he indicates, "to be played behind veils," is a gem of that poetic impressionism in which he excels all his German contemporaries. In dignity and purity of diction and delicacy of imagery it is perhaps unequalled by anything that has recently come from a German pen. The book admirably reflects the quaint personality of the author and is remarkably varied in mood and manner. Nothing more grimly humorous could be conceived than the one-act comedy "Der Antiquar," with its original treatment of a triangular relation. The tragicomedy called "Fasching" is vibrant with carnival joy, and like the preceding has some clever bits of characterization. "Frau Nadja Bielew" is unsatisfactory. It is one of those works in which the author's mannerisms counteract the effect he intends to produce.

Music.

The Rhythm of Modern Music. By C. F. Abdy Williams. New York: The Macmillan Co. $1.50 net.

Rhythm is what is left of music if you take away melody and harmony. Tap a tune on the table and you have its rhythm unalloyed. The Salvationist's drum represents this element of music in its most elementary form; from this to the complex combinations of Liszt, Chopin, and Strauss there is the same progress as from the simple chords of a hymn tune to the complicated harmonies of Wagner's "Tristan." The object of Mr. Williams in this book is to show that such rhythmic complications and elaborations are not due to a desire to do anything out of the common, but are the genuine art expressions in a highly civilized and complicated condition of society.

In the days when instrumental music had not yet become an independent art the church looked with disfavor on rhythm because of its association with worldly pleasures, especially the dance; yet that people felt the want of it is shown by the edicts forbidding the playing of dance music on the organ. An impediment to its development lay in the fact that the organ was the first instrument to attain artistic maturity, and the organ lacks accent, which is the soul of rhythm. Accent was also missing in the harpsichords and clavichords, and it was only when these were developed into the pianoforte, on which, as the name indicates, one could play loud or softly at will, that rhythm in art music began to come into its own. Bach's fugues are full of rhythmic interest; "with him," as the author remarks, "rhythm is not merely a framework on which to build harmonic and contrapuntal combinations, but he makes it more or less a living thing, and greatly adds thereby to the power of instrumental music."

Thenceforth the development of this element was more rapid, in spite of the opposition of conservatives who tried to stop the evolution of rhythm as well as that of harmony. Schubert was found fault with because his phrases did not always conform to the orthodox four-measure construction. But Schubert was simply in advance of his age; the irregularity of some of his music is to us one of its chief charms. A further development lay in the simultaneous use of two or more different rhythmical motives—a proceeding which often results in sublime effects. Modern music is likely to develop still further in this and other directions, some unthought of hitherto, others simply an assimilation of old rhythms from exotic sources; the five-four rhythm, for example, which is so rare in our music as to seem eccentric, was in favor with the ancient Greeks and is found in the folk music of Turks, Finns, negroes, Basques, and in Bavarian and Bohemian dances. In contrast with these we have also, in Strauss and others, passages of rhythmless music which seem daring, but find their justification in the "programme" they illustrate. In these diverse ways rhythm, from being merely an element of form, has become, in our days, "a very powerful means of expression."

To prove this last assertion is the main object of Mr. Williams's book. He has much to say about accents, phrasing, anacrusis, tempo, pauses, rests, staccato, rubato, and divers other points; but the value of his volume lies chiefly in the emphasizing of this expressional aspect of rhythm. As he well says: "So subtle is the art of music, that the undue lengthening or shortening of a single note will sometimes alter the whole character of a phrase." Players as a rule pay much more attention to melody and harmony than to rhythmic subtleties, and so do most listeners. All of these will find this book a valuable aid to the appreciation of modern music. It would be more valuable still if the author had shown more catholicity in the choice of his abundant musical illustrations. One may pardon in an English writer the inclusion of two English works among the six which he subjects to a detailed rhythmic analysis, but it is annoying to find almost all the shorter illustrations taken from the works of Brahms, while Wagner, Liszt, and Chopin, who are rhythmically even more remarkable and who preceded Brahms in various innovations, are almost ignored. Some of the points made could have been driven home more effectively by citations from Liszt's book on Hungarian music and by the remarks of Schumann and Wagner on the tyranny of the bar in musical notation.

Art.

Manet and the French Impressionists. By Théodore Duret. Forty illustrations, including four original etchings. Philadelphia: J. B. Lippincott Co. $3.75 net.

So much sheer rhetoric and flummery has been written about the Impressionists that it is a pleasure to find, translated and in amplified form, a book, in which objective common sense prevails. M. Duret is, in the main, the annalist, not the critic of the movement. We follow, year by year, the work of Manet, Monet, Sisley, Renoir, Berthe Morisot, Cézanne, and Guillaumin, hear of their exhibitions and disastrous auction sales, mark the attitude of the public and the critics, rejoice in the appearance of an intelligent patronage—in general, deal with the externals of the movement from the beginning until to-day. M. Duret nowhere undertakes a real analysis of the style. For him, these friends and comrades were merely fine enthusiasts with a love of out-of-doors, a predilection for the bright colors, and a loathing of dark shadows and formal composition. One could read the book without learning of Manet's doctrine of planes, or Monet's theory of the vibratory quality of juxtaposed colors. For such matters, one must still go to Geffroy, George Moore, MacColl, or Brownell.

Possibly because of these limitations, this book is wholesome. It seems to normalize facts that have been presented with undue mystery. We see simply a group of fellow-minds, struggling in quite a human way for publicity and sales, sharing a nonchalant attitude toward composition and an exquisitely experimental manner of applying bright colors to canvas. It is well to be reminded that Cézanne was a provincial, a conservative, and a devout Catholic. In these men, who have been travestied as traitors or heroes, there was a quite usual work-a-day streak. They merely happened to like beautiful color which the world, through unfamiliarity, had come to scorn, and to affect sunlit subjects which the routine painters dared not undertake. It was unquestionably Manet who proved that a finer structure could be got out of well-balanced planes of bright color than out of darkly shadowed forms. But this Fragonard, in a less strenuous spirit, understood, and Delacroix quite scientifically. Indeed, so far as color goes, the Impressionists were in the true French tradition, the

Institute being astray. The weakness of the new school was its disregard of composition, form, and all the reflective qualities of painting. In their passion for atmosphere, all mere objects became indifferent. Just enough suggestion of form to supply solar reflections or to hang saturated vapors upon sufficed these innovators. The result is a fusion and liquidation of the data of landscape which, while not without its beautiful and distinguished quality, represents an excessive sacrifice to the notion of aerial envelopment. The landscape painters of China and Japan get more exquisitely, by fine placing and indication of objects, pretty much all the effects which the Impressionist gains by effacing them and generally over-manipulating the surfaces. "The sensation which they wished to convey," writes M. Duret, "was that of movement and light, and they could often only achieve this by leaving forms and outlines in a state of indecision and flux." The answer to this apology is that the balance of excellence seems to be shifting to those devotecs of impressionistic color who retained certain traditions of draughtsmanship and composition. Unless it be Cézanne, the most strenuous executant of the group and the least bound by its formulas, no one of them seems likely to stand the test of time so long as their forerunner Manet, and such remote allies as Degas, Besnard, at his rare best, and Mary Cassatt. All of these, be it noted, are in a considerable degree traditionalists. Cézanne was a true archaic, painting as if the world began with him. He seems more significant than the group which built up a formula out of the practice of Manet and the scientific theories of Monet.

The future may possibly regard the movement as a magnificent aberration. It will not fail to note that such a revolution was necessary, and that the art of painting has been thereby transformed and greatly benefited. We may expect, in fact begin to see, a saner vision of landscape prevailing. But, as M. Duret says, pretty much everybody to-day is more or less an impressionist. The word "may be said to be applied to all artists whose works reveal an instantaneous rendering of nature, by means of bright coloration freed from conventional shadow." Let us amend by saying that this instantaneous rendering of nature is a pure myth—merely a forcible antithesis by which to condemn the usual studio procedure. Let us say swift, instead of instantaneous, and we shall be near the fact. For purposes of observation and preliminary study, the value of such immediacy of vision and celerity of notation cannot well be exaggerated. But the task of the artist will, as it has ever been, be to revise, combine, and articulate these impressions. In such a process, there should be not merely no attenuation, but actual enrichment. The fact that these valiant workers under the sun have not accepted this truth has limited their achievement. They abound in admirable sketches, in suggestions of evanescent charm, they have enlarged our vision; whether any or all of them have produced anything as significant and permanently valuable as a fine Constable or Roussean, may well be doubted.

However that may be, no one who reads in M. Duret's pages the honorable record of the Impressionists can fail to be moved to admiration. Here are many illustrations, which often give a blurred effigy of the originals. Only the figure painters abide this transcription successfully. Four original etchings by Manet, Morisot, and Renoir (2) are actual documents of this art. The letter press and whole makeup of this in quarto are exemplary. J. E. Crawford Flitch's translation reads like an original. An appendix with a catalogue of Manet's works is of evident utility. It is a book which every admirer of the school will wish to place beside those more critical volumes, the most important of which have been mentioned above.

In recent numbers of the *American Architect*, William H. Goodyear has largely supplemented his studies of concealed curves, asymmetries, and similar refinements in mediæval architecture. He reviews as well certain polemical aspects of the question. Admitted by Violet le Duc and Ruskin, and perceived by Choisy, this principle of calculated asymmetry has been worked out elaborately by Professor Goodycar. It was he who invented the most expeditious method of ascertaining divergences from the perpendicular. By photographing across a plumbline with a carefully levelled camera all slanting columns or walls are immediately revealed, and the amount of the divergence may he roughly calculated by the use of a surveyor's disk or by comparisons with minor features of the building of which the dimensions are known. In many quarters the value of Professor Goodyear's investigations was generously recognized. His numerous honorary memberships in European learned bodies attest it. Among foreign critics, Baron Geymüller and Professors Choisy and Cloquet; among Americans the late Russell Sturgis, A. L. Frothingham, and many practising architects have accepted his views, some have put the rediscovered refinements into practice. A few architects, particularly in England, have declared that the discoveries were illusory, representing either false photographic observations or accidental irregularities, due to settling or other damage to the building. Against the theory of settling weighs heavily the fact that an outlean, often amounting to a yard or more in the walls of a nave, must, if due to settling, have caused extensive dislocation of the vaulting. The most notable cases of outlean show no such damaged vaults. Furthermore, it is significant that the titular architects of such buildings as the cathedrals of Pisa, Venice, Rheims, Amiens, with other church architects, have accepted Professor Goodyear's views. These gentlemen are in a position to know if the noted irregularities in the buildings under their charge are or are not due to settling. A few critics have objected to Professor Goodyear's method of sighting with a camera across a plumbline, alleging that imperfect levelling of the camera has produced distortion of the perspective. They forget that any camera error that made a perpendicular pier seem to lean would affect a plumbline to precisely the same degree. In short, failure to level the camera would penalize itself. We think that those who have given any attention to Professor Goodycar's photographic enlargements have had to admit the demonstrative character of the evidence. A certain number of opponents hold their ground by the simple expedient of declining to consider the data. In the *American Architect* for March 16 are some peculiarly instructive plates on a large scale, mostly from Rheims and Amiens, but a serious student should consult the photographs themselves at the Museum of the Brooklyn Institute.

The extent of Mr. Goodyear's researches may be suggested by the following figures:

> Some 78 [buildings] are offered by the exhibition as showing presumably convincing instances of constructive asymmetry. Among these buildings there are 19 which represent perspective illusions or predetermined arrangements which appear to have that result, whatever the purpose may have been. There are 15 churches which represent asymmetries of arcades or other demonstrably purposed asymmetries, aside from those of the perspective illusions or of the outline ground plan. There are 18 Italian churches which represent oblique and asymmetric plans, not including those with bent or curving lines. There are seven mediæval churches with interior bends of alignment not found on the exterior. There are 14 mediæval buildings which represent horizontal curves of alignment as distinguished from bends. There are three mediæval churches which exhibit curves or bends in elevation. There are seven ancient temples which represent horizontal curves, either in plan or in elevation. There are 32 churches which represent the widening refinement.
